# PATENTS

## NOTICES

### Erratum

All references to Patent No. 2,767,779 to Kaare Krogh, for Slipcover, appearing in the OFFICIAL GAZETTE of Oct. 23, 1956, should be deleted as the application was withdrawn from issue and the patent was not issued.

### Adjudicated Patents

(C. A. Pa.) Nachtman Patent No. 2,240,265 (204—28) for a method of continuously tin plating ferrous metal stock. Claims 1 and 2 *Held* invalid. *Nachtman* v. *Jones & Laughlin Steel Corporation*, 235 F.2d 211; 110 USPQ 167.

(D. C. Ill.) Borkland Patent No. 2,357,806 (18—56), for a method of making cupped formations of thermoplastic sheet material, *Held* invalid. *Borkland* v. *Pedersen et al., doing business as Paramount Plastics Co.*, 142 F. Supp. 652; 109 USPQ 481.

(C. A. Pa.) Nachtman Patent No. 2,459,674 (266—3), for continuous tinplate brightening apparatus, *Held* invalid. *Nachtman* v. *Jones & Laughlin Steel Corporation*, 235 F.2d 211; 110 USPQ 167.

(C. A. Pa.) Nachtman Patent No. 2,576,074 (204—28) for method and apparatus for continuous strip metal treatment. Claims 8 and 9 *Held* invalid. *Id.*

(C. A. Pa.) Nachtman Reissue Patent No. 20,788 (204—28), for a method of plating steel, *Held* invalid. *Id.*

(D. C. Ill.) Borkland Reissue Patent No. 23,171 (18—19), for apparatus for and method of forming sheet material, *Held* invalid. *Borkland* v. *Pedersen et al., doing business as Paramount Plastics Co.*, 142 F. Supp. 652; 109 USPQ 481.

### Disclaimers

2,730,143.—*John L. Ryde*, Los Angeles, Calif. POWER SAW CHAIN. Patent dated Jan. 10, 1956. Disclaimer filed Oct. 8, 1956, by the assignee, McCulloch Motors Corporation.

Hereby enters this disclaimer to claims 1 to 6, inclusive, of said patent.

2,733,196.—*Harold Hillier* and *Frank Bruce Ling*, Glasgow, Scotland. TREATMENT OF SEA WATER FOR EVAPORATING PLANTS. Patent dated Jan. 31, 1956. Disclaimer filed Sept. 27, 1956, by the assignees, *G. & J. Weir Limited*.

Hereby enter this disclaimer to claims 1 to 8, inclusive, of said patent.

2,743,059.—*Roy C. Gauger*, Rochester, N. Y. DEVICE FOR MEASURING GAS PRESSURES. Patent dated May 8, 1956. Disclaimer filed Oct. 2, 1956, by the assignee, *Consolidated Electrodynamics Corporation*.

Hereby enters this disclaimer to claims 1 and 2 of said patent.

### Patents Available for Licensing or Sale

2,748,568. Fuel Injection Arrangement in Vortex Air Stream in an Annular Combustion Chamber Surrounding a Gas Turbine. David Dutton Budworth, Altyre House, Great Horkesley, Essex, England. Correspondence to Michael S. Striker, 511 Fifth Ave., New York 17, N. Y.

2,760,724. Thermostat Mounting. Anna Swietek, 64 Hope Ave., Passaic, N. J.

2,763,092. Rat Trap. George T. Sheridan, P. O. Box 459, Fort Madison, Iowa.

General Electric Company is prepared to grant nonexclusive licenses on reasonable terms under the following 26 patents to domestic manufacturers.

Applications for licenses under the following 16 patents may be addressed to: General Electric Company, Transformer Division, 100 Woodlawn Ave., Pittsfield, Mass., Attention Patent Counsel.

2,246,159. Electrical Coil.
2,263,319. Bushing Terminal Guard.
2,337,872. Protective Device.
2,340,099. Thermal Switch.
2,344,334. High Voltage Winding.
2,374,055. Thermal Responsive Devices for Electrical Coils.
2,435,486. Operating Mechanism.
2,441,457. Bushing Construction.
2,447,883. Electrical Induction Apparatus.
2,458,948. Protective Device.
2,466,448. Combined Core and Coil Clamp.
2,467,377. Electrical Induction Apparatus.
2,490,506. Distribution Transformer Coil Support.
2,547,675. Magnetic Core.
2,554,185. Multisectioned Radiator.
2,698,429. Load Indicator.

Applications for license under the following patent may be addressed to: General Electric Company, Aircraft Gas Turbine Division, Cincinnati 15, Ohio, Attention Counsel.

2,722,803. Cooling Means for Combustion Chamber Cross Ignition Tubes.

Applications for licenses under the following 3 patents may be addressed to: General Electric Company, Component Products Division, 1635 Broadway, Fort Wayne, Ind., Attention Patent Counsel.

2,750,137. Motor Mounting.
2,751,455. Magnetic Centrifugal Device.
2,752,463. Switch.

Applications for licenses under the following 6 patents may be addressed to: General Electric Company, Patent Counsel, Measurements and Industrial Products Division, 920 Western Ave., West Lynn 3, Mass.

### New Applications Received During September 1956

| | |
|---|---|
| Patents | 5,343 |
| Designs | 336 |
| Plants | 11 |
| Reissues | 10 |
| Total | 5,700 |

### Issue

| | | |
|---|---|---|
| Patents | 805 | No. 2,769,173 to No. 2,769,977, incl. |
| Designs | 71 | No. 179,107 to No. 179,177, incl. |
| Plants | 1 | No. 1,526 |
| Reissues | 2 | No. 24,235 to No. 24,236, incl. |
| Total | 879 | |

2,548,502. Resistance Strain Gauge and Method for Making Same.
2,669,786. Attitude Indicator.
2,730,813. Gyroscope.
2,737,053. Gyro Setting Device.
2,744,218. Sealed Rectifier Unit and Method of Making the Same.
2,751,528. Rectifier Cell Mounting.

# CONDITION OF PATENT APPLICATIONS AS OF SEPTEMBER 28, 1956

| | |
|---|---|
| Total number of pending applications (excluding Designs) | 217, 262 |
| Total number of pending Design applications | 6, 321 |
| Total number of applications awaiting action (excluding Designs) | 120, 204 |
| Total number of Design applications awaiting action | 2, 772 |
| Date of oldest new application | Apr. 29, 1955 |
| Date of oldest amended application | May 18, 1954 |

| VII. KAUFFMAN, H. E., HEATING AND COOLING, PLASTIC SHAPING AND COATING, SEPARATION AND MIXING, BODY TREATMENT AND CARE. | 3, 15, 19, 25, 30, 32, 49, 55, 67. |
| CL. GORECKI, G. A., ARTS UNDERGOING RECLASSIFICATION AS LISTED UNDER CLASSIFICATION DIVISIONS. | I, II, III, IV, V. |

| DIVISIONS, EXAMINERS AND SUBJECTS OF INVENTION (Roman numerals in parentheses indicate Examining Group) | Oldest Application: New | Amended |
|---|---|---|
| 1. (VI) GOLDBERG, A. J., Brakes; Excavating; Planting; Plant Husbandry; Scattering Unloaders | 10-21-55 | 11-9-54 |
| 2. (III) HERRMANN, D., Fishing, Trapping and Vermin Destroying; Presses; Tobacco; Textile Wringers | 12-23-55 | 6-7-55 |
| 3. (VII) LE ROY, C. A., Metal Founding and Treatment; Metallurgy (Process and Apparatus); Alloys | 1-23-56 | 11-8-54 |
| 4. (VI) FALLER, E. A., Hoists; Power Driven Conveyors; Handling Apparatus; Elevators; Feeding of Indefinite Lengths | 12-28-55 | 1-28-55 |
| 5. (VI) ROBINSON, C. W., Harvesters; Potato Diggers; Stalk Pullers and Choppers; Stone Gatherers; Threshing; Knotters; Animal Husbandry; Bee Culture; Dairy; Butchering; Vegetable and Meat Cutters and Comminutors; Fences; Gates | 12-12-55 | 5-3-55 |
| 6. (I) SURLE, H., Carbon Chemistry (part), e. g. Natural Resins, Proteins, Heterocyclic Amides, Amines, General Organic Processes | 7-1-55 | 3-10-55 |
| 7. (IV) GONSALVES, J. E., Optics, Photographic Apparatus | 12-9-55 | 1-3-55 |
| 8. (V) LEWIS, R. O., Beds; Chairs and Seats; Cabinets; Tables; Miscellaneous Furniture | 7-14-55 | 9-22-54 |
| 9. (VI) BRANSON, J. H., Pumps; Fans; Turbines | 12-30-55 | 12-14-54 |
| 10. (VI) BOYD, S., Firearms; Ordnance; Ammunition; Explosive Charge Making | 9-21-55 | 1-17-55 |
| 11. (IV) BENHAM, E. V., Boots, Shoes and Leggings; Shoe and Leather Manufacture; Button, Eyelet and Rivet Setting; Nailing, Stapling and Clip Clenching; Card, Picture and Sign Exhibiting; Cultery; Cleaning and Liquid Treatment of Solids | 2-3-56 | 4-6-55 |
| 12. (III) SPINTMAN, S., Machine Elements; Engine Starters; Interrelated Clutch and Motor Controls | 10-10-55 | 7-12-54 |
| 13. (III) BEALL, T. E., Gear Cutting; Electric Lamp and Tube Manufacture; Needle and Pin Making; Metal Working (part), e. g. Special Work, Forging, Plastic Working, Drawing, Sawing, Milling, Planing, Turning | 12-5-55 | 10-4-54 |
| 14. (III) MANIAN, J. C., Metal Working (part), e. g. Sheet Metal, Wire Bending, Miscellaneous Processes, Assembly and Disassembly Apparatus; Wire Fabrics; Air Brakes | 9-20-55 | 9-17-54 |
| 15. (VII) BRINDISI, M. V., Plastics; Plastic Block and Earthenware Apparatus; Glass | 1-3-56 | 9-23-54 |
| 16. (II) LOVEWELL, N. N., Television; Telephony; Recorders | 9-26-55 | 7-30-54 |
| 17. (IV) LEIGHEY, R. A. (HOFFMAN, R. J., acting), Paper Manufactures; Packaging; Typewriters; Printing; Type Casting and Setting; Sheet Material Association or Folding; Sheet or Web Feeding | 11-14-55 | 1-7-55 |
| 18. (VI) BLUM, A., Power Plants; Fluid Transmissions; Servomotor Systems; Jet Motors; Combustion Turbines; Speed Responsive Devices | 11-16-55 | 11-30-54 |
| 19. (VII) PATRICK, P. L., Stoves and Furnaces; Boilers; Concentrating Evaporators; Fluid Fuel Burners | 12-14-55 | 4-25-55 |
| 20. (V) BROWN, L. M., Miscellaneous Hardware; Closure Fasteners; Locks; Safes; Bank Protection; Bread, Pastry and Confection Making; Tents and Canopies; Umbrellas; Canes; Undertaking | 1-10-56 | 1-3-55 |
| 21. (III) MADER, R. C., Textiles | 12-5-55 | 1-12-55 |
| 22. (VI) MARLAND, M. L., Aeronautics; Boats; Buoys; Ships; Marine Propulsion; Propellers; Windmills; Fluid Diaphragms and Bellows; Boring and Drilling | 11-25-55 | 11-9-54 |
| 23. (II) ANDRUS, L. M., Cash and Fare Registers; Calculators and Counters; Education | 8-8-55 | 5-18-54 |
| 24. (III) DRACOPOULOS, P. T. (HICKEY, T. J., acting), Apparel (except Corsets and Brassieres); Apparel Apparatus; Sewing Machines; Textiles, Ironing or Smoothing; Clutches and Power-Stop Control | 1-9-56 | 10-14-54 |
| 25. (VII) NEVIUS, R. D., Coating—Processes, Miscellaneous Products and Apparatus; Distillation; Wood Treating Apparatus | 10-27-55 | 1-3-55 |
| 26. (II) YOUNG, R. R., Electricity—Generation, Motive Power, Transmission Systems, Voltage and Phase Control Systems, Furnaces, Battery Charging and Discharging, Arc Lamps, Prime Mover Dynamo Plants, Elevators (part), e. g. Miscellaneous Electric Control Mechanism | 1-31-56 | 7-26-55 |
| 27. (IV) JAMES, S., Brushing, Scrubbing and General Cleaning; Brush, Broom and Mop Making | 1-9-56 | 3-11-55 |
| 28. (VI) BRAUNER, R. H., Internal Combustion Engines; Expansible Chamber Motors; Fluid Servomotors; Spring, Weight and Animal Powered Motors; Cylinders; Pistons; Drive Shafts; Flexible-Shaft Couplings; Chucks or Sockets; Chute, Skid, Guide and Way Conveyers; Fluid Current Conveyers; Pressure-Modulating Relays; Pneumatic Dispatch; Store Service; Wheel Substitutes | 10-10-55 | 1-10-55 |
| 29. (V) HABECKER, L. B., Tools; Woodworking; Button, Barrel and Wheel Making; Rubber Tire Removing Tools; Washing Machines; Baggage; Cloth, Leather and Rubber Receptacles; Package and Article Carriers | 11-23-55 | 2-21-55 |
| 30. (VII) O'LEARY, R. A., Refrigeration; Heating Systems; Automatic Temperature and Humidity Regulation, Thermostats, Humidistats; Illuminating Burners; Miscellaneous Heating | 4-2-56 | 5-9-55 |

| DIVISIONS, EXAMINERS AND SUBJECTS OF INVENTION (Roman numerals in parentheses indicate Examining Group) | Oldest Application | |
|---|---|---|
| | New | Amended |
| 31. (I) HUTCHISON, E. W., Carbon Chemistry (part), e. g. Urea Adducts, Silicon Containing Carbon Compounds, Hydrogenation of Carbon Oxides, Partial Oxidation of Non-Aromatic Hydrocarbon Mixtures, Hydrocarbons, Halogenated Hydrocarbons | 9-9-55 | 5-17-55 |
| 32. (VII) BERMAN, H., Gas and Liquid Contact Apparatus; Heat Exchange; Gas Separation; Agitation; Self Proportioning Fluid Systems; Liquid Level Responsive Systems; Fire Extinguishers | 1-9-56 | 6-13-55 |
| 33. (V) MUSHAKE, W. L., Bridges; Hydraulic and Earth Engineering; Building Structures; Roads and Pavements | 12-13-55 | 9-14-54 |
| 34. (IV) SAPERSTEIN, S., Railways—Draft Appliances, Switches and Signals, Surface Track, Rolling Stock, Track Sanders; Electricity, Transmission to Vehicles; Dumping Vehicles; Vehicle Fenders; Hand and Hoist Line Implements | 11-22-55 | 9-13-54 |
| 35. (IV) BROMLEY, E. D., Dispensing; Fluent Material Handling, Filling; Toilet, Kitchen and Table Articles | 1-18-56 | 8-16-55 |
| 36. (V) McFADYEN, A. D., Measuring and Testing | 9-26-55 | 9-8-55 |
| 37. (II) LEVY, M. L., Electricity—Switches, Welding, Heating | 10-14-55 | 3-11-55 |
| 38. (I) MARMELSTEIN, N., Carbon Chemistry (part), e. g., Azo, Carbocyclic or Acyclic Compounds (part), e. g. Anthrones, Triarylmethanes, Esters, Acids, Ketones, Aldehydes, Ethers, Phenols, Alcohols | 1-5-56 | 6-6-55 |
| 39. (IV) WEIL, I., Fluid-Pressure Regulators; Valves; Fluid Handling (except Pressure Modulating Relays, Self-Proportioning Systems, Float Valves, Diaphragms and Bellows) | 1-3-56 | 10-1-54 |
| 40. (V) DRUMMOND, E. J., Receptacles—Metallic, Paper, Wooden, Glass; Special Receptacles and Packages | 1-3-56 | 8-1-55 |
| 41. (V) GURLEY, R. B., Coin Controlled Apparatus; Dispensing Cabinets; Coin Handling; Mail, Fare or Other Collection Boxes or Chutes; Buckles, Buttons and Clasps; Racks; Fire Escapes; Ladders; Scaffords | 7-20-55 | 9-3-54 |
| 42. (II) MARANS, H., Electric Signaling; Signals and Indicators; Telegraphy; Electrical Connectors | 4-29-55 | 10-19-54 |
| 43. (I) ARNOLD, D., Medicines, Poisons, Cosmetics; Sugar and Starch; Skins, and Leathers; Preserving, Sterilizing and Disinfecting (except Wood Treatment Apparatus) | 9-26-55 | 1-28-55 |
| 44. (II) EVANS, N. H., Antennas; Automatic Pilots; Directive Radio Systems; Mass Spectrometers; Nuclear Batteries; Nuclear Resonant Devices; Neutron Detecting and Measuring; Radar ;Sonar; Torpedoes | 6-2-55 | 6-18-54 |
| 45. (VI) MANIAN, J. A., Wheels, Tires and Axles; Railway Wheels and Axles; Lubrication; Bearings and Guides; Belt and Sprocket Gearing; Spring Devices; Animal Draft Appliances | 10-26-55 | 2-9-55 |
| 46. (I) WILES, W. G., Actinide Series (e. g., fissionable) Compounds; Sintered Metal Stock; Explosives; Power Plants (part); Metallurgy (part); Surgery (part); Radioactive Medicines; Irradiation Chemistry; Carbon Chemistry (part) | 7-26-55 | 1-10-55 |
| 47. (VI) KANOF, W. J., Mining, Quarrying, and Ice Harvesting; Motor Vehicles; Land Vehicles | 1-10-56 | 7-20-55 |
| 48. (II) BERNSTEIN, S., Electricity—Conversion Systems, Protective Systems; Measuring and Testing (except Meters); Spark Plugs and Ignition Systems, Switchboards, Relays, Magnets, Inductors, Transformers, Condensers, Transistors, Barrier Layer Rectifiers | 8-12-55 | 8-18-54 |
| 49. (VII) BENDETT, B., Drying and Gas or Vapor Contact with Solids; Ventilation; Wells; Earth Boring | 9-1-55 | 3-21-55 |
| 50. (I) BENGEL, W. G., Carbon Chemistry (part), e. g. Synthetic Resin Compositions, Synthetic Rubber Compositions, Natural Rubber | 12-30-55 | 9-7-54 |
| 51. (II) YAFFEE, S., Radio Transmitters, Receivers and Tuners; Modulators; Piezoelectric Devices; Music | 12-29-55 | 8-24-54 |
| 52. (V) NEFF, P. R., Supports Joint Packing; Valved Pipe Joints or Couplings; Rod Joints or Couplings; Tool Handle Fastenings; Pipes and Tubular Conduits; Shaft Packing | 10-24-55 | 11-15-54 |
| 53. (IV) REYNOLDS, E. R., (NINAS, G. A., acting), Label Pasting and Paper Hanging; Books and Book Making; Manifolding; Printed Matter; Stationery; Paper Files and Binders; Flexible or Portable Closures or Partitions; Doors, Windows, Awnings and Shutters; Harness; Whip Apparatus | 12-2-55 | 2-30-55 |
| 54. (II) NILSON, R. G., Electric Lamps; Electronic Tubes; Miscellaneous Discharge Devices; Lamp, Cathode Ray and Gas Discharge Device Circuits; Ray Energy (e. g. X-Ray, Ultraviolet, Radioactive) Applications | 10-24-55 | 10-4-54 |
| 55. (VII) KLINE, J. R., Surgery; Dentistry; Artificial Body Members; Separating and Sorting Solids; Centrifugal Bowl Separators; Comminutors | 7-28-55 | 11-15-54 |
| 56. (I) SPECK, J. R., Abrading Compositions; Batteries; Coating or Plastic Compositions; Electrical and Wave Energy Chemistry | 12-22-55 | 9-13-55 |
| 57. (III) MILLER, A. B., Bolt, Nut, Rivet, Nail, Screw, Chain and Horseshoe Making; Driver and Screw Fastenings; Nut and Bolt Locks; Jewelry; Pipe Joints or Couplings | 3-19-56 | 2-2-55 |
| 58. (III) BRONAUGH, F. H., Rolls and Rollers; Making Metal Tools and Implements; Stone Working; Abrading Processes and Apparatus; Food Apparatus; Closure Operators; Baths, Closets, Sinks and Spittons | 10-17-55 | 11-4-54 |
| 59. (I) HENKIN, B., Inorganic Chemistry; Fertilizers; Gas, Heating and Illuminating | 9-30-55 | 1-24-55 |
| 60. (I) MANGAN, P. E., Carbon Chemistry (part), e. g., Synthetic Resins, Synthetic Rubber; Photographic Processes and Products | 8-2-55 | 9-30-54 |
| 61. (III) MORSE (Miss), E. L., Winding and Reeling; Pushing and Pulling; Horology; Time Controlling Apparatus; Railway Mail Delivery | 12-6-55 | 3-4-55 |
| 62. (IV) SHAPIRO, A., Games; Toys; Amusements and Exercising Devices; Mechanical Guns and Projectors; Illumination | 1-6-56 | 7-5-55 |
| 63. (I) WINKELSTEIN, A. H., Foods and Beverages; Carbon Chemistry (part), e. g., Lignins, Carbonhydrate Derivatives; Fats and Metal-Containing Carbocyclic or Acyclic Carbon Compounds | 11-28-55 | 12-15-54 |
| 64. (I) GREENWALD, J., Fuels; Miscellaneous Compositions | 12-27-55 | 12-20-54 |
| 66. (V) LISANN, L., Geometric Instruments; Automatic Weighing Scales; Acoustics | 10-27-55 | 6-21-54 |
| 67. (VII) KRAFFT, C. F., Laminated Fabrics; Ornamentation; Bleaching, Dyeing, Fluid Treatment of Textiles | 9-6-55 | 2-18-55 |
| 69. (II) GALVIN, D. J., Wave Guides; Electric Meters; Sound Recording; Conductors; Insulators | 11-17-55 | 6-15-54 |
| 70. (II) BREWBINK, J. L., Security laws administration. | | |
| CLASS. DIVS. I BAILEY, J. S., Paper Making; Mineral Oils | 9-14-55 | 6-8-55 |
| CLASS. DIVS. II LADY, J. E., Oscillators; Amplifiers; Resistances and Rheostats | 1-16-56 | 10-14-55 |
| CLASS. DIVS. III WAHL, R. A., Cutting and Punching; Apparel (part), e. g., Corsets and Brassieres | 1-9-56 | 7-5-55 |
| CLASS. DIVS. IV SMITH (Mrs.), M. P., Harrows and Diggers; Plows; Fluid Sprinkling, Spraying and Diffusing | 12-2-55 | 2-14-55 |
| CLASS. DIVS. V ANGLE, C. D., Liquid Separation or Purification; Sewerage | 2-6-56 | 3-1-56 |
| DESIGNS (III) A—MONCURE, J. A. (acting), Industrial Arts | 2-27-56 | 2-27-56 |
| DESIGNS (III) B—GRAY, M. A., Household, Personal and Fine Arts | 2-2-56 | 2-13-56 |

The following divisions have been abolished: 65 and 68

## EXPIRATION OF PATENTS

The patents within the range of numbers indicated below expire during November 1956, except those which may have been extended under the provisions of the Veterans Patent Extension Act (64 Stat. 316 as amended by 66 Stat. 321) and those which may have expired earlier due to shortened terms under the provisions of Public Law 690. A list of Veterans' patents which have been extended appears in the *Annual Index of Patents—1953*.

Patents ..... Numbers 2,178,536 to 2,181,857, inclusive
Plant Patent ..... Numbers 346 to 348, inclusive

# DECISIONS IN PATENT AND TRADEMARK CASES

## United States Court of Appeals Third Circuit

### R. M. PALMER COMPANY *v.* LUDEN'S INC.

*No. 11,652. Decided August 22, 1956*

[— F.2d — ; — USPQ —]

1. PATENTABILITY—STANDARDS—NEW PATENT ACT OF 1952.

"It is, perhaps, rather strong language to say that the new Act changed the law of patentability. The choice of language in the Act indicates, as the legislative history discloses, an attempt to state what the law has been. As such, it is a codification. The difficulty always existed in the application of the law, because to a large extent the standards have been indefinite and subjective. And judicial attempts to improvise expressions covering that which had been said many times before account for numerous descriptive phrasings of an elusive concept. The Act was intended to achieve the objective of stabilising the law through legislative expression which becomes the touchstone of the decisions."

2. SAME—SAME—SAME.

"Nor is it likely that a constitutional problem will arise so long as the expected interpretations of the statute come within the boundaries of long standing judicial declarations of the content of patentability. To what extent a change is wrought would seem to depend upon the preexisting views of a tribunal as to the standard upon which it has determined patentability."

3. SAME—SAME—INCREASED FACILITY OF PATENT GRANTS.

*Held* that "despite adherence to the Keystone cases, like *Hotchkiss v. Greenwood*, 11 How. 248, intangible elements have directed judicial attitudes to 'misgiving about the increased facility with which patents were being granted'."

4. SAME—SAME—NEW PATENT ACT OF 1952.

"The Act reaffirms the presumptive validity of patents (35 U. S. C., 1952 ed., Section 282), and specifies patentability in terms with which all in the field are familiar. It would appear that in this context, and by this choice of terms, the intended stabilizing effect is sought to be achieved. Beyond this, the tribunal faced with an issue of validity is left to the struggle to determine upon which side of a vague boundary line it will place the alleged invention. * * *. There is no longer any doubt that the 'flash of genius' has been laid to rest."

5. DESIGNS—PATENTABILITY—REQUIREMENTS UNDER NEW ACT OF 1952.

"The specifications for the granting of a design patent, as set forth in the Act are invention of a new, original and ornamental design non-obvious to a person of ordinary skill in the art."

6. SAME—INVENTION.

*Held* that in determining the validity of a design patent "it is almost unavoidable that the visual sense is the primary testing ground, and that the design must be looked at as a whole."

7. ATTORNEY FEES—TO PREVAILING PARTY IN EXCEPTIONAL CASES UNDER 35 U. S. C. 285.

"The 1952 Patent Act, in Section 285, continues the discretionary power of the District Court to award reasonable counsel fees in exceptional cases. The phrase 'exceptional circumstance' is not contained in the prior law (35 U. S. C. 1946 ed., Sec. 70), but confirms to the interpretation of the prior law by the cases. It is clear that counsel fees should not be awarded as a matter of course, nor as a penalty against the loser who followed conventional procedure."

8. SAME—SAME—BOTTOMED UPON FINDING OF UNFAIRNESS OR BAD FAITH.

"The exercise of discretion in favor of the allowance should be 'bottomed upon a finding of unfairness or bad faith in the conduct of the losing party, or some other equitable consideration of similar force, which makes it grossly unjust that the winner of the particular law suit be left to bear the burden of his own counsel fees which prevailing litigants normally bear'."

9. SAME—SAME—WHERE PLAINTIFF'S DESIGNS COPIED.

*Held* that a defendant's copying of the plaintiff's designs because of their success is remedied by the award of damages for infringement and does not bring the case within the reasons for awarding reasonable attorney fees to the prevailing party in exceptional cases.

10. PARTICULAR PATENTS—PALMER DESIGN PATENTS NOS. 157,621, 161,521, 161,522, 161,865—VALIDITY.

The decree of the District Court holding valid Palmer Design Patents Nos. 157,621, 161,521, 161,522, and 161,865, for various chocolate animals, affirmed.

ON APPEAL from the United States District Court for the Eastern District of Pennsylvania.

AFFIRMED.

*Henry N. Paul, Jr.*, (for R. M. Palmer Company). *Kennard N. Ware* and *Howson & Howson* (for Luden's Inc.).

Before BIGGS, *Chief Judge*, MARIS, GOODRICH, MCLAUGHLIN, KALODNER, STANLEY and HASTIE, *Circuit Judges*

KALODNER, *Circuit Judge*:

The R. M. Palmer Company, a Pennsylvania corporation, brought this action against Luden's Inc., also a Pennsylvania corporation, charging infringement of four design patents covering chocolate novelties in the form of a rabbit, a duck, a squirrel and a lamb,[1] and further charging unfair competition. The defendant denied infringement and unfair competition, and attacked the validity of the design patents. The District Court found the patents valid and infringed, and allowed the recovery of counsel fees, but found against the plaintiff on its charge of unfair competition. 128 F. Supp. 672 (E. D. Pa. 1955). The defendant prosecuted this appeal.

The defendant does not here assert non-infringement, but contends that the District Court erred in sustaining the validity of the four design patents involved and in awarding counsel fees to the plaintiff. The questions are thus confined. It should be noted, too, that on the issue of validity, the defendant relies upon the failure of the designs to evince invention over the prior art, rather than upon anticipation.

The facts are not substantially in dispute. As found by the District Court, they are as follows:

Richard M. Palmer, the patentee and assignor of the plaintiff, started in the candy business on a small scale in 1948, in Reading, Pennsylvania, where the defendant, a large and well-established candy manufacturer has its offices and plant. Prior to 1948, hollow chocolate standard or conventional figures were produced by the defendant, principally from imported German molds known as "Reiche" molds, so-called after the manufacturer. These molds, of animals, were "realistic" in concept, following natural proportions and postures. Because of the war, with limitations on uses of chocolate and impossibility of importation, the industry, at least insofar as we are concerned, endured nonproduction, at least until

[1] Design Patent No. 157,621, March 7, 1950, consisting of a chocolate rabbit; Design Patent No. 161,521, January 2, 1951, consisting of a chocolate duck; Design Patent No. 161,522, January 2, 1951, consisting of a chocolate lamb; Design Patent No. 161,865, February 6, 1951, consisting of a chocolate squirrel.

some time in 1946. After 1946, the former distributor of "Reiche" molds, commenced to manufacture its own molds continuing a selected number of the more popular "Reiche" figures. It is clear that the hollow chocolate candy art was, at the time Palmer entered it, "old-fashioned," "stagnant" and "lagging," to use the defendant's terms.

The figures developed by Palmer are fanciful, decorated productions of the animals involved, cast in hollow chocolate, with exaggerated features. They might be described as ornamented caricatures. The record suggests difficulty of design attributable to the frailty of the medium and to the manufacturing technique. In the Easter season, which is the trade objective of this kind of product, Palmer's figures met with "marked success,"[2] again using the defendant's term. It was for this reason that the defendant included the items in its line of confections.

Unquestionably, Palmer awakened the industry to a new satisfaction of a long felt need. The defendant, whose counsel have demonstrated laudable candor, does not seek to detract from what it calls the good judgment, ability and acumen of Palmer. Nor does it seek to detract from fancifulness, attractiveness and appeal of the designs. Nevertheless, it maintains that there is not such novelty as warrants patent protection, and that the designs evidence only the expected skill of a good craftsman, which does not rise to the dignity of invention.

The District Court found that the designs were new and different; that they were non-obvious at the time they were made; that they were the result of inventive faculty, exhibiting a designing skill beyond the ordinary skill of the art.

The plaintiff came to the District Court with the benefit of the presumption of validity. The defendant did not rely upon prior patents different from those considered by the Patent Office. The defendant comes to this Court with the burden of convincing us that the District Court's findings, to the extent they are findings of fact, are clearly erroneous. *United States v. U. S. Gypsum Co.*, 333 U. S. 364, 395 (1948).

It is our opinion that the judgment of the District Court ought not to be set aside.

In the field of judicial testing of the validity of patents, it is a common observation that the law is settled, the difficulty existing in its application. Here, the plaintiff has introduced an argument as to the effect of the Patent Act of 1952, 35 U. S. C., 1952 ed., Section 1, et seq. The argument presupposes that the courts, as a result of the "flash of genius" expression in *Cuno Engineering Corp. v. Automatic Devices Corp.*, 314 U. S. 84, 91 (1941), have applied a higher, more rigid standard for determining validity, and that the recent Act, 35 U. S. C., 1952 ed. Section 103,[3] constitutes a congressional change of direction to assertedly more lenient criteria. Notwithstanding that the plaintiff rests upon the conclusion of the District Court that the design patents involved meet the requirements of the new Act, the issue raised merits attention.[4]

The provisions of Section 103, 35 U. S. C., 1952 ed., as set forth in footnote 3, are new. The purpose of the provisions as stated by the Reviser is to achieve a stabilizing effect, and to render immaterial whether the invention resulted from "flash of genius."[5]

[1] It is, perhaps, rather strong language to say that the new Act changed the law of patentability. The choice of language in the Act indicates, as the legislative history discloses, an attempt to state what the law has been. As such, it is a codification. The difficulty always existed in the application of the law, because to a large extent the standards have been indefinite and subjective. And judicial attempts to improvise expressions covering that which had been said many times before account for numerous descriptive phrasings of an elusive concept. The Act was intended to achieve the objective of stabilizing the law through legislative expression which becomes the touchstone of the decisions. [2] Nor is it likely that a constitutional problem will arise so long as the expected interpretations of the statute come within the boundaries of long standing judicial declarations of the content of patentability. To what extent a change is wrought would seem to depend upon the preexisting views of a tribunal as to the standard upon which it has determined patentability.[6] [3] As pointed out by Judge Learned Hand in *Lyon v. Bausch & Lomb Optical Co.*, 224 F.2d 530, 535–536 (2nd Cir. 1955), cert. den. 350 U. S. 911, despite adherence to the keystone cases, like *Hotchkiss v. Greenwood*, 11 How. 248, intangible elements have directed judicial attitudes to "misgiving about the increased facility with which patents were being granted."

We are inclined to accept the sensitive observations of Judge Learned Hand as to the judicial tendency of recent years, even within the language of the older decisions, to expect an indefinite "more" of the proffered invention. [4] The Act reaffirms the presumptive validity of patents (35 U. S. C., 1952 ed., Section 282), and specifies patentability in terms with which all in the field are familiar. It would appear that in this context, and by this choice of terms, the intended stabilizing effect is sought to be achieved. Beyond this, the tribunal faced with an issue of validity is left to the struggle to determine upon which side of a vague boundary line it will place the alleged invention. E. g. *Jungerson v. Ostby & Barton Co.*, 335 U. S. 560 (1949), and dissenting opinions at 568 and 571. There is no longer any doubt that the "flash of genius" has been laid to rest.

[5] The specifications for the granting of a design patent, as set forth in the Act are invention of a new, original and ornamental design non-obvious to a person of ordinary skill in the art. In *Gorham v. White*, 14 Wall. 511, 525 (1872), an infringement case, the Supreme Court emphasized that

> "it is the appearance itself . . . that constitutes mainly, if not entirely, the contribution to the public which the law deems worthy of recompense. The appearance may be the result of peculiarity of configuration or of ornament alone, or of both co-jointly, but in whatever way it is produced, it is the new thing or product which the patent law regards."

And in *Glen Raven Knitting Mills v. Sanson Hosiery Mills*, 189 F.2d 845, 850–852 (4th Cir. 1951), the law was fairly summarized:

> "Later cases developed the standards to be used when the validity of a design patent was at issue. Validity is to be tested by the appearance of the patented design as a whole. *Dobson v. Dornan*, 118 U. S. 10, 15. 6 S. Ct. 946, 30 L. Ed. 63. 'A combination of elements that are old is patentable. If it produces a new and useful result as the product of the combination; and a design which avails itself of suggestions old in art is patentable, if as a whole, it produces a new and pleasing impression on the aesthetic sense.' *Matthews & Willard Mfg. Co. v. American Lamp & Brass Co.*, 3 Cir., 103 F. 634, 639. Nevertheless, there must be an exercise of the inventive faculty, and if the design lacks this quality, it will not suffice to say that it is new, original and ornamental, and has received wide public acceptance. *Smith v. Whitman Saddle Co.*, 148 U. S. 674, 13 S. Ct. 768, 37 L. Ed. 606; *S. Dresner & Son v. Doppelt*, 7 Cir., 120 F.2d 50; . . . 'In short, the test is whether the design involved "a step beyond the prior art requiring what is termed 'inventive genius'". *General Time Instrument Corp. v. U. S. Time Corp.*, 2 Cir., 165 F.2d 853, 854."

The Court further indicated, at page 853, the special importance of commercial success in determining the validity of the design patent. See *Sanson Hosiery Mills, Inc. v. Warren Knitting Mills, Inc.*, 202 F.2d 395, 396 (3rd Cir. 1953); *J. R. Wood & Sons, Inc. v. Abelson's, Inc.*, 74 F.2d 895 (3rd Cir. 1934).

[6] It is almost unavoidable that the visual sense is the primary testing ground, and that the design must be looked at as a whole. We are of the opinion that the designs in this instance disclose artistic treatment in form and configuration, creating a pleasing impression and substantially different aesthetic effect. We are of the opinion, further, that they reflect originality born of inventive faculty. While the defendant offered numerous publications showing a variety of novelty designs, none meet the visual test, to detract from the impressions left by Palmer's designs. What the defendant sought to show was the state of the art, but the difficulty lies in the fact that while arms, legs, and various other parts of the body and ornamentations are necessary parts of the Palmer configurations, it is the whole upon which decision must be based. The defendant insists that the "Walt Disney" forms make Palmer's designs nothing other than the work of a skillful craftsman. In essence, however, the defendant's argument is that the idea of the "Walt Disney" type of product is old, so that any figure or design is merely a variation which does not involve invention. Reliance is placed upon *Knickerbocker Plastic Co. v. Allied Molding Corp.*, 184 F.2d 652 (2d Cir. 1950). But the Court there did not hold that the design involved was unpatentable merely because it was within the field of unnatural, grotesque figures. Rather, it concluded that the features of the design in dispute were "pretty substantially duplicated in one or more of the four Disney ducks. Even if they were not, the Disney product had so popularized the not too unusual idea of a grotesque animal design for this particular fowl that more than this type of change would appear to be needed to show invention." It is apparent that the Court did not consider the whole field of exaggerated animal figures to have been preempted by the idea alone, and that the design in dispute failed of patentability because it did not get out from Disney's shadow, as the Court put it.

We conclude, therefore, that the District Court did not err in holding Palmer's design patents valid. There is no question that they were infringed.

Finally, the defendant disputes the correctness of awarding counsel fees to the plaintiff. [7] The 1952 Patent Act, in Section 285,[7] continues the discretionary power of the District Court to award reasonable counsel fees in exceptional cases. The phrase "exceptional circumstance" is not contained in the prior law (35 U. S. C., 1946 ed., Sec. 70), but confirms to the interpretation of the prior law by the cases. It is clear that counsel fees should not be awarded as a matter of course, nor as a penalty against the loser who followed conventional procedure. *Jacquard*

---

[2] In the Easter season of 1949, plaintiff sold 18,233 dozens of the rabbit and 138,280 dozens in 1953; in 1950, it sold 13,000 dozens of the duck, and 29,000 in 1953; in 1951, it sold 14,000 dozens of the lamb and 35,000 dozens of the squirrel, and 36,000 dozens of the lamb and 58,000 dozens of the squirrel in 1953.

[3] Section 103, 35 U. S. C., 1952 ed. is made applicable to design patents by virtue of Section 171, which reads as follows:

"Section 171. Patents for designs.

"Whoever invents any new, original and ornamental design for an article of manufacture may obtain a patent therefor, subject to the conditions and requirements of this title.

"The provisions of this title relating to patents for inventions shall apply to patents for designs, except as otherwise provided."

This is based upon 35 U. S. C., 1946 ed., Section 73. The law was, and is, that invention is as necessary in design patents as in utility patents. *Smith v. Whitman*, 148 U. S. 674 (1893); *S. Dresner & Sons, Inc. v. Doppelt*, 120 F.2d 50, 52 (7th Cir. 1941).

Section 103, 35 U. S. C., 1952 ed., reads as follows:

"Section 103. Conditions for patentability; non-obvious subject matter.

"A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made."

[4] *Wassermen v. Burgess & Blacker Co.*, 217 F.2d 402, 404 (1st Cir. 1954); *Lyon v. Bausch & Lomb Optical Co.*, 224 F.2d 530, 535–536 (2nd Cir. 1955), cert. den. 350 U. S. 911; *Interstate Rubber Products Corp. v. Radiator Specialty Co., Inc.*, 214 F.2d 546, 549 (4th Cir. 1954); *Vincent v. Sun-Citrus Products Co.*, 215 F.2d 305, 315 (5th Cir. 1954); *General Motors Corp. v. Estate Stove Co.*, 203 F.2d 912, 915 (6th Cir. 1953); *Helms Products, Inc. v. Lake Shore Manufacturing Co.*, 227 F.2d 677, 682–683 (7th Cir. 1955); *Pacific Contact Laboratories, Inc. v. Soles Laboratories, Inc.*, 209 F.2d 529, 533 (9th Cir. 1953); *L-O-F Glass Fibers Co. v. Watson*, 228 F.2d 40, 47 (D. C. Cir. 1955); and also our own references to the new Act: *Stanley Works v. Rockwell Mfg. Co.*, 203 F.2d 846, 849 (1953); *Mojonnier Bros. Co., Inc. v. Tolen Machinery Co., Inc.*, 230 F.2d 850, 851 (1956); see also, *Gagnier Fibre Products Co. v. Fourslides, Inc.*, 112 F. Supp. 926 (E. D. Mich. 1953); *Thye Co. v. Oeste*, 111 F. Supp. 665, 673, 674 (N. D. Calif. 1953), aff'd per curiam, 219 F.2d 131 (9th Cir. 1955).

[5] "There is no provision corresponding to the first sentence explicitly stated in the present statutes, but the refusal of patents by the Patent Office, and the holding of patents invalid by the courts, on the ground of lack of invention or lack of patentable novelty has been followed since at least as early as 1850. This paragraph is added with the view that an explicit statement in the statute may have some stabilizing effect, and also to serve as a basis for the addition at a later time of some criteria which may be worked out.

"The second sentence states that patentability as to this requirement is not to be negatived by the manner in which the invention was made, that is, it is immaterial whether it resulted from long toil and experimentation or from a flash of genius."

See also, House Report No. 1923 (May 12, 1952) and Senate Report No. 1979, June 27, 1952 (both 82d Cong. 2d Sess.):

"Section 103, for the first time in our statute, provides a condition which exists in the law and has existed for more than 100 years, but only by reason of decisions of the courts. An invention which has been made, and which is new in the sense that the same thing has not been made before, may still not be patentable if the difference between the new thing and what was known before is not considered sufficiently great to warrant a patent. That has been expressed in a large variety of ways in decisions of the courts and in writing. Section 103 states this requirement in the title. It refers to the difference between the subject matter sought to be patented and the prior art, meaning what was known before as described in Section 102. If this difference is such that the subject matter as a whole would have been obvious at the time to a person skilled in the art, then the subject matter cannot be patented.

"That provision paraphrases language which has often been used in decisions of the courts, and the section is added to the statute for uniformity and definiteness. This section should have a stabilising effect and minimise great departures which have appeared in some cases."

[6] See *Anderson Co. v. Lion Products Co.*, 127 F.2d 454, 457 (1st Cir. 1942); *Bellevance v. Frank Morrow Co.*, 140 F.2d 419, 423 (1st Cir. 1944); *Brown & Sharpe Mfg. Co. v. Ker Engineering Co.*, 154 F.2d 48, 51 (1st Cir. 1946); *Weidhaas v. Loew's, Inc.*, 125 F.2d 544, 545 (2d Cir. 1942); *Fosboro Co. v. Taylor Instrument Co.*, 157 F.2d 226, 234 (2d Cir. 1946); *Robertson Rock Bit Co. v. Hughes Tool Co.*, 176 F.2d 785, 790 (5th Cir. 1949); *Trubon Engineering Corp. v. Dirkes*, 186 F.2d 24, 27 (6th Cir. 1943); *Feilchenberg v. Bernard Edward Co.*, 175 F.2d 427, 428–429 (7th Cir. 1949); *Alemite Co. v. Jiffy Lubricator Co.*, 176 F.2d 444, 448–449 (8th Cir. 1949); *Trico Products Corp. v. Dolman Corp.*, 180 F.2d 529, 533–534 (8th Cir. 1950), and compare with the decisions cited in footnote 4, supra.

[7] "Sec. 285. Attorneys fees. The Court in exceptional cases may award reasonable attorney fees to the prevailing party."

*Knitting Mach. Co.* v. *Ordnance Gauge Co.*, 213 F.2d 508, 508–509 (3rd Cir. 1954); *Pennsylvania Crusher Co.* v. *Bethlehem Steel Co.*, 193 F.2d 445, 450–451 (3rd Cir. 1951); *Park-in-Theatres* v. *Perkins*, 190 F.2d 137, 142–143 (9th Cir. 1951); *Dubil* v. *Rayford Camp & Co.*, 184 F.2d 899, 902–903 (9th Cir. 1950). [8] The exercise of discretion in favor of the allowance should be "bottomed upon a finding of unfairness or bad faith in the conduct of the losing party, or some other equitable consideration of similar force, which makes it grossly unjust that the winner of the particular law suit be left to bear the burden of his own counsel fees which prevailing litigants normally bear." *Park-in-Theatres* v. *Perkins*, supra, at page 142.

[9] Here, as in *Pennsylvania Crusher Co.* v. *Bethlehem Steel Co.*, supra, there is no finding of the District Court which would bring the case within the reasons for granting the award. The District Court did find, generally, that the defendant copied the plaintiff's designs because of their success. But it appears to us that this is remedied by the award of damages for infringement. Otherwise, nothing gives support to any equitable consideration for the allowance of counsel fees, and plaintiff makes no claim.

[10] For the reasons stated, the judgment of the District Court will be affirmed, except insofar as it allows counsel fees to the plaintiff.

AFFIRMED.

---

HASTIE, *Circuit Judge* (dissenting):

I think the district court's finding of invention in this case was clearly erroneous. We all agree that, in the language of the majority opinion, "the granting of a design patent . . . [must be based upon] invention of a new, original and ornamental design nonobvious to a person of ordinary skill in the art." My disagreement is based upon the belief that plaintiff's design cannot be reasonably said to meet that standard. The Disney figures and many other prior art caricatures of rabbits, ducks, squirrels and lambs were before the district court and are before us. In one or two cases plaintiff's design approximates earlier figures almost as closely as would a copy. All of plaintiff's designs are so similar to earlier caricatures as to suggest that what plaintiff has done would necessarily be obvious to any draftsman familiar with recent developments in that field; and the record contains no testimony, expert or otherwise, to indicate any distinctive characteristics differentiating plaintiff's designs significantly from other familiar caricatures of the same animals.

In this view of the matter I cannot see how plaintiff's figures can reasonably be said to exhibit inventive variation from what was already familiar. It seems to me—and I think plaintiff's testimony is to the same effect—that what plaintiff contributed here was a very good merchandising idea, namely, that caricatures of animals such as had proved attractive in other fields would also make edible chocolate animals sell better. But the reduction of that idea to practice was not invention.

I would reverse the judgment.

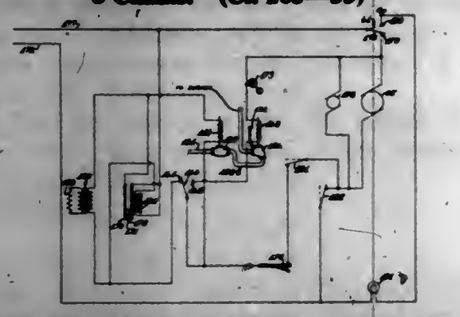
**Re. 22,055** (of **2,227,815**), P. M. G. Toulon, Synchronization system for television; **2,208,874**, H. M. Lewis, Television receiving system, filed Oct. 17, 1951, D. C., N. D. Ill. (Chicago), Doc. 51c1640, *Haseltine Research, Inc.* v. *Avco Mfg. Corp. et al.* Mandate of C. C. A.: judgment of District Court affirmed Mar. 19, 1956: Claims 5, 6, 7, 9, 10, and 13 of Re. 22,055 held valid and infringed; injunction against infringement waived by plaintiff; defendants' first and second counterclaims dismissed Oct. 1, 1956.

**Re. 23,843** (of **2,589,900**), R. J. Oace et al., Insulating tape, filed Aug. 3, 1954, D. C., M. D. N. C. (Greensboro), Doc. 879–G, *Minnesota Mining & Mfg. Co.* v. *Pine State Electric Supply Co.* Judgment favor plaintiff June 12, 1956. Same, Doc. 878–G, *Minnesota Mining & Mfg. Co.* v. *Sears, Roebuck and Co.* Decree as above. Same, appeal filed Sept. 13, 1956, C. C. A., 4th Cir., Doc. 7298, *Sears, Roebuck and Co. et al.* v. *Minnesota Mining & Mfg. Co.*

**Re. 24,125.** (See 2,333,087.)

# REISSUES

## NOVEMBER 6, 1956



Matter enclosed in heavy brackets [ ] appears in the original patent but forms no part of this reissue specification; matter printed in italics indicates additions made by reissue.

### 24,235
### CLOTHES DRIER AND ELECTRICAL CONTROL THEREOF

Peter Edward Goldhof and Harold E. Morrison, Benton Harbor, Mich., assignors, by mesne assignments, to Whirlpool-Seeger Corporation, St. Joseph, Mich., a corporation of Delaware

Original No. 2,678,814, dated May 18, 1954, Serial No. 288,708, January 31, 1951, which is a division of Serial No. 123,018, October 22, 1949. Application for reissue May 17, 1956, Serial No. 585,596

8 Claims. (Cl. 263—33)

2. A clothes drier comprising a cabinet, a rotatable drum within said cabinet, said cabinet having a door opposite one end of said drum, an electric motor connected to drive said drum, electrically controlled heating means, *means* operated by said motor [, means] for circulating heated air through said drum, a door switch movable to a closed position by closure of said door, a timer having two switches closing at different time intervals, said electrically controlled heating means being energized through said second switch and said motor being energized through said door switch through said first switch, said first switch closing prior to said second switch, and said switches opening in a reverse order, whereby said motor and drum continue to rotate after the heat is turned off.

### 24,236
### OIL WELL TESTING TOOL

Sterling P. Bedingfield, Bossier City, La.

Original No. 2,736,383, dated February 28, 1956, Serial No. 218,593, March 31, 1951. Application for reissue June 25, 1956, Serial No. 593,784

9 Claims. (Cl. 166—188)

1. An oil well testing tool comprising a series of threadably joined tubular sleeves, a hollow mandrel having the upper end thereof arranged for threaded attachment to a string of drill pipe or the like, a portion of the lower end of said mandrel being enclosed in the upper end of said joined tubular sleeves, said mandrel being further provided with locking means between the same and the side walls of the sleeve enclosing it, said mandrel being unlocked from said sleeve by lowering the pipe string to which said mandrel is attached to permit both longitudinal and rotative movements of said mandrel independently of said joined tubular sleeves, a

valve for stopping fluid flow upwardly through said tubular sleeves, said valve including a valve stem connectable with said mandrel and movable longitudinally therewith, an annular valve seat formed on an end of one of said sleeves, means for locking said valve stem against rotative movement relative to said sleeves but permitting longitudinal movement thereof with the mandrel to which the same is attached, and means for closing said valve against said valve seat operable upon rotating said mandrel when the same is in an unlocked position to disconnect it from the valve stem.

# PLANT PATENTS

## GRANTED NOVEMBER 6, 1956

Owing to the fact that almost all of the illustrations of the plant patents are in colors, it is not practicable to print a cut of the drawing.

### 1,526
### ALMOND TREE

Leslie M. Thompson, Clovis, Calif.

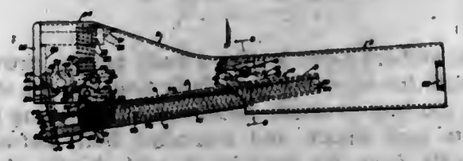
Application June 6, 1955, Serial No. 513,623

1 Claim. (Cl. 47—62)

A new and distinct variety of almond tree, substantially as described and illustrated, characterized particularly as to novelty by its late blooming so as to avoid damage by late frost, its blooming period being substantially later than that of the Texas and Nonpareil, by its general similarity to the Nonpareil in tree appearance and growing habits, and by its markedly heavier more regular bearing than the Texas and Nonpareil.

# PATENTS

## GRANTED NOVEMBER 6, 1956



# GENERAL AND MECHANICAL

### 2,769,173
### STAPLE MAGAZINE AND FEED MEANS FOR STAPLING MACHINES

Charles M. Lindstrom, Westerly, R. I., assignor to Bostitch, Inc., Stonington, Conn., a corporation of Rhode Island

Application May 27, 1955, Serial No. 511,650

12 Claims. (Cl. 1—49)

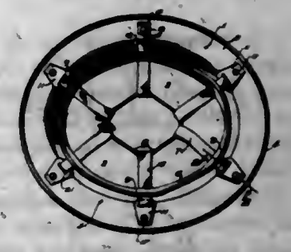
1. In a fastener-applying implement, a supporting member, a magazine for fasteners hinged to said member to pivot relatively thereto, said magazine having an opening in its side for loading fasteners thereinto, a cover having means for slidably mounting it on said magazine for opening and closing said opening in its side, a staple-core extending longitudinally within said cover and fast therewith, means for advancing the fasteners on said core to feed them forwardly in the magazine, a latch, means at the forward end of the magazine for pivotally mounting said latch thereon, detent-means on said cover engageable by said latch for retaining the cover in position to close the opening in the magazine, and resilient means for controlling said latch to hold it in engagement with said detent-means, said resilient means also acting between the supporting member and latch to swing the forward end of said magazine downwardly relatively to said member.

### 2,769,174
### TACKING MACHINE

Norris R. Libert, Waterford, Wis.

Application June 25, 1954, Serial No. 439,257

10 Claims. (Cl. 1—49)



1. In a tacking machine the combination comprising a frame with a head end and a pivot mounting for an operating handle remote from the head end, a reciprocable staple ejecting driver carried by said head end movable toward the bottom of said frame in a staple ejecting stroke, a spring abutment attached to the frame, a main spring captively held between said driver and spring abutment adapted to urge said driver in a staple ejecting stroke, an operating handle pivotally mounted on said pivot mounting of said frame with a manually engageable portion above said frame extending from the pivot mounting toward said head end, and an operating linkage interposed between said handle and said reciprocable driver to move said driver against said spring to compress the same upon pivoting said handle downwardly toward the bottom of said frame, which linkage includes latch and catch members disengageable from one another to break the linkage one of which members is positioned to be struck by said handle upon completion of a downward movement of said handle to release said spring for moving said driver in a staple ejecting stroke.

### 2,769,175
### CRADLE CLIP FOR SAFETY HATS

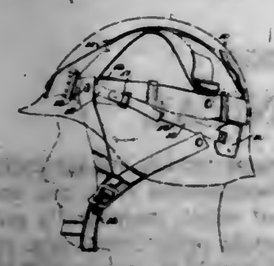
Luher Paul Berker, Jr., Pacific Palisades, Calif.

Application April 19, 1954, Serial No. 424,084

1 Claim. (Cl. 2—3)

In a safety hat having a crown flaring outwardly to form a rim, a ring of attachment elements secured to and depending from said rim, said elements including stem portions terminating in buttons spaced from said rim, and a cradle including a headband and radiating straps, a cradle clip for connecting each strap to a corresponding button, each cradle clip comprising: a plate member having a larger end and a smaller end, the side margins of said plate member being bent from the plane of said plate member to form stiffening elements, the larger end of said plate being curved in general conformity with the hat in the region of the juncture between the crown and rim, and slotted to receive the end of a radiating strap, a portion of said strap being interposed between the larger end of said plate member and said hat to form a pad spacing the larger end of the plate member from contact with the hat, the smaller end of said plate member being folded under said plate member and bifurcated to form a forked tongue straddling said stem, the normal spacing between said forked tongue and said plate member being less than the thickness of the button, whereby said button is gripped between said tongue and plate member to hold said tongue and plate spaced from said rim, said plate member having a recess therein located to receive the extremity of said button to retain said plate member thereon.

### 2,769,176
### NAPE STRAP

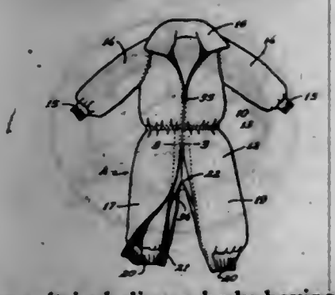


Stephen V. Granacay, Barrytown, N. Y., and Leonard Helmrich, Princeton, N. J., assignors to the United States of America as represented by the Secretary of the Army

Application September 24, 1954, Serial No. 458,297

2 Claims. (Cl. 2—3)

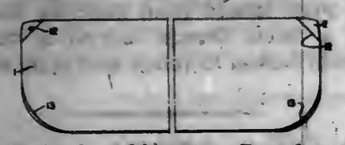
1. In a helmet, the combination with a helmet shell having a helmet suspension which includes a headband disposed in inwardly spaced relation to said shell; of a nape strap comprising two end portions, a nape-engaging center portion between said end portions, means including buckles for adjusting the length of said end portions



and connecting the same to said shell, and said means including flexible means mounting said buckles between

said headband and shell so as to be inwardly spaced from said shell.

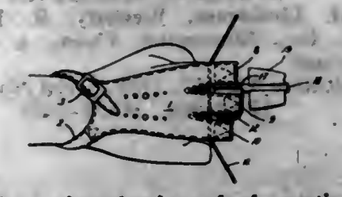
---



2,769,177
**SNOW SUIT (EASILY DETACHABLE GARMENT)**
Morris Jach Berg, St. Paul, Minn.
Application May 6, 1953, Serial No. 353,302
2 Claims. (Cl. 2—80)

1. A snow suit including a body having a blouse portion and a leg opening pants portion integrally connected together at the waist, the pants portion including a crotch portion and two leg portions joined at the crotch portion, said leg portions having openings throughout their respective length along lines adjacent to and forwardly of the said crotch portion, a pair of separable fasteners extending along the respective lengths of the openings in each leg portion, said fasteners converging at their upper ends, flaps overlying the upper ends of the separable fasteners and extending upwardly to the neck of the garment, and a third fastener connecting said flaps in overlapping relationship with the upper ends of the first named fasteners.

---



2,769,178
**METHOD OF MAKING A CUFF AND ATTACHMENT OF SAME TO A SLEEVE**
George N. Jeffcock, Cohoes, and Albert E. Wagar, Albany, N. Y., assignors to Cluett, Peabody & Co., Inc., Troy, N. Y., a corporation of New York
Application August 18, 1954, Serial No. 450,667
3 Claims. (Cl. 2—123)

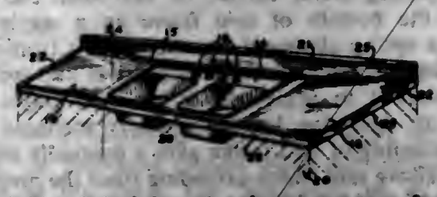
1. The method of making a cuff and attaching it to a garment sleeve, which comprises superposing two face layers and a lining layer in a stack in the order named, with the outside faces of the face layers downward, turning all marginal edges of the superposed layers together inwardly upon the lining layer, removing the lower layer from the bottom of the stack, turning it end for end, and disposing it upon the other layers in the stack, with its inner face abutting the lining layer and its marginal edges aligned with those of the other layers, then stitching together the three layers, so assembled, along the side edges and also the edge which is to be the free end edge of the cuff, to unite all of the layers in this relationship, then inserting the free end of the sleeve between the inturned marginal edges of the face layers at the unstitched end of the cuff, then stitching together said unstitched end of the cuff and the inserted sleeve end.

---

2,769,179
**ARCHERY GLOVES**
Albert J. Love, Mathis, Tex.
Application November 2, 1953, Serial No. 389,606
8 Claims. (Cl. 2—161)

1. In an archery glove having a body portion provided with a sheath for receiving the middle finger of the shooting hand, the improvement comprising a stiffening band attached to said sheath and extending both outwardly and inwardly from the portion of said sheath adapted to cover the first joint of the middle finger.

---



2,769,180
**METAL SUPPORT, MORE PARTICULARLY FOR BRASSIERES AND SIMILAR USES**
Georges Henri Tarene and Lucien Charles Wilhelm, Paris, France
Application April 20, 1954, Serial No. 424,428
Claims priority, application France September 28, 1953
1 Claim. (Cl. 2—264)

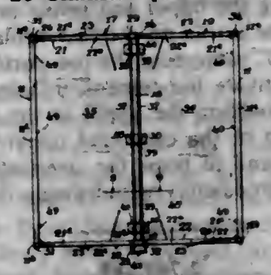
A substantially rigid arcuate brassiere frame for insertion into the two cups of a brassiere, said frame being made of a single flat metallic wire of substantially rectangular cross section and comprising two substantially semi-circular sections for extending around the bottom and both side portions of each of said cups and also comprising a spacer section interconnecting said semi-circular sections in spaced and resilient manner to allow resilient bending of said semi-circular sections in a direction toward each other while substantially rigidly supporting said semi-circular sections against bending in a direction perpendicular to said direction, the wider sides of said flat metallic wire forming the front and rear surfaces of said frame, and the narrower sides of said metallic wire of substantially rectangular cross section forming the upper and lower surfaces of said frame.

---

2,769,181
**UNITARY SINK, COUNTER TOP AND DRAINBOARD CONSTRUCTION**
George T. Miller, Pittsburgh, Pa.
Application September 17, 1954, Serial No. 456,677
7 Claims. (Cl. 4—187)

3. A sink and drainboard unitary structure for mounting upon a support comprised of a relatively rigid base having a sink opening therein, a sheet of hard flexible protective material secured to and covering the upper surface of said base, a sink bowl mounted at the opening in said base, the base having a relatively narrow flexible section extending transversely thereacross and adjacent to the edge of said opening to permit said base to be flexed upwardly to define a sloping drainboard, a front forming strip and a back splash board secured to the front and back edges respectively of said flexed base and with their upper edges projecting above the upper surface of said drainboard thereby firmly to retain the slope applied to said drainboard.

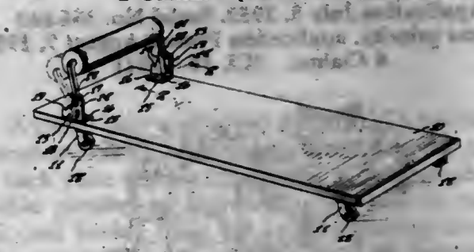
---



2,769,182
**INFLATABLE MATTRESS LIFTERS**
Erwin J. Nunliet, Mountain View, N. J.
Application April 21, 1954, Serial No. 424,672
4 Claims. (Cl. 5—68)

4. In a mattress lifting device of the character described, the combination of a first comparatively large, inflatable cylindrical container of a length substantially corresponding to the width of the mattress, a second comparatively small inflatable cylindrical container substantially corresponding in length to said first container, a plurality of straps connecting said first and second containers, a belt secured to the underside of each of said straps for adjustably securing said containers to a support under said mattress, a generally rectangular-shaped mattress lifting frame pivoted at one end to said belt between said containers for pivotal movement about an axis extending transversely of said mattress, the upper side of said frame supporting said mattress and the lower side of said frame resting on said first container, said frame being of a width not exceeding the width of said mattress, and means for controllably inflating and deflating said cylinders, whereby said frame and said second container are adapted to independently raise different portions of said mattress when said containers are inflated and to independently lower different portions of said mattress when said containers are deflated.

---



2,769,183
**INFANT'S FOLDING UTILITY STRUCTURE**
George E. Froelich, Two Rivers, Wis., assignor, by mesne assignments, to Henry J. Landry, Ashburnham, Mass.
Application May 18, 1953, Serial No. 355,673
10 Claims. (Cl. 5—99)

1. In an infant's folding utility structure of the class described embodying two end members and corner posts at each end of each end member, in combination, a center beam between and parallel with the end members, a center post fixed to and at each end of the center beam, collapsible side parts between said center posts and each of said end members respectively, a floor section between said center beam and each of said end members hinged to said center beam, whereby said floor sections may be folded upwardly toward each other between the end members when the end members are brought toward each other upon collapse of the side parts, and a foot pedal pivoted on one of said center posts and having a lever arm under each of said floor sections whereby when the pedal is pressed downwardly the floor sections are pivoted upwardly about the center beam, all of said posts extending below the floor sections to support the structure.

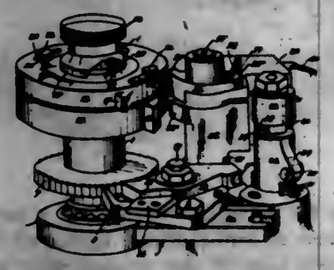
---

2,769,184
**CREEPER HEADREST**
Victor Collica, Bronx, N. Y.
Application August 17, 1953, Serial No. 374,731
1 Claim. (Cl. 5—327)

A head rest for creepers comprising a pair of adjustable first brackets of substantially L-shaped cross section mounted at each side of the creeper near one end, the vertical portions of said first brackets along the upper edge being provided with a plurality of notches, said vertical portions below said notches being provided with a vertical elongated slot, a substantially U-shaped bar having the ends adapted to fit between the vertical portions of said first brackets, a padded head rest mounted on the central portion of said bar and means for mounting a pair of vertically spaced pins at the end of said bar on the side thereof adjacent the inner faces of the vertical portions of said first brackets, the uppermost of each of said pair of pins being adapted to rest in one of said notches, while the lowermost of said pins rests in the bottom of said vertical slot, the said U-shaped bar being of substantially square cross section, and a pair of second brackets of substantially U-shaped cross section, each of which being adapted to straddle one end of the said U-shaped bar with the central portions of the said second brackets adjacent the inner faces of the said vertical portions, means at one side of the said second brackets for securing the same to the ends of the said bar, the central portions of the said second brackets having a pair of vertically spaced openings and the said pins being located within the said openings and having enlarged heads, disposed intermediate the said bar and the central portion of the said second brackets.

---

2,769,185
**MUSCULAR SUPPORT**
William F. Biedermann, Philadelphia, Pa.
Application May 11, 1953, Serial No. 354,249
2 Claims. (Cl. 5—338)

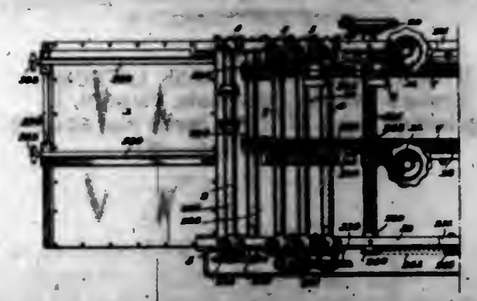


1. A rigid muscular support having a base, a relatively wide and high dome at one end, a relatively narrow ridge extending longitudinally in the middle and a nose portion descending in a curve rearwardly and at the two sides, the dome comprising a mid-portion which extends abruptly upwardly at the end remote from the nose portion, the mid-portion then rising gradually from the front in two saddles and the mid-portion having a depressed por-

tion in between the saddles, and the dome sloping off abruptly transversely at the sides on both sides of the saddles in convex curves, the ridge portion being convexly curved at the top, lower than the dome and descending on both sides in concave curve portions, the ridge portions rising at the sides to the nose portion.

---

2,769,186
**CONTROL MEANS FOR CUTTING A THREAD IN PLURAL SUCCESSIVE PASSES**
Pierre Edouard Renaux, Argenteuil, France, assignor to Societe Anonyme dite: Cri-Dan, Paris, France, a French company
Application July 8, 1953, Serial No. 366,663
Claims priority, application France August 7, 1952
6 Claims. (Cl. 10—101)



1. In a thread-cutting machine for machining a piece of work, including a tool holder, a cam controlling the transverse movements of the tool holder and a ratchet system controlling the rotation of the cam, the provision of a control mechanism comprising two coaxial superposed plates, a spindle carrying said plates, and controlled by the ratchet system, a first projection rigid with the first plate, an auxiliary spindle, a first lever pivotally mounted on said auxiliary spindle, a spring urging said lever into a predetermined angular setting, said lever being urged away from said setting when engaged by the first projection at a point of the travel of the latter, a second lever pivotally mounted on the same auxiliary spindle and the angular movements of which between inoperative and operative positions are controlled by those of the first lever, a control spindle controlling a function of the machine whereby the tool may be modified, a first member rigid with said control spindle and normally engaged by the second lever, a disconnecting spring urging said first member and control spindle into their operative positions upon release of the first member by the second lever after the first projection has shifted the first lever, a second projection carried by the second plate, angularly shifted with reference to the first projection and also adapted to act at a point of its travel on the first lever in opposition with the corresponding spring, a third lever pivotally mounted on the auxiliary spindle and controlled by the second projection, a spring urging the third lever into its operative position, the second projection being adapted to urge the third lever away from its operative position against the action of the spring, a second member revolubly carried by the control spindle and normally held fast by the third lever when in its operative position, a spring urging said second member into its operative position when released by the third lever, and means whereby the second member, when in its operative position, controls the ratchet system to return same into its starting position.

---

2,769,187
**APPARATUS FOR MANUFACTURING BOOK CASES OR COVERS**
Franciscus Pieter D'Huy, Overveen, Netherlands
Application April 26, 1951, Serial No. 222,965
7 Claims. (Cl. 11—2)

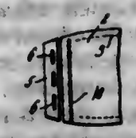
1. A machine for manufacturing an integral book case which extends over the front cover, back portion and back cover of the book to be bound comprising in combination operatively associated means for feeding individual sheets of flexible material, means for trimming said sheets to proper size, means for scoring said sheets parallel to the edge thereof, means for applying adhesive adjacent the edges of said sheets, means for controlling the amount of adhesive applied to said edges, means for folding said edges over against the body of said sheets, means for partially drying said adhesive, means for pressing said folded over edges against the body of said

sheets, means for applying decorative scores to said sheets, means for scoring and rounding the back portion of said sheets, means for collecting completed covers, supports extending longitudinally through said machine, means for adjusting said supports in parallel spaced relation to one another, conveyor belts carried by said supports, means operatively associating said individual means, and means for adjusting the elements operating upon said sheets in coordination with the movement of said supports.

---

2,769,188
**METHODS OF MAKING SHOES**
Walter H. Wedger, Wellesley, Mass., assignor to B. B. Chemical Co., Boston, Mass., a corporation of Massachusetts
Application January 12, 1955, Serial No. 481,379
4 Claims. (Cl. 12—142)

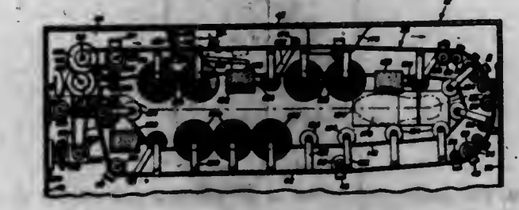
1. That improvement in methods of making shoes which consists in applying rubber latex-resin cement to the margins of an upper and insole prior to assembling the upper and insole upon a last, allowing the cement to dry, assembling the upper and insole on a last, pulling the upper over the insole on the last while the cement is dry and nontacky, subjecting the toe portion of the shoe to dry heat to activate the cement, utilizing a wiper lasting machine to conform the upper to the toe of the last, to lay the margin of the cemented upper over upon the cemented insole and to press the overlasted upper upon the insole, and immediately withdrawing the wipers.



---

2,769,189
**METHOD OF MAKING A SHOE**
Fred L. Ayer, Watertown, Mass.
Application October 8, 1953, Serial No. 384,919
1 Claim. (Cl. 12—142)

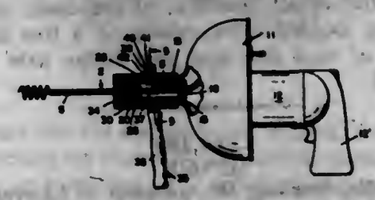
The method which comprises securing the rearwardly directed rear end portion of a shoe outersole member to the rearward portion of an innersole extending rearwardly from a shoe upper to which said innersole has been secured and lasted, stitching said innersole and outersole together forwardly of said securement, cutting off



said innersole and outersole between said stitching and securement along a transverse line, and then folding said outersole about the line of cut to enclose the cut rear ends of said inner and outersole and bringing the re-

mainder of said outersole forwardly underlying said member and a reinforcing stiffening heel member applied to the lower face of said innersole at the heel end, and securing said remainder to said innersole and to said reinforcing heel member.

---



2,769,190
**SHOE POLISHING MACHINE**
Burnis C. Ashley, Houston, Tex.
Application November 4, 1952, Serial No. 318,705
4 Claims. (Cl. 15—31)

1. A shoe polishing machine comprising an endless conveyor, a plurality of shoe engageable brushes, a stationary support for a shoe to be polished, means mounting said endless conveyor for movement about said stationary support, first drive means connected to said conveyor, second drive means connected to said brushes for rotating said brushes, said brushes including a first brush and second brushes, support means mounting said first brush on said conveyor for engagement with a toe only of a shoe, and other support means mounting said second brushes on said conveyor for engagement with sides and the heel only of a shoe.

---

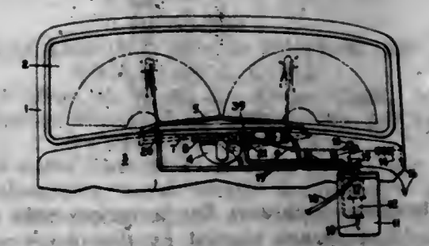
2,769,191
**PLUMBER'S TOOL**
Robert G. Hunt and Walter W. Hunt, Los Angeles, Calif., assignors to Marco Products Company, Los Angeles, Calif., a copartnership
Application January 22, 1954, Serial No. 405,592
5 Claims. (Cl. 15—104.3)

1. In a plumber's snake device, a snake housing in which a plumber's snake can be coiled, said housing having an opening at one side for the passage of the snake, a tubular spindle projecting from said housing axially of said opening, a tubular chuck body housing surrounding said spindle, a thrust bearing mounted in the outer end of said chuck body housing beyond the end of said spindle, a collet chuck between said bearing and said spindle, said spindle and collet chuck having interengaging wedge faces whereby to contract said chuck upon relative movement toward each other of said bearing and said spindle, and interengaging means between said chuck body housing and said spindle for moving the same axially relative to each other, said interengaging means including a manually operable member carried by said chuck body housing, said chuck body housing and said spindle being relatively rotatable.

2,769,192
**WIRE BRUSHES**
Gebhard Satzinger, Bad Kissingen, Germany
Application September 8, 1950, Serial No. 183,744
2 Claims. (Cl. 15—169)

1. A heavy duty wire brush comprising a bristle-mounting support and a bristle guide, said support consisting of a back plate and an inner plate; said inner plate being movable parallel to said back plate and to the bristle guide, and having holes for accommodating and holding in place rivet-like bristle-receiving sockets; individual wire bristle tufts rigidly arranged in said sockets; said bristle guide having holes corresponding to the socket-accommodating holes and being spaced therefrom for receiving said bristle tufts near their free ends and being adjustable longitudinally of said tufts; and means in said brush for moving said inner plate and therewith said bristle-receiving sockets with respect to said back plate and to said guide, and means for clamping said inner plate in adjusted position.

---



2,769,193
**CLEANING BAG FOR DENTURES**
Forest W. Jackson, Los Angeles, Calif.
Application February 9, 1948, Serial No. 7,843
2 Claims. (Cl. 15—210)

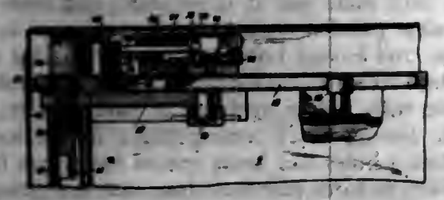
2. A denture cleaning article adapted for a single use before disposal comprising a water absorbent matted fabric envelope having sufficient initial mechanical strength when moistened to withstand manual rubbing manipulation by the fingers to cleanse a denture enclosed therein, the inner surface of said envelope being impregnated with a denture cleaning composition, said envelope being disintegrated to a wadded mass by said manipulation and being thereby limited to a single use.

---

2,769,194
**WINDSHIELD CLEARING SYSTEM**
John R. Oishei, Buffalo, N. Y., assignor to Trico Products Corporation, Buffalo, N. Y.
Application September 30, 1953, Serial No. 383,155
16 Claims. (Cl. 15—250.4)

1. A windshield clearing system for automotive vehicles comprising, means to deliver washing fluid under pressure

to the windshield, a coordinator unit, means operatively connecting said fluid delivery means and said coordinator unit whereby the commencement of operation of said fluid delivery means automatically actuates said coordinator unit, a motor for driving a wiper to and fro across the windshield, control means for said motor, said coordinator being connected to the control means for starting the motor, and a lost motion connection between said coordinator unit and control means whereby said control means are moved by said lost motion connection a predetermined length of time after the actuation of said coordinator unit.



---

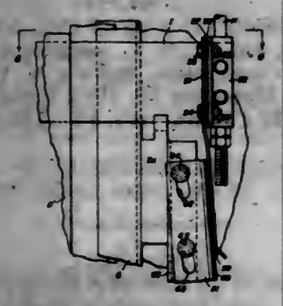
**2,769,195**

## DOOR CHECK WITH FLUID BUMPER

Petter M. Hannaas, Frewsburg, N. Y., assignor to Ellison Bronze Company, Inc., Falconer, N. Y., a corporation of New York

Application March 25, 1953, Serial No. 344,640
14 Claims. (Cl. 16—82)

1. A check for a door having a frame, comprising fluid cylinder means carried by the frame and having closed ends, piston means slidable within the cylinder means in one direction for door opening movement and in the other direction for door closing movement, the piston means forming a chamber at each end of the cylinder means, means operatively connected with the piston means and adapted to be connected with the door frame to move the piston means in the cylinder means as the door opens and closes; a check connection connecting the chambers including a check valve means therein for unidirectional fluid flow therethrough, and valve means movable with the piston means and closing the check connection on a predetermined extent of movement of the piston means in one direction in the cylinder means; and by-pass means communicating with said chambers and at a point beyond the travel of the piston means in at least one direction and having restricted flow therethrough.



---

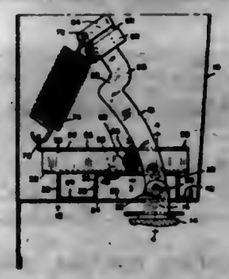
**2,769,196**

## BRAKING MECHANISM FOR SLIDING DOORS AND THE LIKE

Nicholas R. Guilbert, Jr., Chestnut Hill, and Walter B. Keller, Media, Pa., assignors to Guilbert, Incorporated, Philadelphia, Pa., a corporation of Pennsylvania

Application March 31, 1953, Serial No. 345,936
2 Claims. (Cl. 16—85)

1. In braking apparatus for a reciprocally movable object, yielding means carried by the object providing spaced substantially flat surfaces converging in a plane parallel to the path of movement of the object in the direction away from one end of said path, arresting means disposed adjacent said path adapted for engagement by said surfaces at the approach of the object to said end of its path including friction shoes respectively providing surfaces for such engagement whereby said yielding means will be flexed outwardly and thereby retard the approach of the object toward said end of its path, and means supporting the shoes for movement with the object when it is moved away from its arrested position along paths converging in said plane at an angle greater than the angle of convergence of said substantially flat surfaces.



---

**2,769,197**

## DOOR CHECK STRUCTURE

Paul H. Travis, Leonard, and David R. Stamy, Huntington Woods, Mich.; said Stamy assignor to said Travis

Application November 6, 1950, Serial No. 194,212
7 Claims. (Cl. 16—85)

6. Door check structure for controlling opening and closing of an outwardly opening hollow door having an inner side and an outer side and hinged at one edge to a frame having corresponding inner and outer sides on a hinge axis adjacent the outer sides of said door and frame, a rigid check arm having an enlarged head at one end, pivot means adapted to mount the other end of said arm on the frame on a pivot axis adjacent the inner side thereof, a roller adapted to be mounted within the door inwardly from its hinged edge beyond a line joining said axes when the door is closed and spaced toward the inner side of the door from said hinge axis and located generally between said axes, a spring support adapted to be mounted within the door at a point adjacent its outer side and spaced substantially from said hinge axis, and a tension spring connecting said spring support and the headed end of said arm urging said arm toward the hinge axis and maintaining a side of said arm in contact with said roller in all positions of the door, said spring support being located substantially on a line joining the headed end of said arm and said hinge axis when the door is closed.

**2,769,198**

## HINGE

Robert E. Foltz, Sterling, Ill., assignor to Lawrence Bros., Inc., Sterling, Ill., a corporation of Illinois

Application June 24, 1952, Serial No. 295,227
5 Claims. (Cl. 16—169)

3. In a hinge, a pair of hinge leaves, each of said leaves having a plurality of integral knuckles extending along an edge thereof, said knuckles being arranged in interleaved relation and having aligned bore formations, a pin positioned within said bore formations and having at its inner end a peripheral groove, one of said knuckles having an internal wall formation provided with an inwardly opening recess therein and a pin retaining member positioned in said recess, said pin retaining member having a portion provided with a relatively narrow ridge formation extending inwardly into the bore formation of the knuckle and resiliently engaging in said groove, and a tip member having a pin portion extending within the bore formation of said knuckle and overlying portions of said recess to lock therein said pin retaining member.

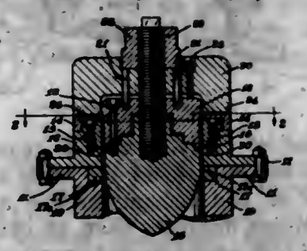
**2,769,199**

## ENGRAVING STYLUS

John A. Boyajean, Huntington, N. Y., assignor to Fairchild Camera and Instrument Corporation, a corporation of Delaware

Application July 1, 1952, Serial No. 296,593
7 Claims. (Cl. 18—1)

1. A stylus for engraving a half-tone plate for image reproduction comprising: a metallic shaft terminating in a deforming tip consisting of a series of coaxial steps, an axial cross section through said steps having a mean outline of non-linear configuration effective to impart a non-linear penetration-deformed area characteristic to a plate engraved by the stylus.



---

**2,769,200**

## RADIAL EXTRUSION DIE

Murrey O. Longstreth and James E. Tollar, Midland, Mich., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

Application March 7, 1955, Serial No. 492,439
1 Claim. (Cl. 18—12)

A die head for the extrusion of organic thermoplastic sheet comprising an internally cylindrical housing adapted to serve as an extension of a means for supplying fused plastic matter continuously, an internal core coaxial with said housing and fixedly spaced therefrom to provide a passageway therebetween of annular cross-section and to distribute plastic matter substantially uniformly about said passageway, and a centrally rigid and circumferentially yieldable crown member secured to and spanning said core and coaxial therewith, said crown member having a plurality of adjustable pressure and tension means for altering controllably the orifice spacing between any portion of the inner circumferential face of the crown and the proximal opposed face of the housing, at least one of the core and crown members serving to divert the plastic matter from its longitudinal flow through the said annular passageway to a circumferentially radial orifice between a face of said member and the end of the said housing distant from the plastics supply means.

---

**2,769,201**

## SCREW EXTRUSION APPARATUS FOR MANUFACTURING ARTICLES OF THERMOPLASTIC AND THERMOSETTING MATERIALS

Zareh Loresian, Milan, Italy

Application June 23, 1949, Serial No. 100,823
Claims priority, application Italy July 1, 1948
9 Claims. (Cl. 18—13)

1. A screw extruder for manufacturing articles from a material formable under heat, comprising in combination, a stationary casing having an inner wall and an inlet opening for the material; a screw rotatably mounted in said casing coaxially thereof, said screw upon rotation conveying the material entering through said inlet opening through the casing; a nozzle head forming the outlet of said casing; heating and cooling means in said casing for keeping the temperature of the material in said casing substantially constant; said casing having straight longitudinal grooves in its inner wall extending in the direction of the axis of said casing up to said nozzle head, said grooves forming interruptions of the surface of the inner wall of said casing, whereby said grooves receive quantities of the material sufficient for preventing a tangential movement and sliding of the material on the inner wall of said casing so as to render impossible a sticking of the warm material to said screw during the conveying of the material through the casing.

---

**2,769,202**

## MOLDING APPARATUS

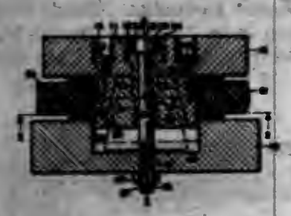
Earl H. Thompson, Port Orchard, Wash.

Application July 10, 1953, Serial No. 367,375
4 Claims. (Cl. 18—34)
(Granted under Title 35, U. S. Code (1952), sec. 266)

3. Apparatus for molding flowable material comprising male and female molds adapted when mated to form a mold cavity, a recess provided in one of said molds, a diaphragm covering said recess and forming a part of said mold cavity, pressure reducing means communicating with the interior of said recess beneath said diaphragm, and sprue means communicating with said mold cavity for feeding material into the cavity and over said diaphragm, said pressure-reducing means being operable during said feed for drawing said diaphragm into said recess for forming an expanded mold cavity.

---

**2,769,203**



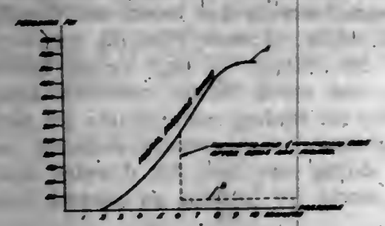
## VULCANIZING MOLD HAVING AN ADJUSTABLE CORE

William M. Wood, San Diego, Calif.

Application March 30, 1953, Serial No. 345,748
8 Claims. (Cl. 18—45)
(Granted under Title 35, U. S. Code (1952), sec. 266)

6. A vulcanizing mold which comprises a support member, a core means formed of a plurality of segments slidably mounted on said support member whereby the effective outer diameter of said core means is variable, means for altering the relative position of said segments

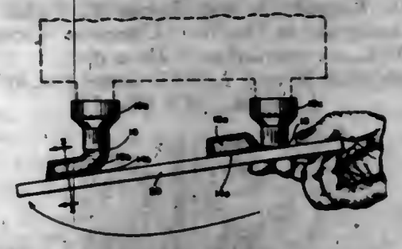
and said support member, means to selectively actuate said altering means, a clamping member positioned adjacent said segments and spaced from said support member thereby providing a space between said members for receiving a body to be vulcanized, and means for moving said members toward one another and clamping said body therebetween.



2,769,204
METHOD OF PRODUCING PLASTIC SHROUDED SPOOLS
Louis H. Morin, Bronx, N. Y., assignor to Conts & Clark Inc., a corporation of Delaware
Application July 12, 1951, Serial No. 236,360
12 Claims. (Cl. 18—47.5)

1. The method of making spools each comprising a flanged barrel from paper tubing which comprises continuously extruding plastic upon the outer cylindrical surface of a paper tube to form a plastic shell on the tube, severing the plastic covered tube into lengths to form the barrel of each spool, forming an annular recess at each end portion of each barrel, and forming an annular flange at each said end portion outwardly of said annular recess, said flange being at least partially made of plastic material.

2,769,205
EXPANDED CELLULAR RUBBER WITH ELLIPTICAL CELLS AND METHOD OF MAKING
Hans Pfleumer, New Brunswick, N. J., assignor to Rubatex Products, Inc., New York, N. Y., a corporation of Delaware
Application April 3, 1952, Serial No. 280,284
2 Claims. (Cl. 18—53)



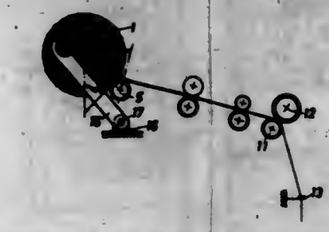
1. The method of making closed cell cellular expanded rubber, comprising the steps of preparing a rubber mix including a finely dispersed material which, on the application of heat, generates a gas, subjecting the rubber mix to a temperature sufficient to generate said gas, partially curing said rubber mix during generation of said gas and confining said rubber mix against expansion under the relatively high pressure of said generated gas, permitting said internally generated gas to expand said rubber mix to a limited extent in one direction thereby reducing said gas pressure from said relatively high value to a substantially reduced, slightly superatmospheric value, and confining the expanded rubber mix against further expansion under said reduced gas pressure while fully curing the same.

2,769,206
METHOD FOR PACKAGING FLUIDS, JELLIES, PASTES AND FLUENT POWDERS
Grant W. Cheney and Arnold L. Stark, Midland, Mich., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Delaware
Application October 9, 1952, Serial No. 313,908
1 Claim. (Cl. 18—56)

The method which comprises supplying a tube having a wall thickness of from 15 to 40 mils, open at one end and sealed at the other, composed of a normally crystalline vinylidene chloride copolymer in the supercooled condition, placing said tube in a mold whose cavity has the shape of a collapsible dispensing tube and is of from 2.5 to 5 times the length and diameter of the supercooled tube, said mold being gated in one end at a point corresponding to the neck of a collapsible tube; securing the open end of the tube against longitudinal slippage in the gate of the mold, said gate being threaded to imprint threads on the neck of the tube; and applying fluid pressure through the open end of the tube sufficient to distend the tube longitudinally and radially into conformity with the mold and to effect orientation and crystallization of the polymer constituting the body of the so-distended collapsible tube, while warming the mold near the gate area to crystallize the copolymer confined therein.

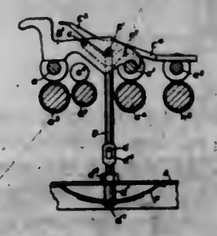
2,769,207
METHOD FOR DISPENSING AND APPLYING HIGHLY VISCOUS CEMENTS
Frank L. Stevens, Lexington, Mass., assignor to W. F. Webster Cement Company, Cambridge, Mass., a voluntary association of Massachusetts
Application December 24, 1954, Serial No. 477,542
1 Claim. (Cl. 18—59)

The method of applying viscous cement to tiles and similar units which includes the steps of extruding triangular rods of said cement through a multiplicity of nozzles at varying distances from an operator's position, engaging said rods nearer to said operator's position along sides thereof nearest thereto with the top surface of a unit, moving said unit in an arc to deposit therealong said nearer rods on said sides thereof and to similarly engage corresponding sides of rods farther from said operator's position and to deposit along said unit said farther rods on said sides thereof, and cutting off said rods by scraping said unit against a linear edge on each of said nozzles.

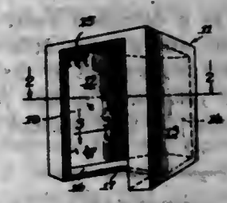


2,769,208
GIN BREAST OPENING MECHANISM
Frank E. Deeme, Birmingham, Ala., assignor to Continental Gin Company, Birmingham, Ala., a corporation of Delaware
Application June 12, 1953, Serial No. 361,189
6 Claims. (Cl. 19—88)

1. A cotton gin comprising a breast member and a frame member, said breast member being movable with respect to said frame member, a leverage system connecting said breast and said frame member and operable to move said breast with respect to said frame member, a motor in driving engagement with said leverage system for operation thereof including a planetary gear mechanism for selecting the direction of movement of said leverage system when driven by said motor.



2,769,209
LAP OR BOBBIN FEED SYSTEM FOR SPINNING MACHINES
Johann Jacob Keyser, Aarau, Switzerland, assignor to Schlees Aktiengesellschaft, Duesseldorf-Oberkassel, Germany
Application October 25, 1950, Serial No. 192,134
Claims priority, application Switzerland October 29, 1949
13 Claims. (Cl. 19—130)



1. In a system for changing the condition of fibrous material for use in connection with textile machines, which includes a plurality of relatively closely spaced lower roller means supporting correspondingly arranged upper roller means, one of said lower roller means being arranged to be motor driven, shaft means, fibrous material wound upon said shaft means and resting on said one roller means so that the vertical plane through said shaft means is located outside the vertical plane through said one roller means, said fibrous material while in wound condition on said shaft means representing one of said upper roller means cooperating with said relatively closely spaced lower roller means and being arranged for passing fibrous material over an arched portion of said one lower roller means, said arched portion automatically increasing with the unwinding of fibrous material from said shaft means.

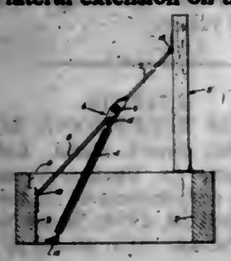
2,769,210
MECHANISM FOR APPLYING PRESSURE TO THE DRAFTING ROLLERS OF SPINNING AND OTHER TEXTILE PREPARATION MACHINERY
Ramon Balmes Solanas, Barcelona, Spain, assignor to Estirajes Balmes, S. A., Barcelona, Spain, a body corporate of Spain
Application July 8, 1954, Serial No. 442,027
3 Claims. (Cl. 19—135)

1. A saddle weighting mechanism for the top drafting rollers of spinning and other textile preparatory machines having a plurality of consecutive pairs of top and bottom front, second and rear drafting rollers disposed in upper and lower lines, comprising a saddle bearing on the top front roller and on the top second roller, a weight applying lever pivoted to the saddle intermediately of the front and second rollers to rest on the top rear roller, an actuating lever pivoted to the saddle and having a cam surface on one end thereof engaging the weight applying lever, a weight hook rod pivoted to the actuating lever, a leaf spring mounted below the lines of rollers, and a rod connecting the leaf spring to the weight hook rod for applying pressure through the weight applying lever and saddle to the lines of rollers.

2,769,211
DOORLESS TELEPHONE BOOTH
Frederick G. Hewitt, South Bend, Ind., assignor, by mesne assignments, to Burgess-Manning Company, Libertyville, Ill., a corporation of Illinois
Application April 30, 1954, Serial No. 426,817
6 Claims. (Cl. 20—3.5)

1. A doorless telephone booth having a pair of vertical side walls converging from front to rear of said booth at an angle of not less than about 45 degrees and not more than about 60 degrees, said walls comprising sound-absorbing construction whereby sound waves incident to the inner surfaces thereof are largely absorbed, the forward extremities of said side walls being spaced apart a sufficient distance to receive at least the vertical torso of a person therebetween, and a top wall for said booth.

2,769,212
WEATHER PLATE
Andrew B. Hammitt, Trenton, and Herbert L. Birum, Jr., Titusville, N. J.
Application November 9, 1953, Serial No. 390,918
9 Claims. (Cl. 20—4)



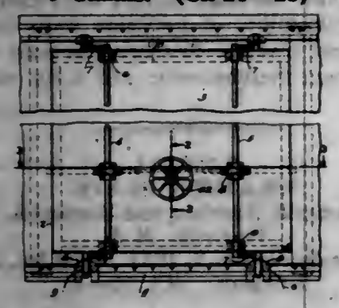
1. A weather plate for use in building constructions wherein a plurality of batten strips abut, said weather plate comprising a generally rectangular cover piece having cover portions thereof bent diagonally inwardly and a flexible sealing sheet having a preformed batten strip engaging face shaped to conform to the outer contour of the batten strips to be sealed, said sheet having thickened edge portions engageable by said inwardly bent portions of said cover plate, said edge portions of said sheet will be urged laterally into sealing engagement with the sides of said batten strip when said cover piece is secured in place.

2,769,213
DOOR AND CLOSER ASSEMBLY
Erskall L. Stetson, Gering, Nebr.
Application November 13, 1953, Serial No. 391,825
1 Claim. (Cl. 20—16)

In combination, a door frame having first and second jambs, said jambs having forward edges, a door having an outer edge and inner edge, said inner edge of the door being hinged on the forward edge of said first jamb, a first straight arm having inner and outer ends, the outer end of the first arm being pivoted to the door at a point

intermediate the edges of the door, a second straight arm having outer and inner ends, the outer end of said second arm being pivoted to said second jamb at a point spaced rearwardly from the forward edge of the second jamb, means pivoting the inner ends of said first and second arms together, a lateral extension on the inner end of said

first arm projecting in a direction away from the door and toward said jambs, and a contractile spring stretched between said extension and a point on the door frame adjacent to said second jamb and spaced rearwardly from the pivoted connection of said second arm with said second jamb.



---

2,769,214

## RAILWAY REFRIGERATOR CAR DOOR

Edward P. Wright, Glendale, Calif., assignor to Chicago Railway Equipment Company, Chicago, Ill., a corporation of Illinois

Application November 25, 1953, Serial No. 394,417
9 Claims. (Cl. 20—23)

2. In a door construction for a railway car having a wall provided with a door opening, the combination with a door adapted to close said opening, of means for supporting said door and moving same bodily laterally into, and out of, said opening, including a pair of vertically disposed operating crank shafts journaled on the door, a rotatable operating member mounted on said door, a pair of elongated axially aligned horizontal members movable toward and away from each other, a member having threaded engagement with said horizontal members, and axially aligned therewith, gear means engaging said threaded member and operating member, and means engaging each of said horizontal members to one of said shafts for rotation of the latter upon actuation of said operating member.

---

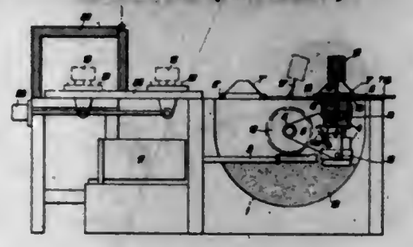
2,769,215

## WEATHER STRIP

Lewis T. Neff, Roswell, N. Mex., assignor of one-fourth to Lewis E. Neff, one-fourth to Edsel B. Neff, and one-fourth to George D. Neff

Application January 19, 1954, Serial No. 404,953
1 Claim. (Cl. 20—68)

A weather stripping arrangement comprising a channel-shaped member, means for attaching said channel-shaped member to a supporting structure, a first resilient pad received in said channel-shaped member, a pad supporting element slidably received in said channel-shaped member, said pad supporting element including a pressure plate adapted to engage said first resilient pad, and a supporting plate spaced from said pressure plate, a second resilient pad affixed to said supporting plate outwardly of said channel-shaped member, and means limiting the outward movement of said pad supporting element from said channel-shaped member, said means including flanges attached to said channel-shaped member for retaining said pressure plate within said channel-shaped member.



---

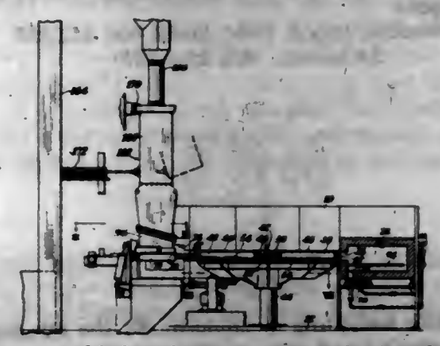
2,769,216

## METHOD OF AND APPARATUS FOR PRODUCING HOLLOW CORES FOR FOUNDRY PURPOSES

Adolf Dick and Franz Pölzgutter, Bochum, Germany

Application June 29, 1953, Serial No. 364,893
Claims priority, application Germany June 28, 1952
8 Claims. (Cl. 22—10)

1. Apparatus for producing hollow cores of the kind described comprising a container for holding a supply of the sand-synthetic resin mixture under atmospheric pressure, a ladle member carried by a rocker arm in said container, means for rocking said arm so as to enable the ladle to pick-up a charge from the said supply and a blower head member connected to said container and arranged so that said ladle member may be rocked by said means into sealed connection with the said blower head member and means enabling a fluid under pressure to be introduced through said blower head member into the ladle member when the ladle member is in sealed connection with the blower head member so that the mixture can be blown from the ladle member into a core box arranged to receive it.



---

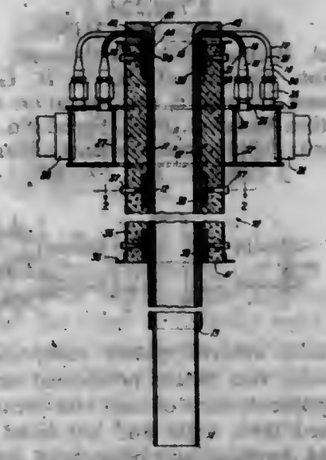
2,769,217

## MOLD FORMING APPARATUS

Ralph P. Davis, Squantum, Mass., assignor, by mesne assignments, to Link-Belt Company, Chicago, Ill., a corporation of Illinois

Application April 11, 1952, Serial No. 281,766
7 Claims. (Cl. 22—21)

4. In a mold forming apparatus, the combination of a conveyer, a loading station, a plurality of pattern means rotatably mounted on said conveyer for movement therewith, rotatable flask means at said loading station and movable relative to said conveyer for engagement with a selected one of said pattern means, means for inverting said flask means, means for clamping said flask means to said one pattern means, means for loading mold forming material upon said one pattern means for retention by said flask means, and means for actuating said flask inverting means for rotating the assembly of said flask means and one pattern means for dumping excess mold forming material therefrom.



---

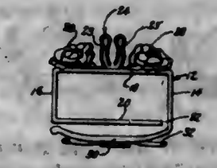
2,769,218

## CONTINUOUS CASTING MOLD

Isaac Harter, Isaac Harter, Jr., and Temple W. Ratcliffe, Beaver, Pa., and Frank W. Armstrong, Jr., Barberton, Ohio, assignors, by mesne assignments, to The Babcock & Wilcox Company, Jersey City, N. J., a corporation of New Jersey

Application October 25, 1951, Serial No. 253,114
5 Claims. (Cl. 22—57.2)

1. A mold assembly comprising an upright open ended mold liner of substantially uniform cross-sectional shape and area throughout its extent, an inlet manifold for cooling fluid spaced from and encircling said mold liner, a plurality of abutting cooling fluid guide tubes extending throughout the upper portion of the external surface of said mold liner in heat exchange contact therewith to an open discharge position spaced from the lower end of said mold, and an upward extension of each of said tubes above said mold liner and connected with said inlet manifold.



---

2,769,219

## HOLDER FOR CIGARETTE PACK AND RELATED ARTICLES

Joseph F. Elkavich, Nashua, N. H.

Application February 25, 1955, Serial No. 490,506
2 Claims. (Cl. 24—81)

1. A holder for a cigarette package of the type having a rectangular cross section, and for an associated match book, comprising: a one-piece band of a resilient material, formed to a width such that it will girdle a cigarette package belt-fashion intermediate opposite ends of the package while leaving said ends exposed, said band including a flat front portion proportioned to extend across the front of said package fully from one side of the package to a location short of but spaced closely from the other side thereof, a flat first side portion integral at one end with one end of the front portion and lying in a plane normal to that of the front portion, a flat back portion integral at one end with the other end of the first side portion and lying in a plane paralleling that of the front portion, said back portion being longer than the front portion to an extent sufficient for extension of the back portion the full distance across the back of the package, a flat second side portion lying in a plane paralleling that of the first side portion and integral at one end with the other end of the back portion, said first and second side portions projecting forwardly from the back portion with the second side portion projecting a greater distance from the back portion than does the first side portion, said second side portion projecting forwardly beyond the plane of the front portion and being spaced at its front end from the other end of the front portion, and a clip element integral at one end with the front end of the second side portion and extending in front of the front portion the full distance between the side portions, the other ends of the front portion and clip element being free with the other end of the front portion being disposed in back of said one end of the clip element and the other end of the clip element being disposed in front of said one end of the front portion, said front portion and clip element being resiliently, yieldably spreadable responsive to the insertion of a book of matches therebetween for gripping of said package between the front and back portions and gripping of said book of matches between the clip element and front portion.

---

2,769,220

## RELEASABLE BUCKLES

Frank Bernard Harley, Egham, England

Application July 17, 1950, Serial No. 174,149
Claims priority, application Great Britain February 3, 1950
7 Claims. (Cl. 24—193)

1. A releasable buckle for connecting a strap to another part comprising a body with parallel sides and closed ends affording a main anchorage adjacent one end for connection to the part to be connected to the strap, said body having intermediate its ends a transverse gripping edge having a rounded surface free of projections and provided with subsurface means to increase the frictional grip between it and the strap, said rounded surface being tangent to and defining a primary reference plane passing through said main anchorage, and an auxiliary anchorage about which the free end of the strap is looped in working position, said auxiliary anchorage being supported by said body intermediate its ends and lying parallel to the gripping edge between it and the main anchorage and spaced from said primary reference plane and from said gripping edge, said auxiliary anchorage being on the same side of said primary reference plane as the gripping edge, and said buckle being formed at its end remote from said main anchorage with means offset from said reference plane on the opposite side thereof to said gripping edge for preventing said primary reference plane and gripping edge from alining with the direction of the applied load by more than the thickness of the strap with which the buckle is designed to be used.

---

2,769,221

## SEPARABLE FASTENERS

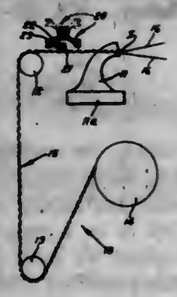
Herbert A. Maimann, Havertown, Pa., assignor of one-half to H. Robert Mandell, New York, N. Y.

Application May 20, 1953, Serial No. 356,126
4 Claims. (Cl. 24—216)

1. In a separable fastener of the stud and socket type, the combination of a socket having a first bore of relatively small diameter terminating in a shoulder, said socket also having a second bore of larger diameter than said first bore beyond said shoulder to provide a relatively thin wall portion on said socket, a stud retaining member

mounted on said shoulder, said stud retaining member having a pair of spaced arms adapted to engage a stud inserted into said socket and a peripheral portion connecting said arms and disposed thereabout, said peripheral portion having parts in a common plane and another part

spaced from said common plane and connecting said common plane parts, and a plurality of circumferentially spaced prongs on said thin wall portion extending over onto those of said stud retaining member peripheral portion parts as are disposed in said common plane and holding said stud retaining member against said shoulder.



---

2,769,222

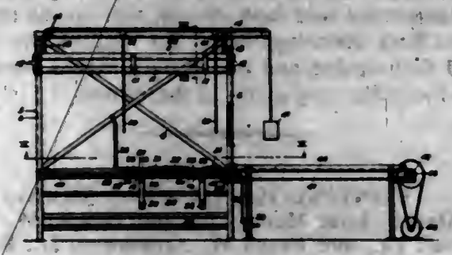
## FABRIC AND METHOD OF MAKING SAME

Raymond J. Southwell, Nichols, Conn., Mary Elizabeth Southwell, executrix of said Raymond J. Southwell, deceased

Application April 10, 1950, Serial No. 154,905
3 Claims. (Cl. 28—73)

1. The method of making open mesh glass fiber fabric having precoated high temperature and moisture resistant thermoplastic coated glass fiber strands comprising weaving said strands into an open mesh fabric of warp and weft strands and maintaining the warp strands thereof under tension, then while said warp strands are under tension applying sufficient fusing heat in a zone to the woven fabric where the warp strands are under said tension to soften said thermoplastic coatings of the strands to have the coatings of the warp and weft strands of the fabric fuse to one another, and then continuing movement of said fabric from said zone to have said coatings cool and reset at the places of crossing of said warp and weft strands and form bonds securing the warp and weft strands to one another.

---



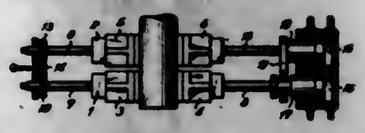
2,769,223

## VENETIAN BLIND ASSEMBLY MACHINE

Harry S. Rosenbaum, Baltimore, Md.

Application July 18, 1951, Serial No. 237,359
8 Claims. (Cl. 29—24.5)

8. A machine for assembling slats and ladder tapes of Venetian blinds comprising a vertically movable carriage to which ladder tapes of the blind being assembled may be secured, a feeding device for each ladder tape having means for alternately engaging and releasing the cross tapes of the ladder tapes to control movement of the tape through the device, means for moving the carriage and the ladder tapes secured thereto, movement of the carriage being controlled by said tape feeding devices, and means positioned at a point adjacent the path of movement of the tapes for feeding slats horizontally between the cross tapes and the side tapes of the ladder tapes as the tapes pass the slat feeding means.



---

2,769,224

## SAWING MACHINE

Richard Hake, Remscheid-Vieringhausen, Germany, assignor to Joh. Friedrich Ohler O. H. G., Remscheid-Vieringhausen, Germany, a corporation of Germany

Application March 2, 1954, Serial No. 413,683
Claims priority, application Germany March 11, 1953
2 Claims. (Cl. 29—67)

1. A hydraulic control system comprising a base, a pair of hydraulic vise means positioned on said base in parallel arrangement, each of said vise means including a pair of opposed jaws, right and left hand screw means supporting said opposed jaws of each of said vise means, means for operating selectively one or both said vise means, said operating means for each of said vise means including a hydraulic cylinder, a piston reciprocating in said cylinder and a piston rod connected with the corresponding of said vise means, and means for connecting said piston of one of said cylinders with that of the other of said cylinders, thereby exerting the pressure of both said pistons on one of said vise means.

---

2,769,225

## CUTTING AND ABRADING TOOL

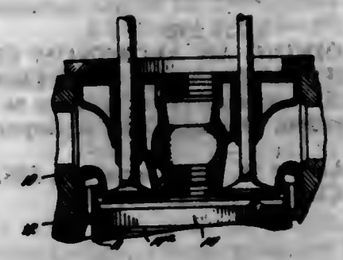
Christopher Hodgson Booth, Sheffield, England, assignor to Firth-Brown Tools Limited, Sheffield, England, a British company

Application May 2, 1952, Serial No. 285,673
Claims priority, application Great Britain May 3, 1951
10 Claims. (Cl. 29—78)

1. A cutting tool of the kind comprising a tool body having a multiplicity of successive cutting edges on one surface thereof, the edges having positive rake and clearance angles and all facing in the same general direction for cutting, and at least some of the edges being divided along their length by spaced parts which are staggered in relation to the parts of other edges and which form, non-cutting rubbing surfaces with ramp-like leading portions, which rubbing surfaces lie below the cutting edges by an amount equal to the maximum permissible depth of cut desired and, passageways in front of the cutting edges at a level substantially below the rubbing surfaces, for clearance of chips, said passageways leading to an external surface of the body, whereby when the edges are cutting to the maximum depth the non-cutting surfaces rub on the work and so prevent the edges from

cutting deeper and also prevent the surface of the work from closing the clearance passageways.

8. A tool as claimed in claim 1 in which the body is of circular section and the cutting edges lie on the circumferential surface.



---

2,769,226

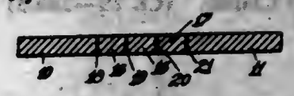
## METHOD OF WELDING CYLINDER TO HEAD

Ralph E. Van Deventer, Detroit, Mich., assignor to Studebaker-Packard Corporation, a corporation of Michigan

Original application April 24, 1950, Serial No. 157,762. Divided and this application February 25, 1953, Serial No. 338,691
1 Claim. (Cl. 29—156.4)

The method of fabricating a one piece cylinder assembly defining a closed dome at one end of the combustion chamber for an internal combustion engine, which comprises the steps of forming upon the cylinder head an integral peripheral flange having an annular end surface spaced apart from the inside surface of the dome and having a cylindrical inner face disposed between the two said surfaces, forming a barrel with a cylindrical flange of predetemined length at one end offset inwardly from the inner wall of the body of the barrel and a transversely extending intermediate wall portion joining the barrel body and the cylindrical flange integrally together at that end, the wall portion presenting an annular end surface included between the respective junctures of the wall portion and each of the body of the barrel and the cylindrical flange thereof and maintaining the coaxial stepped relationship whereby the inner wall of the barrel body and the outer wall of the cylindrical flange are substantially longitudinally aligned, said cylindrical flange closely engaging the inwardly facing cylindrical surface of the flange of the head when it is inserted within said encircling flange to establish coaxial relationship between said head and the body of the barrel with the predetemined length to which the cylindrical flange is formed being such that when it is inserted into the encircling peripheral flange of the head it will, by abutting the dome in said head function as a stop limiting the extent of such insertion and accurately locating the mutual facing annular end surfaces of head and barrel in desired spaced relationship, filling the space between said annular end surfaces with weld metal to permanently unite the head and barrel, and thereafter cutting away the said cylindrical flange and the stepped transversely extending wall portion to provide a continuous cylindrical inner surface extending from the body of the barrel beyond the weld.

---



2,769,227

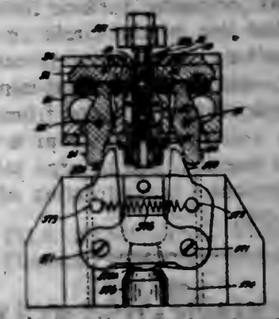
## WELDED JOINT BETWEEN FERRITIC AND AUSTENITIC STEEL MEMBERS

Charles Sykes and Henry William Kirkby, Sheffield, England, assignors to Thos. Firth & John Brown Limited, Sheffield, England, a British company

Application November 28, 1951, Serial No. 258,761
Claims priority, application Great Britain March 6, 1951
7 Claims. (Cl. 29—196.1)

3. A welded joint structure comprising a first structural member of a ferritic steel having a thermal coefficient of expansion of 0.000014, a second structural member of an austenitic steel having a thermal coefficient of expansion of 0.000018 and a plurality of intermediate rigid component layers of austenitic steel directly sandwiched between said first and second structural members and positioned successively from one structural member to the

other with the intermediate layers in direct contact and in welded fixture with the structural members and with each other where they contact, said intermediate layers having thermal coefficients of expansion which increase in successively substantially equal steps from the said coefficient of the first structural member to that of the second structural member.



---

2,769,228

## ASSEMBLING MACHINE

James S. Burge, Anderson, Hilton J. McKee, Middletown, Ray T. Alexander, Pendleton, and Loris H. Conrad, Warren M. Rider, Gustave H. Neetzel, and James F. Salatin, Anderson, Ind., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application April 11, 1951, Serial No. 220,482
3 Claims. (Cl. 29—203)

1. In a machine for assembling a push button switch including a nonconducting case having a side opening therein and an eyelet receiving hole, a metal case mounting member having an eyelet receiving hole, a metal eyelet for attaching the case to the member, a push button extending through the eyelet, a contact attached to the button and engaging the eyelet, a spring in the case for urging the contact against the eyelet, a spring retainer in contact with said spring in said case and a terminal providing member attached to the case at said side opening and engaged by the spring retainer, the combination comprising a plurality of work holder supports, a conveyor for moving the supports successively to a plurality of stations, means for indexing the conveyor, each support having a holder which supports a first assembly of eyelet, mounting member and nonconducting case and a second assembly of button and contact when inserted within the case, and a spring supported by the second assembly and a spring retainer therefor, said retainer being adapted to be moved toward the button and away from said side opening for compressing said spring preparatory to assembling the terminal providing member with the case, means at a station for pushing said retainer toward the button and out of register with said opening, means provided by the holder for engaging the retainer to keep said spring in a compressed state, means for advancing the retainer engaging means through said case opening and into engagement with said retainer while the spring is compressed, means for retracting the retainer engaging means, said terminal providing member being adapted to be secured to the case by bending a part thereof into said side opening of the case, and means provided by the retainer engaging means for bending said part when the retainer engaging means is retracted.

2,769,229

## TOOL FOR EXTRACTING WIRE COIL INSERTS

John O. Forster, Harrison, N. Y., assignor to Heli-Coil Corporation, Danbury, Conn., a corporation of Delaware

Application February 12, 1954, Serial No. 409,930
3 Claims. (Cl. 29—240.5)

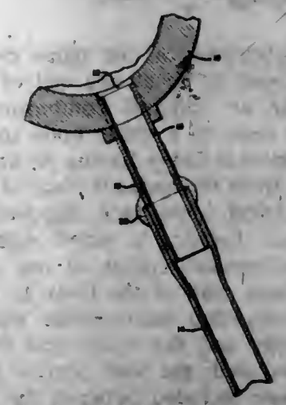
1. A tool of the class described comprising a rotatable shaft, a plurality of members spaced circumferentially of the shaft and connected to the shaft for rotation therewith, portions at least of said members extending longitudinally of the shaft and converging in the direction of the axis of rotation thereof to form a cage-like structure tapering axially of and rotating with the shaft, and a lateral extension formed on one of the members having an inner work engaging surface forming an acute angle with a radial line of the circle circumscribed by the members revolving in operative direction about the axis of the shaft, said acute angle opening towards the inside of said circle, thus to engage from the outside a convolution of a coil projecting from a work-piece in which said coil is inserted, and to urge said convolution inwards of said structure upon rotating of the shaft coaxially with the coil.

2,769,230

## METHOD OF FABRICATING RAILWAY CAR LADDERS

Karl F. Nystrom, Chicago, Ill., assignor to International Steel Company, Evansville, Ind., a corporation of Indiana

Original application February 1, 1952, Serial No. 269,384. Divided and this application June 11, 1953, Serial No. 361,045
6 Claims. (Cl. 29—428)



1. The method of fabricating railway car ladders with integral supporting brackets on each end thereof which comprises cutting-out portions of the flanges of angle members in portions spaced from the adjoining webs in shapes constituting pairs of trapezoidal cut-outs having a common hypothetical central boundary with the sides of the trapezoidal cut-outs diverging in opposite directions from said common hypothetical central boundary, with the terminating adjacent edge of one of the trapezoidal cut-outs spaced from the web of the angle member and the opposite side of the other of said trapezoidal cut-outs extending coincident with the longitudinal terminating edge of the first mentioned flange, forming the ends of said angle members into brackets with the first mentioned longitudinal edge of said first mentioned trapezoidal cut-out and the adjacent sides thereof forming an opening constituted by an open segment and chord and the side of the other of said trapezoidal cut-out adjacent the edge coincident with the longitudinal terminating edge of said flange forming abutting edge-to-edge limit stops extending on a line substantially normal to the said chord, and securing treads between the flanges of said angle members.

2,769,231

## METHOD OF JOINING AN ALUMINUM TUBE TO A STEEL REFRIGERATOR COMPRESSOR

Leland H. Grenell, Oakwood, Ohio, assignor to General Motors Corporation, Dayton, Ohio, a corporation of Delaware

Application August 19, 1952, Serial No. 305,220
3 Claims. (Cl. 29—471.7)

1. The method of joining an aluminum refrigerant line to a steel compressor which comprises first coating one end portion only of a steel tube with aluminum, secondly silver soldering the uncoated end of said steel tube to the body of said compressor and thereafter inert gas welding said aluminum refrigerant line to said aluminum coating.

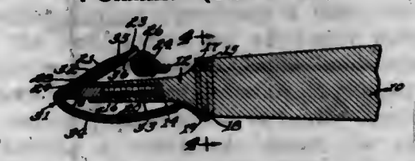
2,769,232

## SAFETY RAZOR

Albert J. Leonard, Sr., Los Angeles, Calif.

Application November 30, 1953, Serial No. 395,111
10 Claims. (Cl. 30—60.5)

1. A safety razor comprising: a shaving head including a guard element and a cover movably mounted thereon to occupy open and closed positions to accordingly release a blade or clamp same between the cover and guard element with the cutting edge of the blade exposed for shaving; a handle composed of telescopically associated sections, to one of which the guard element is fixed; means operatively connecting the other handle section to said cover for movement of the latter to open or closed position according as the handle sections are relatively moved axially from one extreme position to another; an actuating member; means operatively connecting said actuating member to said one handle section for said axial movement with the latter as a unit and for rotational movement independently of said one handle section; and cam means interposed between the perimeter of said actuating member and the confronting annular surface of said other handle section, co-acting with the latter and and handle in response to relative rotational movement therebetween in one direction, to lock the handle sections against said relative axial movement.

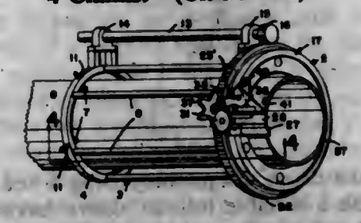


2,769,233

## SAFETY RAZOR

Jeptha Ivey Duke, Miami, Fla.

Application August 12, 1954, Serial No. 449,321
4 Claims. (Cl. 30—69)



4. In a safety razor, a handle provided with an exteriorly knurled surface, a shank extending from said handle and provided with a threaded socket, there being a groove in said handle, a support member including a collar surrounding said groove, a securing element projecting through said collar into said groove, a bracket extending from said collar, a base arranged angularly with respect to said bracket and extending therefrom, there being an opening in said base, a pair of apertured ears extending from said base, a roller having trunnions journaled between said ears and provided with a plurality of grooves, said roller being spaced from the free edge of said base, a blade arranged contiguous to said base and provided with an opening registering with the opening in said base, a clamp including a stem projecting through the registering openings in said blade and base, said stem engaging the socket in said shank, said clamp including a body portion contiguous to said blade, and a curved portion engaging said bracket.

2,769,234

## PORTABLE PIPE BEVELING APPARATUS

James L. Young, Houston, Tex.

Application December 22, 1954, Serial No. 477,047
4 Claims. (Cl. 30—97)

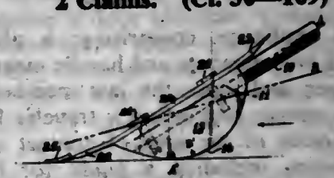
1. A portable pipe beveling apparatus comprising, a cage surrounding the pipe to be beveled, longitudinally spaced supports on said cage and circumferentially engaging the pipe to be beveled for supporting the cage thereon, a head rotatably supported on said cage for movement about the pipe to be beveled, beveling cutter means mounted on said head and extending inwardly to engage and bevel cut the pipe on which said cage is supported, spring means associated with said head and connected to said cutter means for accommodating movement of said cutter due to irregularities in the pipe, roller means on said cutter means for supporting said cutter on the pipe as said cutter is moved thereabout, means for rotating said head about the pipe and additional means for progressively advancing the cutter inwardly as said head is rotated to progressively bevel cut the pipe.

2,769,235

## PORTABLE PIPE CUTTING MACHINE

Arthur E. Martois, Los Angeles, Calif.

Application March 14, 1955, Serial No. 494,201
2 Claims. (Cl. 30—97)



1. A portable pipe cutting machine comprising a frame, one part of said frame being substantially circular in form, a ring shaped chuck, means rotatably mounting said chuck in the circular portion of the frame, a motor, drive means extending from said motor to the chuck, idler rollers mounted on the chuck, a cutter wheel, a holder on which the cutter wheel is journaled, means pivotally mounting said holder on the chuck, a ratchet wheel, a shaft projecting from the ratchet wheel, said shaft being journaled in said chuck and engaging said holder, a cam surface on the ratchet wheel, a pin on the chuck engaging said cam surface to advance said ratchet wheel and shaft against said holder, and means on said frame engageable by said ratchet wheel to rotate said ratchet wheel at each rotation of the chuck.

2,769,236

## TILE REMOVING TOOLS

Andrew Thomas Phillips and Ralph J. Collins, Columbus, Ga.

Application December 17, 1953, Serial No. 398,750
2 Claims. (Cl. 30—169)

1. A tile removing tool comprising a handle, a square shank at one end of said handle and having openings therethrough, a weighted cast iron casting having an open top square slot therein complemental to the shank of said handle and having openings in the bottom of said slot, a double ended reversible scraper blade having openings therethrough, a beveled end for attacking the work surface, and removable attaching means between said casting, shank and blade passing through the openings thereof whereby said blade is held rigidly in place along said shank and casting and backed by the weight mass of said casting to provide a weighted thrust to said blade when the blade is attacking the tile.

2,769,237

## PRUNING SHEARS

Samuel Oxhandler, Hamden, Conn., assignor to Sargent & Company, New Haven, Conn., a corporation of Connecticut

Original application October 29, 1952, Serial No. 317,485, now Patent No. 2,715,270, dated August 16, 1955. Divided and this application June 6, 1955, Serial No. 513,315
2 Claims. (Cl. 30—254)

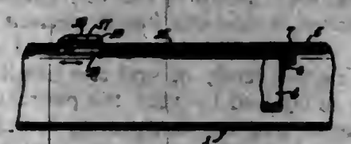
1. A pruning implement comprising a pair of pivoted, cooperating shearing members, a handle carrying each

of said members, said members extending laterally at an angle to the longitudinal dimension of the handles, and the upper end of one handle lying below a portion of the other handle to contact the latter and limit closing movement of the handles, one of said shearing members being a cutting blade having a shank member to which the upper end of said one handle is secured, and said last-

named handle having a rounded outer face and spaced upper and lower projections on said face formed integrally with the handle to provide a finger seat therebetween, and the upper of said projections being located at the upper end of the handle adjacent the point of contact between the handles to guard against the finger of the operator being pinched between the handles.

---

**2,769,238**
**MEANS FOR AND METHOD OF APPLYING A FILLING MATRIX TO A TOOTH**
Angus S. McPhee, Seattle, Wash., assignor of one-third to Duncan S. McPhee, Seattle, Wash., and one-third to Leonard W. Stillfant, Tacoma, Wash.
Application July 6, 1954, Serial No. 441,235
5 Claims. (Cl. 32—63)



1. A dental appliance, comprising: a plier-like tool having a pair of jaw members and handle means manually operable to open and close the jaw members, the tool having support means supporting a traveler between the jaw members inside of the area of contact of the jaws, the support means including a guide for the traveler guiding the same in movement toward and away from said area of contact of the jaws and including means manually operable to move said traveler along said guide which will hold the traveler in position when not operated, a looped band of malleable metal and the traveler having means fixedly clamping the ends of said looped band which is manually operable to clamp and release the band, the band extending from said traveler through said area of contact of the jaws and forming the loop outside thereof in which a tooth may be positioned, said jaws at the area of contact with the band being beveled so that when closed they are spaced at one side and gradually converge to meet at the other side defining a V-shaped space therebetween.

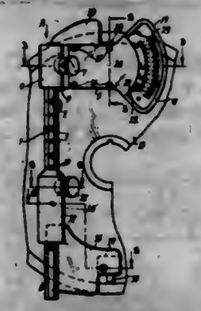
---

**2,769,239**
**OPTIONAL GUN SIGHT RETICULE ENLARGING DEVICE**
Richard L. Oswald, Los Angeles, Calif.
Application November 5, 1953, Serial No. 390,313
6 Claims. (Cl. 33—50)

1. A device for increasing the visibility of a telescopic gun sight reticule center comprising, a support for the reticule cross-strands mounted within the telescope tube, a lever pivotally mounted on the end of the support, a lever operating element mounted on the outer surface of the telescope tube, and connections between said element and the lever, said element being manually operable

to swing the lever inwardly to bring the head thereof into axial alinement with the cross-strand intersection of the reticule.

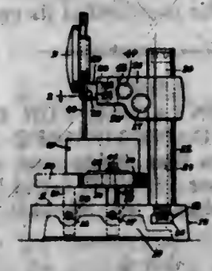
---



**2,769,240**
**MASON'S CORNER GAUGE**
Stanley V. Wells, Washington, D. C.
Application July 13, 1955, Serial No. 521,820
3 Claims. (Cl. 33—85)

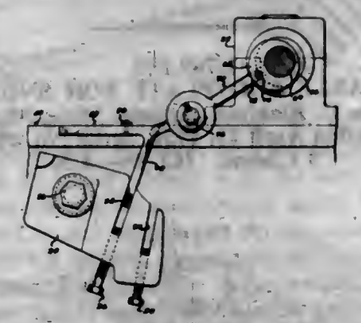
1. An adjustable supporting and tensioning device for a vertical corner gauge-line used in erecting masonry structures, said device comprising a rigid bar-shaped member having its opposite end portions offset to lie in spaced planes and its intermediate portion angularly disposed between said planes, one of said end portions forming a gauge-line supporting arm and the other forming a supporting base for said device, an elongated rod threadedly supported in and substantially normal to the plane of said gauge-line supporting arm, means for threadedly adjusting said rod relative to said arm, and means at one end of said rod for releasably attaching a gauge-line axially thereto.

---



**2,769,241**
**BRAKE DRUM GAUGES**
Harry B. Barrett, St. Louis, Mo.
Application May 22, 1953, Serial No. 356,823
3 Claims. (Cl. 33—147)

1. A brake drum gauge comprising a rod provided on one end with a slidable tubular sleeve having a laterally projecting head member which is offset rearwardly from the rod and is provided with an internal recess, a shiftable contact pin operatively mounted in the recess in laterally spaced parallel relation to the rod, means operably connected to the contact pin for rocking-movement in direct response to the shifting movement of the pin, a needle operably associated with said means, and a second tubular sleeve slidably mounted on the other end of the rod and having a laterally projecting auxiliary member which is rearwardly offset with respect to the rod, said auxiliary member having a reference member disposed in axial alignment with the contact pin, said tubular sleeves both being provided with means for locking them in fixed relative positions on the rod so that the reference member will be positioned at a predetermined distance from the contact pin.

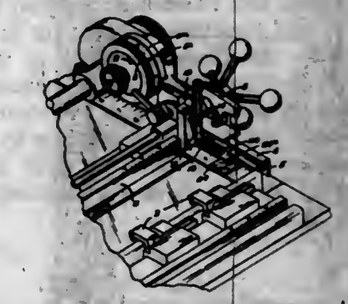


**2,769,242**
**GAUGING DEVICE**
Gottlieb Lienhard, Temple, Pa., assignor to Roco Manser Precision Engineering Corporation, Temple, Pa., a corporation of Pennsylvania
Application June 20, 1955, Serial No. 516,687
13 Claims. (Cl. 33—147)

1. A gauging device comprising a base; an upright carried by the base; means for adjustably mounting a dial indicator on the upright, to enable said indicator to be swung between two positions with its plunger extending either vertically upward or vertically downward; a table for holding a workpiece; means for adjustably mounting the table on the base below the indicator mounting means; and means for adjustably mounting the table on the upright above the indicator mounting means whereby a workpiece carried by the table may be gauged by the indicator for either position of the table.

---

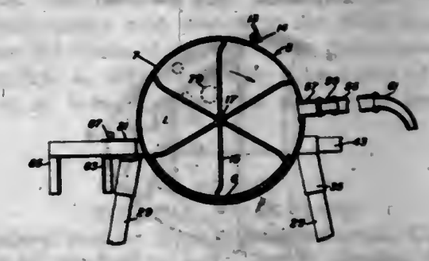
**2,769,243**
**SETTING GAUGE FOR MOTE KNIFE BRACKETS**
Charles D. Miller, Chester, S. C., assignor to The Springs Cotton Mills
Application January 11, 1954, Serial No. 403,331
6 Claims. (Cl. 33—181)



3. A gauge means for setting mote knife brackets at each frame side of a card in relation to the licker-in roll thereof, said gauge means comprising a reference shaft mountable axially in place of said licker-in roll when removed from the card, a gauge bracket having a collar portion disposed rotatably and slidably on said reference shaft and a holder portion extending radially from said shaft, and a gauge arm carried angularly by said holder portion in the relation to said reference shaft desired for a mote knife in relation to said licker-in roll, said gauge arm fitting said brackets in place of a mote knife mountable thereon for setting each of said brackets prior to mounting of the mote knife.

---

**2,769,244**
**MATCH PLATE FOR LINE-UP AND REGISTER TABLES**
George H. Charnock, Jr., Newton Center, Mass., assignor to Craftsman Line-Up Table Corporation, Waltham, Mass., a corporation of Massachusetts
Application December 29, 1954, Serial No. 478,417
6 Claims. (Cl. 33—184.5)

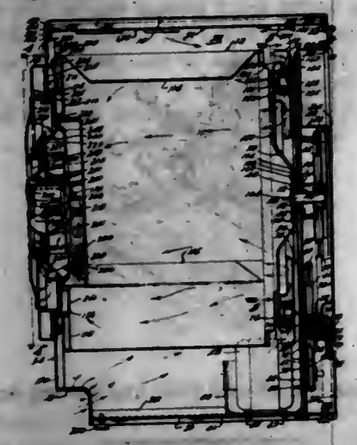


1. An improved match plate construction for use with a straight edge comprising a supporting bracket, means for adjustably securing the bracket to the straight edge, a match plate slide, means for locking the slide in a fixed position on the bracket and a match plate element

supported at one end of said slide and having an indicator line thereon.

---

**2,769,245**
**GRAIN DRIER AND CONVEYOR**
Lee E. Kechely, Phillipsburg, Kans., and Will R. Brandon, Republican City, Nebr.
Application April 13, 1954, Serial No. 422,784
1 Claim. (Cl. 34—57)

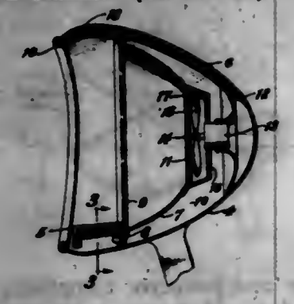


A grain drier and convcyor comprising a frame, supporting means for said frame, a circular fan casing on said frame including fixed sides and a circumferential wall and forming a drier chamber, a suction and blower fan in said chamber, a grain intake suction tube having an end opening through one side of said casing into said chamber for feeding grain into said chamber under suction created by said fan, a grain discharge blower tube having one end attached to and opening through said wall into said chamber for discharge of dried grain out of said chamber by air blast created by said fan, means for introducing heated air into said chamber to dry the grain, means mounting said wall on said sides for adjustment on said sides of the casing circumferentially of said casing to vary the distance between said ends of said tubes to vary the duration of some of the grain in said chamber, and a drive motor operatively connected to said fan, said discharge blower tube being flexible to compensate for adjustment of said wall.

---

**2,769,246**
**CLOTHES DRIER**
Robert D. Shapter, Factoryville, Pa., assignor to The Murray Corporation of America, Detroit, Mich., a corporation of Delaware
Application May 6, 1953, Serial No. 353,323
8 Claims. (Cl. 34—82)

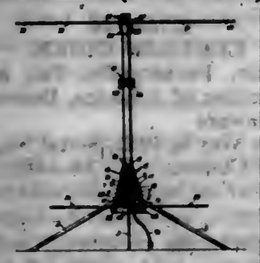
1. A clothes drier including, in combination, a casing having an air inlet, a container having front and rear walls and an imperforate peripheral wall mounted for rotation in said casing, said rear wall having apertures annularly disposed therethough, means for rotating said container, the front wall of the container and the adjacent portion of the casing having aligned access openings, a door supported on said casing closing said openings and having a passage therethrough, blower means on



said door for drawing air from the interior of said casing through the apertures in the rear wall and a removable

filter element on said door in the passage of air therethrough.

---



**2,769,247**
**HAIR DRYERS**
**Ruth F. Krueger, Granada Hills, Calif.**
**Application October 15, 1954, Serial No. 462,492**
**2 Claims. (Cl. 34—90)**

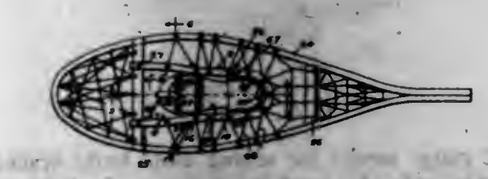
1. The combination with a hair dryer having an outer shell, an inner shell having a mouth terminating inwardly from the mouth of the outer shell and forming therebetween a jacket space, and means for circulating air within said shell jacket space, of: a foraminous member conforming in curvature to the outer shell and supported by the outer shell only in the space provided between the mouths of the shells and constructed and arranged to leave the head of the user of said dryer within the outer shell so that air circulation is not impeded within the shell.

---

**2,769,248**
**DRIER**
**William J. Ashworth, Memphis, Tenn., assignor to Mechanical Patents, Inc., Memphis, Tenn., a corporation of Tennessee**
**Application November 10, 1954, Serial No. 468,022**
**8 Claims. (Cl. 34—163)**

1. A collapsible and portable drier for clothes and the like comprising a standard, collapsible legs for supporting the standard in vertical position, a hub on the standard adjacent its lower end, a plurality of electrical resistance heating elements pivotally attached to the hub for swinging movement between an operative position extending laterally outward from the standard and a collapsed position extending upward alongside the standard, each heating element being in the form of a loop having inwardly directed end portions received in holes in the hub, and a plurality of arms carried by the standard for movement between a retracted position and a position extending laterally outward from the standard at its upper end.

---



**2,769,249**
**ROSARY WITH CONTAINER FOR CONCEALING PENDANT MEMBER**
**Rosina Anna Illes, Bridgeport, Conn.**
**Application October 15, 1953, Serial No. 386,319**
**3 Claims. (Cl. 35—23)**

1. A rosary comprising a decade portion having the ends thereof connected at spaced points to one edge of a medal, said medal comprising a hollow member having a movable closure, and a pendant portion having one end fixedly connected to said medal at a point opposite from the connection of the decade portions thereto and adapted to be enclosed in said hollow member, said medal having an opening in the edge adjacent the connection of the pendant portion through which the pendant portion can be swung in moving from within the hollow member to depending relation upon movement of the closure to open position.

---

**2,769,250**
**ADJUSTABLE FOOTPLATE FOR SNOWSHOE**
**John H. Riskinen, Atlantic Mine, Mich.**
**Application April 23, 1956, Serial No. 580,007**
**9 Claims. (Cl. 36—4.5)**

1. A footplate attachment for a snowshoe comprising, in combination with a snowshoe frame having a front cross brace, an elongated footplate attachment frame having a forward end secured to said cross brace and supported thereby in a plane substantially parallel to the plane of the snowshoe frame and extending rearwardly from said cross brace, said frame combining with the cross brace to define an elongated opening, an elongated footplate disposed in said frame opening and longitudinally thereof, a shaft extending transversely across and journalled in the said frame, said footplate being secured on said shaft for pivotal movement relative to the attachment frame about the axis of the shaft, a toeplate overlying a forward portion of said footplate, means slidably connecting the toeplate to the footplate, a toecap supported by and disposed above the forward portion of the toeplate, spring means carried by the footplate and connected to the toeplate for urging the toeplate to slide rearwardly relative to the footplate, a heel catch disposed above the other rear end of the footplate facing toward the toeplate, and means detachably mounting said heel catch on the footplate.

**2,769,251**
**ORTHOPEDIC SHOE**
**Carroll M. Elsey, Marion, Ohio, assignor of one-third to Philip W. Smith, Marion, Ohio**
**Application October 21, 1955, Serial No. 541,999**
**5 Claims. (Cl. 36—8.5)**

1. A shoe having an upper, an insole, and an outsole, said upper being marginally attached to the insole, and being marginally attached to the outsole except in the medial longitudinal arch area, whereby a pocket is formed between the insole and the outsole; and a resilient member in the pocket being secured over its entire upper surface to the adjacent overlying portions of the upper and insole; and the lower surface of the resilient member being secured to the adjacent upper surface of the outsole, this area of attachment being permitted to vary from the full lower surface of the member to only the lateral peripheral edge thereof; whereby movement of the shoe upper toward and away from the medial portion of the outsole in the longitudinal arch area is permitted.

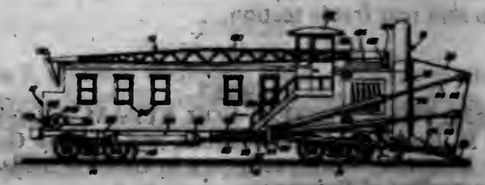
---

**2,769,252**
**SHOE CONSTRUCTION**
**Alice E. Mouler, Ypsilanti, Mich.**
**Application December 2, 1954, Serial No. 472,589**
**4 Claims. (Cl. 36—8.5)**

1. A shoe for use in exercising the muscles of the abdomen comprising an upper and a relatively rigid full sole, flat on its under surface with the heel end of said under surface cut-out for receiving an insert, a rubber-like insert secured to the sole in the cut-out, said insert having a flat surface inclined rearwardly and upwardly away from the plane containing the under surface of said sole so that no portion of said insert projects below said plane, and an elevating member secured to the underside of said sole at the forward end only thereof for maintaining the forward part of the shoe substantially higher than the rear of the shoe, said elevating member having a flat base parallel to said sole and a flat inclined portion sloping from said base upwardly to a position substantially vertically even with the front edge of said sole, said insert being inclined to said sole at the same angle that the elevating member causes the sole to be inclined to a horizontal surface on which the shoe is resting so that the flat surface of said insert will be in the plane of said horizontal surface.

---

**2,769,253**
**FOOT CORRECTIVE MEMBER**
**Hyman L. Whitman, deceased, late of East Bridgewater, Mass., by Tina I. Whitman, administratrix, East Bridgewater, Mass., assignor to The B. F. Goodrich Company, New York, N. Y., a corporation of New York**
**Application June 26, 1953, Serial No. 364,239**
**2 Claims. (Cl. 36—71)**



1. A foot-corrective member adapted to underlie the plantar surface of the foot, said foot-corrective member comprising an upwardly-extending supporting element having a flat upper face underlying the area of the plantar surface of the foot extending rearwardly to a region immediately forward of the sustentaculum tali of the foot, forwardly to a region located a distance forward of the articulation of the mesocuneiform bone of the foot with the second metatarsal bone of the foot about one-third the length of the second metatarsal bone of the foot, and transversely to regions immediately adjacent the transverse extremities of the mesocuneiform bone of the foot, said foot-corrective member having its apex at the rearmost edge of said upper face of said supporting element, said upper face of said supporting element sloping gradually downwardly as it extends forwardly from its

said rearmost edge, the upper surface of said foot-corrective member receding from said upper face of said supporting element to a marginal area of relatively thin thickness surrounding said supporting element, said foot-corrective member causing elevation of the mesocuneiform and the ectocuneiform bones and the second and third metatarsal bones of the foot to a position above that which they occupy with respect to the other bones of the foot when the bones of the foot are in their normal articulated position to allow a greater proportion of the body weight to be borne by the first metatarsal bone of the foot.

---

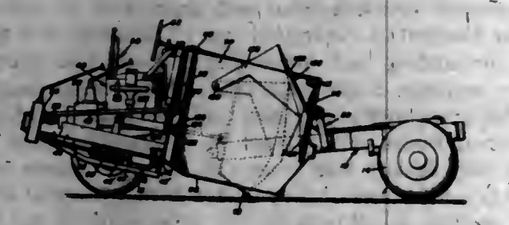
**2,769,254**
**ROTARY SNOWPLOW**
**Jacob James Wright, Regina, Saskatchewan, Canada, assignor of one-half to J. D. Aaron, Regina, Saskatchewan, Canada**
**Application July 8, 1952, Serial No. 297,612**
**1 Claim. (Cl. 37—21)**

A rotary snowplow comprising a vehicle having mounted at the forward end thereof snow removal means, mechanism carried by said vehicle for actuating said snow removal means, said vehicle being adapted to be motivated by a conventional pusher vehicle, the pusher vehicle providing energy for operating said mechanism, said snow removal means including a rotary head mounted in a cowl, wings hingedly connected to sides of said cowl for urging the entrance of snow into contact with said rotary head in response to forward movement of said vehicle, said wings being positionable by a plunger carried by the under portion of said vehicle, said plunger being connected to a crosshead, each wing being connected to an associated end of the crosshead by a plurality of struts, said struts being in the form of pressure transmitting elements automatically adjustable in length.

---

**2,769,255**
**SNOW THROWER**
**Theodore E. Mead, Wilmette, Ill.**
**Application July 2, 1953, Serial No. 365,689**
**5 Claims. (Cl. 37—43)**

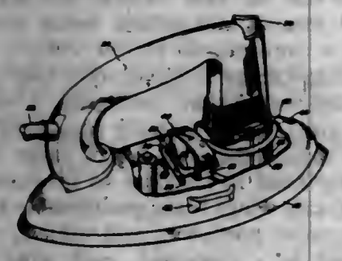
1. A thrower device, comprising a pair of spaced wheels equipped with antifriction bearings, a shaft journaled in said bearings, a worm fixed upon said shaft, a



shield suspended upon said shaft and having its forward lower edge at the rear of said shaft, and power means for

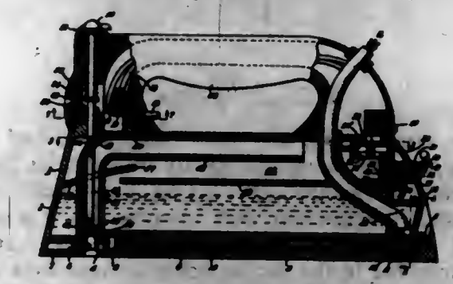
rotating said shaft, said shield being pivotal about the longitudinal axis of said shaft.

---



**2,769,256**
**TRUCK SCRAPER**
**John Ose, Granite Falls, Minn.**
**Application November 6, 1953, Serial No. 390,483**
**3 Claims. (Cl. 37—126)**

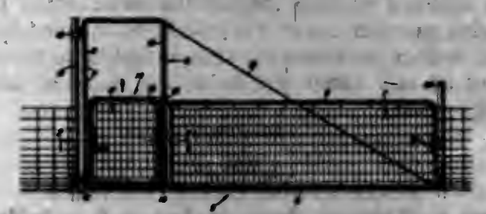
1. An earth mover comprising a front and a rear section, a front and a rear wheel assembly supporting respectively said front and rear sections, a bowl secured to the forward part of said rear section, said bowl being open at its lower forward portion, a door pivoted within the bowl and movable to a position for closing the bowl opening, said front and rear frame sections being articulately connected, jack means secured on the front section for raising and lowering said bowl, and means for moving said rear wheel assembly to selected longitiudinal positions on said rear frame section.



---

**2,769,257**
**BREATHER SYSTEM FOR STEAM IRONS**
**Robert H. Duncanson, Minneapolis, and William G. Roll, New Brighton, Minn., assignors to General Mills, Inc., a corporation of Delaware**
**Application August 19, 1954, Serial No. 451,008**
**4 Claims. (Cl. 38—77)**

1. A steam iron comprising a soleplate, a steam generating chamber associated with said soleplate, a reservoir surmounting the soleplate for containing liquid to be fed to said steam generating chamber, and a breather system including means forming a first passage having an open end disposed adjacent a first side of the reservoir and extending to a point adjacent a second side lying opposite said first side, a second passage having an open end disposed adjacent said second side and extending to a point adjacent said first side, and a third passage connecting said first and second passages with atmosphere.



**2,769,258**
**STEAM IRONS**
**Albert C. Hoecker, St. Louis, Mo., assignor, by mesne assignments, to General Electric Company, New York, N. Y., a corporation of New York**
**Application August 31, 1949, Serial No. 113,386**
**4 Claims. (Cl. 38—77)**

1. A dampening iron comprising a pressing surface and a boiler for the reception of steam and water, said boiler having a steam space and a water space, a hollow member communicating with the steam space in said boiler and having its outlet directed towards the work being ironed, said outlet having a valve seat for the reception of a control valve, said valve having a minute opening of less diameter than said outlet, said opening extending longitudinally of the valve with its inlet above the valve seat and its outlet positioned within the valve opening, so that when the valve is seated in said valve seat the steam pressure in said boiler will be greater than when the valve is lifted off its seat, so that low pressure steam may be directed to the material being ironed when the valve is lifted off its seat for steaming the material being ironed, a water inlet communicating with said hollow member adapted to allow a predetermined amount of water into said hollow member to mix the water with the steam, to provide saturated steam in said hollow member, said water inlet extending above the water line in said boiler and up in said steam space so that water will not enter said hollow member when the iron is on even keel as while ironing but water will enter said hollow member through said water inlet when the iron is lifted off the material being ironed and the toe of the iron turned downwardly for dampening the material being ironed, said valve to be seated when dampening the material and said minute opening in said valve being restricted to retain sufficient steam pressure in said boiler to atomize the saturated steam passing through said minute opening, when the valve is seated.

---

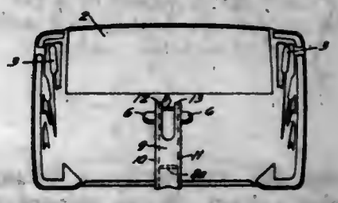
**2,769,259**
**FARM GATE**
**Arthur O. Gunderson, Gifford, Iowa**
**Application January 17, 1955, Serial No. 482,179**
**2 Claims. (Cl. 39—75)**

1. A multiple closure adapted to be mounted between a first and a second post, said closure comprising a horizontally elongated rectangular frame having upper and lower side members and an end member which is parallel to said first post, a latch for said closure arranged operatively between said end member and said first post, said lower side member being longer than said upper side member and thereby having a part which extends

beyond said upper side member, an auxiliary frame connected with said rectangular frame and comprising a first upright secured to the extremity of said part of said lower side member, a second tubular upright parallel thereto and secured to said part of said lower side member and said upper side member, both of said uprights rising above said upper side member, means interconnecting the upper ends of said uprights, hinges connecting said first upright to said second post and thereby mounting the entire closure for swinging movement, said first upright having a plurality of spaced openings, an auxiliary gate disposed between said uprights, means carried by said auxiliary gate and engageable in one of said openings to hold said auxiliary gate in the closed position and engageable in the other of said openings to hold said auxiliary gate in selected raised positions, and a pair of collars secured to said auxiliary gate both slidably and rotatively mounting said auxiliary gate on said second tubular upright.

---

**2,769,260**
**NOVELTY TELEVISION LAMP**
**Louis W. Fenwick, Santa Monica, Calif.**
**Application July 3, 1953, Serial No. 366,083**
**1 Claim. (Cl. 40—77)**



A novelty lamp comprising a cabinet of rectangular shape and having a back wall provided with a light emitting opening and a front wall provided with an opening in the upper portion thereof, a screen of translucent material disposed in the front wall opening and having opening means therein, at least one manually rotatable shaft extending through and disposed substantially perpendicular to said front wall, means mounting said shaft on the cabinet, a knob secured to said shaft at the outer side of said front wall, a disc of translucent material mounted at the rear side of said screen for rotation respectively by said shaft and having a circular series of indications thereon selectively registerable by rotation of said shaft with said opening means in said screen, a lamp bulb socket mounted in the lower portion of said cabinet, a lamp bulb mounted in said socket, and a reflector extending from below said lamp bulb between said lamp bulb and said front wall and to the upper edge of the light emitting opening in said back wall and having an opening therein dimensioned to confine light from said lamp bulb to said screen.

---

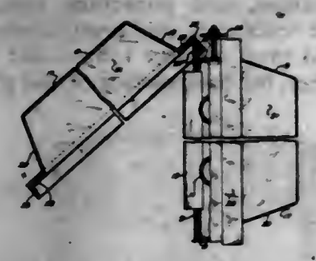
**2,769,261**
**CALENDAR STAND**
**Clayton A. Laughlin, Minneapolis, Minn., assignor to Northwest Plastics, Inc., St. Paul, Minn., a corporation of Minnesota**
**Application January 20, 1954, Serial No. 405,089**
**1 Claim. (Cl. 40—120)**

A desk calendar stand, including a rigid, planar member and a prop member, said rigid, planar member having a front surface and a back surface, said front surface being adapted to carry a calendar pad, said back surface being provided with a pair of horizontally aligned, spaced apart protuberances, the opposed faces of said protuberances being formed with recesses therein, one end of said prop member being divided into two forks, said forks being flexible toward each other, the outer side edge of one of said forks being provided with a projection, the outer side edge of the other of said forks being provided with a similar, opposed projection, the width of said forked end of said prop member, taken through said projections, being greater than the distance between the opposed faces of said protuberances, said projections being pivotally carried within the recesses of said protuberances to allow movement of said prop member toward and away from said planar member, the back surface of said planar mem-

ber being formed with a rib projecting therefrom, the plane surface of said rib lying horizontally of said planar member, said rib being positioned so as to lie between the inner side edges of said forks when said prop member is in position away from said planar member, the end edges of said rib then butting against the inner side edges of said forks, said rib thereby precluding flexing of said forks toward each other when said prop is in position to hold said planar member in upright position, a corner edge of each of said forks being beveled to provide for clearance of said fork members over said rib when said prop member is moved to position adjacent said planar member, whereby said forks may be flexed toward each other to disengage said projections from said recesses when said prop member lies substantially flat against said planar member.

---

**2,769,262**
**DISPLAY STANDS**
**Melvin J. Gordon, Wellesley, Mass., assignor to Melvin J. Gordon, Sadye Z. Gordon and Natalie G. Stone, doing business as Manchester Hosiery Mills, Manchester, N. H.**
**Application November 18, 1952, Serial No. 321,171**
**5 Claims. (Cl. 40—126)**



1. An illuminated display form for hosiery comprising a translucent hollow leg form, means supporting the leg form in the foot area, a disk tightly fitting across the inner wall of the leg form in the ankle region, means positioned within the hollow leg form providing a mask resting on the disk surrounding a small area above the ankle region,

an electric light source secured in the hollow form within the mask and an electric cord extending through the form adjacent the support in the foot area.

---

**2,769,263**
**ILLUMINATED SIGNS**
**Carl H. Wanner, Milwaukee, Wis., assignor to Everbrite Electric Signs, Inc., Milwaukee, Wis., a corporation of Wisconsin**
Application March 30, 1954, Serial No. 419,710
4 Claims. (Cl. 40—132)

1. In a display sign construction, a rectangular metallic frame forming a drum, the top element of said drum frame having an upwardly projecting flange, a pan-like member for closing a face of said drum frame, said pan-like facing member including a dished sheet of translucent material with a rectangular flanged peripheral portion and metallic collar members carried by the flanged peripheral portion of the sheet material, the collar member along the top edge of the sheet material flange being angled and hookingly engaging the upwardly projecting flange of the top element of the drum frame to provide for hinging movement of the pan-like facing member on the drum, and a plate supported from the top element of said drum frame spacedly over the collar member along the top edge of the sheet material flange to prevent displacement of the latter during hinging movement of said pan-like member.

---

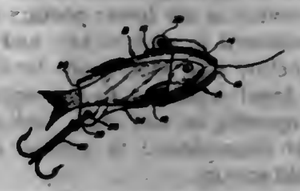
**2,769,264**
**PENDANT VIBRATORY DISPLAY DEVICE**
**Walter P. Niblick, Cincinnati, Ohio**
Application September 24, 1953, Serial No. 382,129
14 Claims. (Cl. 46—139)

1. In a device of the class described, resilient suspension means, a vibration generating device suspended thereby, an elongated vibration transmitting element operatively connected to said generating device and depending therefrom, a pair of arms asymmetrically secured to the lower end of said transmitting element, a bracket of U-shaped cross section secured to each of said arms, each said bracket having a lining of material having a unidirectional nap, the lining in said brackets being disposed with the nap extending in the same direction, and a relatively thin annulus supported in said brackets in contact with said lining, whereby upon operation of said vibration generating device, said annulus is caused to revolve.

**2,769,265**
**METAL FOIL APPLIQUES AND METHOD OF MAKING SAME**
**Robert Nelson Page, Seattle, Wash., assignor to Boeing Airplane Company, a corporation of Delaware**
No Drawing. Application June 18, 1947
Serial No. 755,493
9 Claims. (Cl. 41—26)

1. A labelled article bearing a metal applique comprising a piece of aluminum base foil having an aluminum oxide layer on a side thereof and of a thickness, including said aluminum oxide layer, of about .003 inch, bonded to said article sufficiently strongly with respect to the fragility of said foil to prevent said applique being peeled off the article without tearing of the applique, dye impregnating said oxide layer over a portion of the area of such side, and the remainder of such side being of color contrasting with said dye.

---

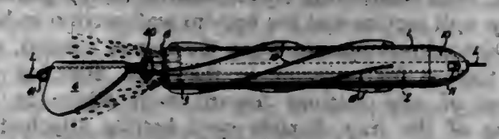


**2,769,266**
**RELIGIOUS SYMBOL**
**Robert S. Feeley, Carmel, N. Y.**
Application April 29, 1954, Serial No. 426,510
3 Claims. (Cl. 41—34)

1. A religious symbol especially adapted as a guide to prayer comprising a base plate having a front face provided with a recessed portion of a configuration corresponding to that of the cross, a crucifix positioned on the front face of the base plate and comprising a cross with a symbol of Christ thereon and removably positioned in said recessed portion, representations of the respective fourteen stations of the cross positioned about the crucifix and secured to the front face of the base plate and spaced protrusions positioned along the edges of the cross at points adjacent to and corresponding to the positions of the respective stations of the cross and identifiable by touch.

---

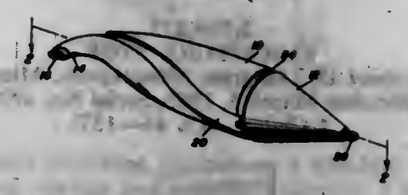
**2,769,267**
**TRANSPARENT FISH LURE**
**Clifford V. Ansley, Syracuse, N. Y.**
Application March 21, 1952, Serial No. 277,868
1 Claim. (Cl. 43—41)



A fish lure comprising a hollow body including a first section of resilient material having openings provided in both ends with the forward end opening smaller than the rearward end opening, the first section being further provided with an aperture in the surface thereof intermediate the openings adapted to receive a fish line, and slotted extensions integrally connected to and extending rearwardly from the first section, a second section of resilient material having openings in both ends with the forward opening thereof being larger than the rearward

opening thereof and of the same order as the rearward opening in the first section, an apertured vertical lug on the surface of the second section adjacent the forward opening of said second section for attachment thereto of a fish line, a protuberance on the surface of the second section, said second section being provided with recesses communicating with the forward opening thereof, said sections being adapted to be assembled in axial register with the edge of the rearward opening in the first section contiguous to and abutting the edge of the forward opening in the second section, portions of the edge of the rearward opening of said first section together with the edges of said recesses defining apertures in the walls of said hollow body communicating with the interior thereof.

---

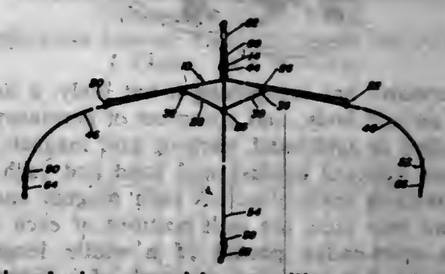


**2,769,268**
**FISH LURES**
**Myron C. Miller, Seattle, Wash., assignor to Herring Magic, Inc., Seattle, Wash., a corporation of Washington**
Application May 17, 1954, Serial No. 430,320
4 Claims. (Cl. 43—42.06)

1. A fish lure, for dispensing a trail of scales, comprising an elongated hollow container having water inlet apertures at its front end and exit apertures at its rear end, a spindle disposed axially within the container about which the container may revolve, water-reaction vanes on the exterior of said container to effect its revolution when drawn through the water, means to support the container from a line for drawing it through the water for entrance of water through its front end apertures and for exit of the water and scales from within the container through its rear end apertures, and generally radially directed stirrer arms on the spindle, within the container and adjacent the rear end apertures.

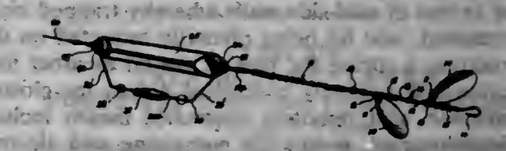
---

**2,769,269**
**FISH LURE**
**Rex K. Martin and John S. Bartlett, Ovid, Mich.**
Application June 28, 1954, Serial No. 439,572
1 Claim. (Cl. 43—42.46)



A self-rotating fish lure which has a spinning as well as a wobbly motion when drawn through a body of water comprising, in combination, an elongated rearwardly tapering body including a substantially flat anterior end, a posterior end appreciably reduced in cross-section and gradually and laterally curved relative to the longitudinal axis of said body, said body being circular in cross-section from end to end and having a spiral water channeling groove formed in its peripheral surface extending lengthwise from the anterior end to and opening through the posterior end of said body, a substantially conical head detachably mounted on the anterior end of said body, said body being beveled at the periphery of the flat anterior end, said head including a generally flat base and being beveled at the periphery of said base, said bevels being aligned, united and cooperating and thus providing an endless annular V-shaped groove at the junction of said body and said head, respectively, said body having an axially positioned substantially rectangular socket in the central portion of said anterior end, the base of said head having a corresponding axially disposed rectangular extension constituting a key and telescoping into and being thus removably keyed in said socket, said body also having a transverse bore extending through said socket with one end terminating in said groove, said extension having a bore aligned with the bore in said body, and a readily insertable and removable assembling and retaining pin extending through the aligned bores and thus detachably connecting said head to said body.

---



**2,769,270**
**SPREADER FOR FISHHOOKS**
**Ivy L. Williams, Ty Ty, Ga.**
Application July 16, 1954, Serial No. 443,914
1 Claim. (Cl. 43—42.74)

A fishing device comprising a resilient spreader member, an eye formed substantially centrally of said spreader member, said spreader member including arms diverging from said eye, and eyes disposed adjacent the outer ends of said diverging arms, a guide loop on each arm and disposed intermediate the end eye and said central eye, a leader including a substantially centrally disposed eye, and having portions on opposite sides of said central eye extending along the arms of said spreader member and extending through the respective guide loops and end eyes of said spreader member, said portions terminating in means adapted for connection thereto of fish hooks the central eyes of said spreader member and said leader being positionable in overlying relation and adapted for connection to a fish line, an angulated resilient brace connected between the guide loops and the divergent arms, said brace having a guide loop disposed substantially centrally thereof in substantially vertical alignment with said central eye, a leader extending through the guide loop of said brace, said last mentioned leader having an eye positionable adjacent said central eyes adapted to be connected to said fish line.

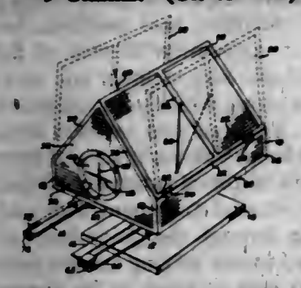
---

**2,769,271**
**COMBINED ANTI-TWIST RUDDER AND FLOAT FOR USE WITH FISHING LURES**
**Eric M. Smith, Seattle, Wash.**
Application February 8, 1954, Serial No. 408,709
6 Claims. (Cl. 43—43.13)

6. In combination, a fish line, a fish lure of spinner type, and a combined anti-twist float and keel joining said line and lure; said float comprising an elongated, buoyant body, formed with an eyelet in its forward end portion through which a line connector is applied, and with an eyelet in its rearward end through which a lure connector is applied, and a keel secured to the float and substantially spaced therefrom; said keel comprising a base portion extending parallel with the float, and having upwardly directed legs at its ends affixed at their ends

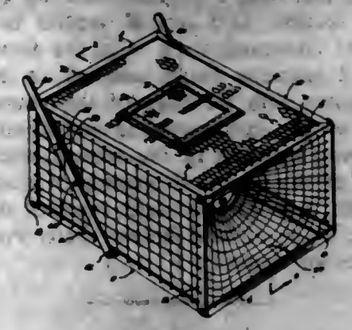
to the opposite end portions of the float, a weight applied to the said base member to establish a moment of resistance to rotation of the lure as drawn through the water and said weight being of sufficient size to control the depth of the float in the water.

---



2,769,272
FISHERMAN'S HAT
Louis Goldman, Framingham, Mass., assignor to Bancroft Cap Company, Framingham, Mass., a corporation of Massachusetts
Application September 8, 1953, Serial No. 378,954
1 Claim. (Cl. 43—57.5)

A fisherman's hat comprising a hat body, a hat band mounted on said body, and a number of permanent magnets attached to said band, each of said magnets having a rear face disposed against said band and each having a slot extending entirely across each magnet and opening on said rear face, the wall portions of each slot defining an open-ended pocket of a width, length, and depth suitable for receiving the barb of a fishhook for enclosing the same between the magnet and said hat band, and each magnet being separately attached to said hat band.



---

2,769,273
TRAP
Raymond F. Martin, Fairborn, Ohio
Application February 28, 1952, Serial No. 273,789
9 Claims. (Cl. 43—61)

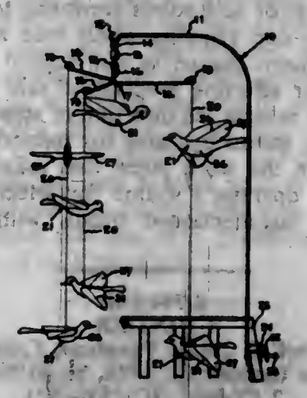
1. A remotely controlled trap including a base, a U-shaped standard mounted on said base, the upper ends of the legs of the U-shaped standard terminating in reentrant flanges, a frame structure mounted upon the reentrant flanges, said frame structure including a pair of angle irons, a floor mounted upon the angle irons, side and end walls projecting upwardly from the floor, and a lid for covering the top of the side and end walls, means positioned in one of said side walls whereby trapped birds may be removed, said lid being pivotally mounted on the frame structure, a spring for biasing the lid member into open position and remotely controlled means for closing the lid member, said remotely controlled means including an electromagnet, means for energizing said electromagnet, a movably mounted bar, a spring for urging said movably mounted bar in one direction, means for locking the movably mounted bar with the spring in tension, connecting means for connecting the locking means and the electromagnet so that as the electromagnet is energized the locking means releases the movably mounted bar, and means for connecting the movably mounted bar to the lid so that the spring of the movably mounted bar closes the lid against the force of the spring holding the lid open.

2,769,274
CRAB TRAPS
Nels Martin Ouglund, Bellingham, Wash.
Application February 4, 1952, Serial No. 269,697
1 Claim. (Cl. 43—105)

A crab trap of rectangular box-like form comprising a top wall section having oppositely disposed side rails and oppositely disposed end rails defining said top wall, a bottom wall section having oppositely disposed side rails and oppositely disposed end rails defining said bottom wall, links connecting corresponding corner portions of the top wall section and the bottom wall section to hold them in spaced relationship when the trap is erected, and pivoted thereto for swinging in the same direction for movement of said sections toward each other for the collapsing of the trap, flexible cord netting attached to the side rails of the top and bottom sections and to the links to form the side walls of the trap, woven cord tunnels applied to the opposite ends of the trap, each tunnel having its larger end attached to the links and end rails of the top and bottom sections at the corresponding end of the trap, thus to partially close the ends of the trap, said tunnels terminating in spaced relationship at their inner ends, and each having a rigid ring defining the open inner end of said tunnel, coiled springs extended between and attached under tension to said rings to draw the tunnels taut and retain them open when the trap is erected, and diagonally directed toggle linkage joining the side rails of top and bottom wall sections and adapted, in one position of adjustment to retain the trap in its erected position and manually movable to another position of adjustment to cause the trap to be collapsed; and one link of said toggle linkage being extended as an actuating handle for the adjustment of the linkage from one position to another.

---

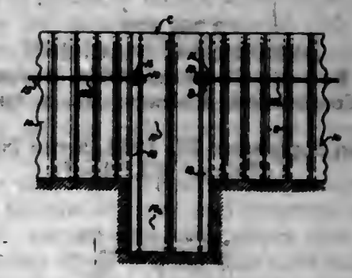
2,769,275
FURNITURE STOP
Robert D. Lindgren, Minneapolis, Minn.
Application March 3, 1955, Serial No. 492,011
1 Claim. (Cl. 45—137)



A furniture stop comprising an L-shaped bracket consisting of a normally generally horizontal flange portion and a normally generally vertical flange portion, said bracket being adapted to be rigidly detachably secured to the frame of a seat-forming piece of furniture with said generally vertical flange portion engaging the laterally outwardly facing back-side of said frame and said generally horizontally disposed flange portion engaging the underside of said frame, a pair of oppositely disposed spaced parallel ears rigidly anchored to said horizontal flange in depending relationship and disposed in laterally

inwardly spaced relationship with said vertical flange each disposed in a plane generally normal to said vertical flange, an expandable and contractible longitudinally extending arm comprising telescoping front and rear sections, means for adjustably securing said sections together, the forward end of the front section of said arm being disposed between said ears, means pivotally anchoring the forward end of the front section of said arm to said ears for pivotal swinging movements of said arm about a generally horizontal axis parallel to said vertical flange portion through an angle of approximately 180° wherein said arm is pivotally swingable from a generally horizontal position extending in one direction to a generally horizontal position extending in the opposite direction, said arm being pivotally swingable between an elevated rearwardly extending cleanup position and a rearwardly and downwardly extending operative position and a generally horizontally disposed forwardly extending storage position, said arm at its forwardly extending storage position being adapted to be disposed beneath said furniture laterally inwardly of the back thereof whereby to be attached to said piece of furniture and maintained ready for immediate use but disposed completely unobtrusively and without detracting from the original appearance of the piece of furniture, and a laterally inwardly projecting nub formed in one of said ears and adapted to engage said arm adjacent its pivotal connection to said ears for releasably holding said arm at its cleanup position and at its storage position until released.

---

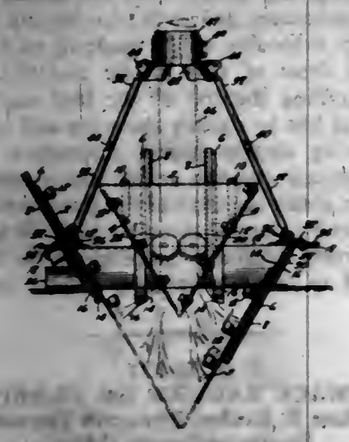


2,769,276
INFANT'S PLAYTHING
Robert L. Steiner, Cincinnati, Ohio, assignor to The Bromo-Mint Company, a corporation of Ohio
Application October 19, 1953, Serial No. 386,764
1 Claim. (Cl. 46—32)

An infant's plaything comprising a standard including a horizontal portion and a vertical portion, a bracket at the lower end of said vertical portion adapted to be secured to the top rail of an infant's crib or the like, said vertical portion being substantially long whereby the horizontal portion overhangs the crib at a substantial height above an infant in the crib, a spider having a plurality of horizontal arms, means to freely rotatably suspend said spider from the outer end of said horizontal portion of the standard, a thread secured to the outer end of each arm of the spider and hanging freely therefrom, an additional thread secured to the center of the spider below the suspension means thereof and hanging freely therefrom, a plurality of light-weight, artificial birds, one of said birds being fastened to the thread hanging from the center of said spider, at least two artificial birds fastened onto each of the other threads, the birds being disposed at different elevations on the respective threads, each thread extending downwardly through the center of gravity of the birds upon it and the birds being distributed on the respective threads hanging from the arms of the spider such that the spider is in horizontal balance on the suspension means, and each bird having substantially large laterally extending wings made in each instance of a continuous sheet of thin plastic material, the plastic material straddling the top of the bird and being bent along a lateral line to rigidify the wing and to provide an airfoil-like wing section highly responsive to air currents, whereby air currents cause movements of the individual birds about the axes of the threads to which they are fastened and cause the assembly of birds to turn about the means freely rotatably suspending the spider from said standard to create a moving display interesting to infants.

---

2,769,277
TERRACE BARRIER OR CURBING
William B. Keelor, Plymouth Township, Hennepin County, Minn.
Application January 15, 1953, Serial No. 331,450
1 Claim. (Cl. 47—33)



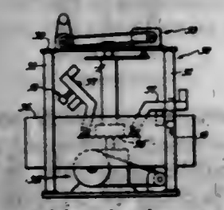
In a terrace barrier, transversely bowed barrier bands of sheet metal transversely corrugated and arranged edgewise upright in endwise succession, in scalloped fashion, the adjacent end portions of adjacent bands converging and terminating short of each other with their ends in relatively spaced relation, a coupling post in the form of a panel of sheet metal spanning the space between adjacent ends of adjacent barrier bands, the upright edge portion of the post at either side thereof having a vertically extending corrugation therein overlapped by and nesting in the terminal corrugation of its respective barrier band, fastening means securing such bands to the post at the nested overlaps between bands and post, said post having a pair of apertures therein, one at either side of the post adjacent to the corrugation therein, a trussing member of wire for each such band, the same extending along the outer convex face of its respective band and having a terminal portion extending through its corresponding aperture in the post, the ends of said terminal portions of said trussing members having a tensioning twist therebetween located at the inner side of the post, said tensioning twist uniting the said terminal portions of said trussing members at said inner side of said post.

---

2,769,278
TREE BALLING DEVICE
Frank Lloyd Wassell and George W. Wassell, Westport, Conn.
Application May 16, 1952, Serial No. 288,176
10 Claims. (Cl. 47—37)

1. An excavating device comprising a plurality of plates adapted to be driven into the earth at angles to the vertical to meet at a common point below the surface of the earth, and means for locking said plates together including cooperative, separable locking means carried by adjacent portions of adjacent plates and adapted to be driven with said plates to points below the surface of the earth before being joined, the cooperative locking means of adjacent plates being offset along a vertical axis

to permit successive plates to be driven into the earth without interference by the locking means, said cooperative locking means coming into alignment when the plates meet at said common point.



---

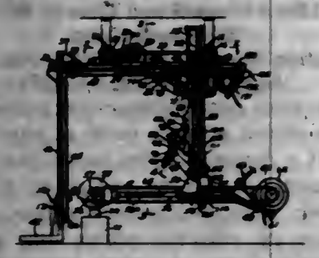
2,769,279

## DEBURRING MACHINE

Kenneth J. Powers, Cleveland, Ohio, assignor to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois

Application September 27, 1954, Serial No. 458,530
4 Claims. (Cl. 51—7)

1. A deburring machine having a carriage rotatably mounted about a vertical axis with a plurality of spindle units hingedly attached thereto for raising and lowering a work piece while spinning into and out of a liquid mass of abrasive material, a spindle chuck assembly for each spindle unit including a substantially cylindrical spindle sleeve means, a draw bar received in said spindle sleeve means and actuated by said spindle unit, and a work holder head means adapted to receive a work piece when said draw bar is in one position and to chuck said work piece by cooperation between said spindle sleeve means and said work holder head means when said draw bar is in a second postion.



---

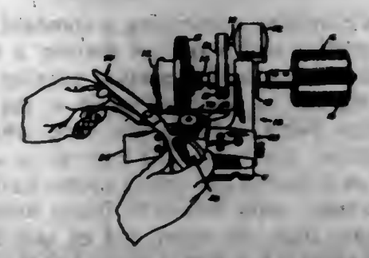
2,769,280

## GRINDING APPARATUS, PARTICULARLY FOR GRINDING BILLETS AND THE LIKE

George E. Comstock, 3d, Holden, Mass., assignor to Norton Company, Worcester, Mass., a corporation of Massachusetts

Application July 22, 1953, Serial No. 369,616
27 Claims. (Cl. 51—34)

1. In grinding apparatus, in combination, means forming a support for a long work-piece such as a billet, overhead guide rails extending lengthwise of the support, a carriage adapted to travel therealong with reversible motor means therefor and a variable resistance device responsive to carirage travel to measure the latter, said carriage having an operator's station depending therefrom and in front of the work-piece support and having movably depending therefrom, to the rear of said support, a frame for movement toward and away from the operator's station with reversible drive means for so moving it and with a variable resistance device responsive to its movement to measure the latter, said frame supporting a sub-assembly comprising a driven grinding wheel overlying said work-support and movable relative thereto, variable resistance means at said operator's station with two manual controls therefor and having circuit-connections to said first variable resistance and forming therewith a multiple electrical bridge having two balance points settable by said two manual controls with means responsive to electrical change in relation to either of said points according to the direction of carriage travel and resultant change thereby in said first resistance device for effecting reversal of said carriage-driving motor means whereby said carriage with the grinding wheel and operator's station travels along said overhead rails lengthwise of the work-piece in reversing grinding traverses relative to the workpiece that are of a length as determined by the setting of said two manual controls, means adapted to operate in timed relation to said reversing grinding traverses for actuating said frame-moving reversible drive means unidirectionally in successive relatively small increments to thereby give the grinding wheel step-by-step feed in direction from one longitudinal edge of the work-piece to the other, a second variable resistance means at said operator's station with two hand controls therefor and having circuit-connections to said second variable resistance device and forming therewith a multiple electrical bridge having two balance points settable by said hand controls, control means operating in response to electrical changes in the second bridge relative to either of said points according to the direction of said step-by-step grinding wheel feed movement and resultant resistance change in said second resistance device, means for effecting reversal of said frame-moving drive means to reverse the direction of step-by-step grinding wheel feed, means operable for retracting said grinding wheel from the work piece, and manually operable means at said operator's station for selectively associating said two last-mentioned means with said control means.



---

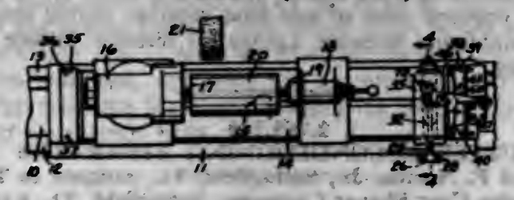
2,769,281

## GRINDER

Cecil B. Jones, Pasadena, Calif.

Application October 11, 1954, Serial No. 461,487
2 Claims. (Cl. 51—91)

1. In a grinder having a rotary grinding wheel journaled in a stationary base, means for grinding pinking shears across the surface of said grinding wheel comprising a track with a pair of curved concentric edges, a link pivotally mounted to the base, and the track being pivotally mounted to the link, whereby the track's bevel angle and distance from the grinding wheel can be independently adjusted, a carriage mounted on said track, arms on said carriage for engaging with the curved concentric edges of the track, said arms being spaced by a distance greater than the spacing of the curved edges from each other, whereby the carriage can be made both to slide along the track and to yaw on said track, means for holding a blade to be sharpened to the carriage, whereby a blade held to the carriage is moved across the grinding wheel at a bevel and distance relative thereto which is determined by the setting of the track and by movement of the carriage along the track, and in which a forked guard is provided comprising a body and two spaced tines projecting from said body, said body being flexibly mounted to the base, and the tines straddling the grinding wheel, whereby the radial placement of the tines relative to the grinding wheel may be varied so as to limit the impingement of the blade being ground against the grinding wheel.



---

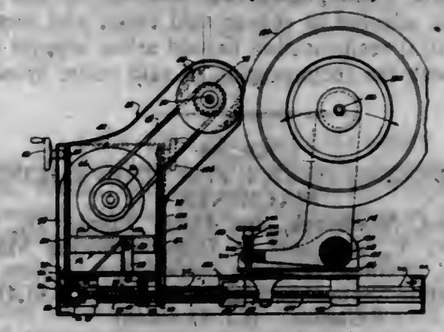
2,769,282

## GRINDING MACHINE-TAPER CONTROL

Wallace H. Wood, Worcester, Mass., assignor to Norton Company, Worcester, Mass., a corporation of Massachusetts

Application June 20, 1955, Serial No. 516,681
7 Claims. (Cl. 51—95)

1. In a machine tool having a base, a longitudinally movable table thereon, a swivel table on said longitudinally movable table, a fixed pivot stud which mates with an aperture in said swivel table, means including a nut and screw mechanism spaced from said pivot stud operatively connected to effect a swivelling adjustment of said swivel table, and a sine-bar attachment including a bracket adjustably clamped on said swivel table, a rock arm pivotally mounted on said bracket, a dial indicator adjustably mounted on said bracket having its actuating plunger arranged to engage one end of said rock arm, a vertical pin on the other end of said rock arm, a fixed locating surface which is engaged by said pin, and means precisely to position said bracket relative to said swivel table when said pin is in engagement with said surface to facilitate locating said pin in a predetermined distance from the axis of said pivot stud.



---

2,769,283

## ABRADING MACHINE FOR TIRE TREAD SURFACES

Charles R. Brown, Santa Cruz, Calif.

Application April 13, 1954, Serial No. 422,828
2 Claims. (Cl. 51—97)

1. An abrading machine for tire tread surfaces comprising a horizontally disposed elongated base, having parallel upstanding side walls and parallel upstanding end walls extending between said side walls at opposite ends thereof, a pair of guide rails arranged in parallel relation longitudinally of said base between said side walls and secured at opposite ends to said end walls, transversely spaced pairs of longitudinally spaced bearings defining a carriage with one pair of said bearings slidable on one of said rails and the other pair of said bearing slidable upon the other of said rails, an upstanding support structure carried on said carriage for movement therewith longitudinally of said base from adjacent one end of said base toward and away from the other thereof, an abrading wheel rotatably mounted on said structure, other transversely spaced pairs of longitudinally spaced bearings defining another carriage with one pair of said other pairs of bearings slidably mounted on said one rail and the other pair of said another pair of bearings slidable on the other of said rails longitudinally thereof, a support plate carried by said another carriage in spaced relation to said structure for movement in a rectilinear path longitudinally of the base, a platform carried by said plate for movement in an arcuate horizontal path above and parallel to said plate, a standard carried by said platform for movement in a vertical arcuate path about a horizontal axis, means on said standard adapted to rotatably mount a tire thereon, a first adjusting screw journaled at its opposite ends in said end walls to extend longitudinally in said base and operatively connected to said structure and upon rotation of said screw causing movement of said structure longitudinally of said base on said rails toward and away from said standard, means carried by said structure and operatively connected to said adjusting screw for selectively imparting rotation thereto whereby said structure can be selectively moved toward and away from said standard, a second adjusting screw journaled in said base to extend longitudinally thereof and operatively connected to said support plate and upon rotation of said second adjusting screw causing movement of said structure longitudinally nally of said rails, means on said structure operatively connected to said second adjusting screw for selectively imparting rotation thereto whereby said standard can be selectively moved toward and away from said structure.

2,769,284

## COATED ABRASIVE WHEEL MANUFACTURE

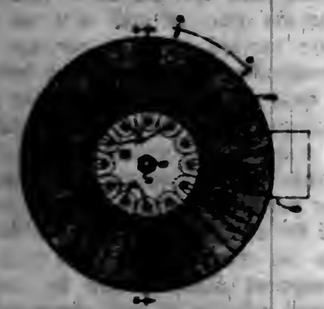
Joseph K. McLaughlin, Latham Heights, and Nicholas E. Oglesby, Troy, N. Y., assignors to Norton Company, Troy, N. Y., a corporation of Massachusetts

Application April 25, 1956, Serial No. 580,590
Claims priority, application Canada May 20, 1955
11 Claims. (Cl. 51—193.5)

1. A coated abrasive wheel element comprising a woven backing member bearing on at least one side thereof a layer of abrasive grain adhesively secured to the backing member, the threads comprising said woven backing member being so disposed and arranged that when said element is positioned in a coated abrasive wheel a plurality of said threads extend at an angle greater than 0° and less than about 30° to the axis of rotation of said wheel.

---

2,769,285



## ABRASIVE POLISHING WHEEL AND ELEMENT

Fritz E. Hendrickson, South Elgin, Ill., assignor to Norton Company, Troy, N. Y., a corporation of Massachusetts

Application October 26, 1953, Serial No. 388,308
4 Claims. (Cl. 51—193.5)

1. A coated abrasive element adapted for use in an abrasive wheel which comprises: a flexible backing mem-

ber; an abrasive coating bonded to and substantially uniformly covering at least one side of said backing member; and a plurality of relatively rigid pleats in said backing member, said pleats at least partially overlapping

one another and having the outer edges only thereof adapted to be bent angularly with respect to the pleat to provide a plurality of narrow abrading surfaces when said element is positioned in an abrasive wheel and contacts a work piece.

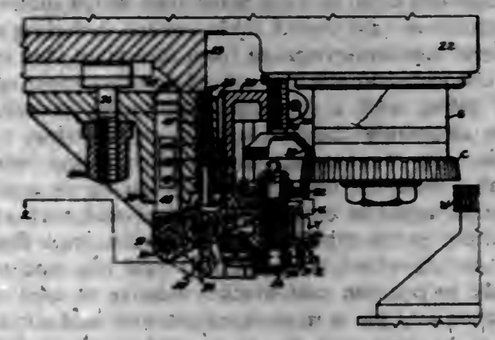
---

2,769,286
PULPSTONE
Walter F. Bath, Worcester, Mass., assignor to Norton Company, Worcester, Mass., a corporation of Massachusetts
Application September 30, 1955, Serial No. 537,641
10 Claims. (Cl. 51—206.4)

1. A pulpstone comprising a hollow cylindrical metallic drum having holes therethrough located in a regular pattern, metal bolts extending through said holes and projecting therebeyond into the inside of said drum and from the outside of said drum, the bolts having threaded ends where they project inside of said drum and the bolts having convoluted heads where they project outside of said drum and having base portions under said convoluted heads which contact the exterior of said drum and hold the heads free of tension, nuts on the threaded ends of said bolts said nuts being tightened to produce a tension of at least 3,000 pounds on said bolts, pulpstone blocks having holes into which said convoluted heads project said pulpstone blocks being made of bonded abrasive material and having holes to receive the convoluted heads, and room temperature set cement between the blocks and the outer surface of said drum and in the holes in the blocks and on the convoluted heads said cement securing said blocks in place on the convoluted heads and on the outside of the drum.

---

2,769,287
VALVE SEAT GRINDER
Ewald A. Arp, Minneapolis, Minn., assignor to Tobin-Arp Manufacturing Company, Minneapolis, Minn., a corporation of Minnesota
Application August 31, 1955, Serial No. 531,792
13 Claims. (Cl. 51—241)



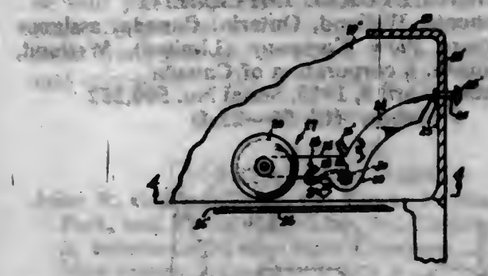
1. In a grinder to be applied to a centering arbor when grinding a valve seat or the like, coaxial with the arbor, the combination with a sleeve having a bore fitting freely over said arbor and a rotary grinder mounted for rotation on said sleeve, of a lifter device received within the bore of said sleeve comprising a base member adapted to rest against said arbor, a spring on said base member and a head member including a surface against which said

spring thrusts and spaced limbs rigid with said surface and at opposed sides of said base member having means for maintaining pressure against an internal surface of said bore.

---

2,769,288
CUTTER RECONDITIONING APPARATUS
Wendell P. Norton, Jr., Springfield, Vt., assignor to The Fellows Gear Shaper Company, Springfield, Vt., a corporation of Vermont
Application August 4, 1955, Serial No. 526,361
12 Claims. (Cl. 51—241)

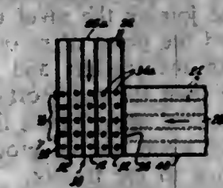
1. In a machine of the character described having a cutter saddle, a cutter spindle mounted for rotation and reciprocation in said cutter saddle, and a rotatable work spindle adjacent to said cutter spindle, a means for sharpening a cutter mounted on said cutter spindle comprising a base member fixed to said machine, an arbor support member mounted on said base member, said arbor support being mounted for vertical movement with said cutter spindle, a sharpening tool mounted on said arbor support and adapted to engage said cutter and means to impart vertical reciprocation to said arbor support in accordance with the reciprocation of said cutter spindle.



---

2,769,289
SHARPENING DEVICE FOR FOOD SLICING MACHINES
Jack Gilbert, Newburgh, and Harry Prable, Jr., Cross River, N. Y., assignors to General Slicing Machine Co., Inc., Walden, N. Y., a corporation of New York
Application September 9, 1955, Serial No. 533,416
4 Claims. (Cl. 51—248)

1. In a sharpening device for the cutting edge of a blade which is movably mounted on a frame, an axis pin extending from the frame, a wire spring anchored on said pin and extending therefrom; the free end of said spring being in the form of a hook, an arm pivotally mounted on said pin and being capable of sliding on and off said pin,

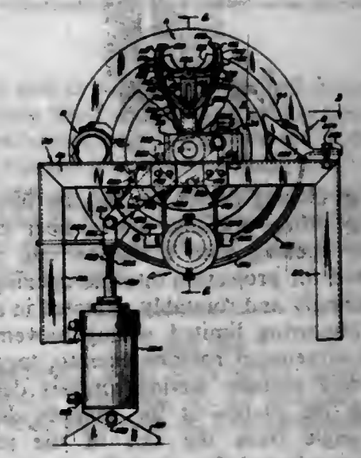


a blade-sharpening element carried on said arm away from said pin; said hook extending away from said pin in the direction of the sharpening element and engaging said arm; said spring being biased whereby it presses the arm towards the part of the frame said pin extends from and urges said arm and sharpening element away from the blade, means on the frame, acting as a stop to limit the movement of the arm away from the blade and an operat-

ing member associated with said arm to shift same so that the sharpening member is brought into contact with the blade; the locus of movement of the cutting edge of the blade being intersected by the locus of movement of the sharpening element; said spring being biased whereby when said arm is removed from the pin and disengaged from said hook, said hook will assume a position further away from the blade and towards the part of the frame said pin extends from.

---

2,769,290
METHOD AND APPARATUS FOR MAKING TEA BAGS OR THE LIKE
Arthur J. Horsman, Glen Ridge, N. J., assignor to Thomas J. Lipton Inc., Hoboken, N. J.
Application November 7, 1952, Serial No. 319,281
4 Claims. (Cl. 53—29)



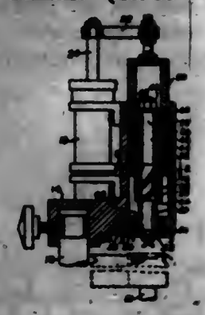
1. The method of making a tea bag or the like comprising, forming a first elongated web of bag forming material with a plurality of spaced stripes of thermoplastic adhesive extending lengthwise only of said web, forming a second elongated web of bag forming material with a plurality of spaced stripes of thermoplastic adhesive extending lengthwise only of said web, advancing said second web over said first at about a right angle thereto so said stripes of adhesive intersect at right angles, introducing a plurality of doses of the tea or the like between the stripes on said webs and heat sealing said webs together along said adhesive stripes to form a plurality of compartments, and severing said compartments into individual bags.

---

2,769,291
CAN FILLING MECHANISM
Carsten O. Christensen and George H. Vanlaan, Bellingham, Wash., assignors to Bellingham Chain & Forge Company, Seattle, Wash., a corporation of Washington
Application November 26, 1952, Serial No. 322,733
16 Claims. (Cl. 53—123)

4. In a container filling device, a frame; hanger means rotatably mounted on said frame; a plurality of equally spaced closure elements mounted on said hanger means adapted to successively receive and grip predetermined quantities of foodstuff at a first position; a plurality of spaced container carriers operatively connected to said hanger means adapted to receive and hold containers in alignment with respective closure elements; means mounted on said frame operatively engaging said closure elements for successively opening and closing consecutive closure elements; actuating means operatively connected to said hanger means for simultaneously intermittently rotating and indexing said closure elements and carriers at successive positions; a plurality of cutters mounted on said frame at a second position to sever foodstuff delivered to said second position by successive closure elements; a selectively operable ejector mounted on said frame in a third position in alignment with successive

closure elements and containers indexed to said third position adapted to eject said foodstuff from said elements into said containers; a support stationarily mounted on said shaft in spaced relation to said carriers for supporting the containers in said carriers; and a cam on said support having a maximum rise at said third position extending toward said elements whereby said carriers move said containers to said maximum rise in contiguous relation with the side of said elements when indexed to said third position.

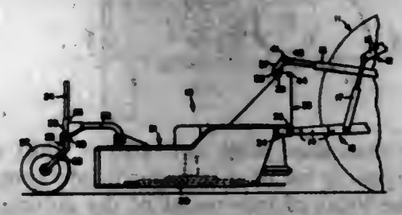


---

2,769,292
CONTAINER CLOSING MECHANISM
Stewart T. Day, Azle, Tex., assignor of fifty-one percent to William E. Shields, Jr., Azle, Tex.
Application January 18, 1954, Serial No. 404,678
9 Claims. (Cl. 53—314)

1. A container closing mechanism including a cap feeding element having means for suspending a cap for engagement by and loose application to a container, an elongated stationary guide member adjacent the cap feeding element for receiving and supporting the loosely applied cap, means for advancing a container beneath said element and guide member whereby the cap is engaged by and loosely applied to the container and carried through the guide member, and means for lifting the container relative to the cap and guide member and moving the container upwardly without rotation into sealing engagement with the cap, said guide member confining the loosely applied cap against lateral and vertical displacement during advancement of the cap with the container.

2,769,293
**DEVICE FOR EXPANDING SHALLOW CUP PLUGS IN FIBER CONTAINER OPENINGS**
Herbert F. Cox, Jr., Syracuse, N. Y.
Original application December 10, 1951, Serial No. 260,873. Divided and this application February 23, 1954, Serial No. 411,818
3 Claims. (Cl. 53—330)



1. In a cap closing device for flat-top fiber containers having a top filling opening, and a fiber cap mounted adjacent said opening with a shallow cup plug formed therein aligned for projection into the opening, a bracket, a plunger slidingly and rotatably mounted in said bracket, means for imparting limited sliding movement to said plunger and subsequent rotation thereto, toggle members carried by said plunger having tongues depending oppositely with the planes of the tongues disposed at a substantial angle from the axis of the plunger, said tongues being adapted for spreading upon engagement with the bottom of a cup plug with said tongues extending oppositely and lying in a common plane transverse of the axis of said plunger, said tongues having diametrically opposed surfaces adapted to engage the side wall of a shallow cup plug when expanded, and adapted upon rotation of said plunger to expand the side wall of the plug beneath and beyond the marginal edge of a filling opening through which the plug is projected.

2,769,294
**PEA HARVESTER**
William L. Goodlad, New Richmond, Wis.
Application July 10, 1952, Serial No. 298,063
12 Claims. (Cl. 56—21)

1. An apparatus for harvesting peas and the like having a wheeled frame, a cutting means on said frame and positioned to engage vines substantially close to the surface of the ground for the cutting thereof, an endless conveyor positioned adjacent said cutting means for elevating said vines, said endless conveyor having a terminal end positioned to discharge said vines into a threshing apparatus comprising in combination a second endless conveyor, said second endless conveyor having a plurality of depressions forming apertures therethrough, a plurality of linear projections extending at inclined angles adjacent said apertures, a plurality of spaced reciprocatory rake members located above said second endless conveyor for compacting the vines and peas between said members and said endless conveyor, a trough located beneath said second endless conveyor having a discharge end for discharge into a second trough, said second trough having a discharge end, guide means positioned above said second trough and adjacent the discharge end of said second conveyor for guiding vines and pods thereover, said guide means having a plurality of apertures therethrough, a hopper for collecting said vines and pods from said second endless conveyor, and motor means for driving said first and second conveyors, said cutter, said rakes, said reciprocatory members simultaneously.

2,769,295
**HITCH DEVICE FOR TRACTOR DRAWN AGRICULTURAL IMPLEMENT**
John A. Northcote, Welland, Ontario, Canada, assignor to John Deere Plow Company (Limited), Welland, Ontario, Canada, a corporation of Canada
Application April 8, 1955, Serial No. 500,252
5 Claims. (Cl. 56—25.4)

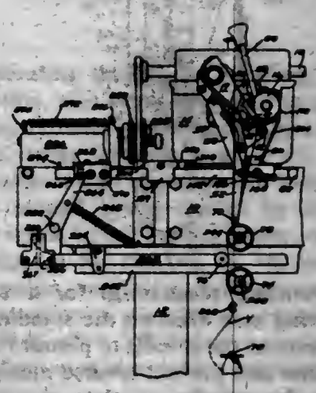
5. An agricultural implement adapted to be connected with a tractor having a pair of lower laterally spaced apart draft links and a centrally disposed upper thrust link, said implement comprising frame means, a pair of lower laterally spaced apart draft link-receiving means carried by said frame means above said lower link-receiving means thrust link-receiving means carried by said frame means, comprising a freely swingable connecting arm pivoted to said frame means above said lower link-receiving means and extending generally downwardly from said frame means, pivot means at the lower end of said arm to receive the rear end of said upper thrust link, stop means acting between said arm and said hitch structure so as to prevent upward swinging of said link beyond a point below a straight line joining the pivot of said arm with the frame means and the point of pivotal connection of said thrust link with the tractor, and ground-engaging means supporting at least the rear portion of the weight of said frame means, said upper thrust link and said arm buckling downwardly when uneven ground acts to raise the implement relative to the tractor.

2,769,296
**BALANCED DOUBLE KNIFE MOWER**
Ernest C. Carlson, Wheaton, and Edwin F. Huddle, Elmwood Park, Ill., assignors to International Harvester Company, a corporation of New Jersey
Application October 9, 1953, Serial No. 385,217
3 Claims. (Cl. 56—297)

1. In a mowing device, a mower support frame comprising a laterally extending coupling member terminating in an outer end, a yoke housing connected to said outer end of said coupling member, a carrier structure pivotally connected to said yoke housing on a fore and aft axis for vertical pivotal movement, a pair of reciprocating members slidably mounted upon said carrier structure for longitudinal reciprocal movement and including at least one sickle, a crankshaft journalled on said yoke housing on a fore and aft axis and having a pair of diametrically opposed throws, pitmans rotatably connected to said throws and respective members and enclosed in said yoke housing, and driving means connected to said crankshaft and including driving and driven pulleys mounted respectively on said frame and crankshaft and a belt trained thereabout, and said driving means disposed in an upright plane extending lengthwise medially of said members, and said driven pulley being disposed in close proximity to the ground in the operating position of the mowing device, and said driving pulley disposed at a level of a power take-off of an associated tractor, and tension spring means connected at one end to said yoke adjacent to said crankshaft and extending generally parallel to said plane diagonally upwardly away from the yoke, and a standard connected to the frame and connected to the other end of the spring means.

2,769,297
**BALANCED MOWER**
John R. Orelind, Wilmette, Edwin F. Huddle, Elmwood Park, and Ernest Scott Ulm, Jr., Chicago, Ill., assignors to International Harvester Company, a corporation of New Jersey
Application August 13, 1953, Serial No. 373,948
1 Claim. (Cl. 56—306)

In a harvester of the type comprising a support frame having means for mounting on a tractor, a mower assembly including a mower bar and a sickle reciprocal thereon, a coupling member pivotally carried on said support frame on a generally horizontal axis for vertical swinging movement and said coupling member pivotally connected to said mower bar on a generally horizontal axis whereby said mower assembly is pivotal upwardly and downwardly about said coupling member and swingable vertically with said coupling member, a driving shaft journalled on the support frame on a fore and aft extending axis, a sheave connected to the driving shaft, a belt trained about the sheave, a pitman connected at one end to the sickle, the improvement comprising: driving means for the sickle including a casing having means for attachment to said support frame, a shaft member journalled on the casing and extending outwardly of the casing, a sheave element connected to said shaft member outwardly of said casing, a counterweight and a wristpin connected to said sheave element at diametrically opposite sides of said shaft member, a first bevel gear within said casing connected to said shaft member, a second bevel gear within said casing journalled on said shaft member and having a counterweight at one side thereof, bevel gear means between and meshing with said bevel gears and journalled on the casing, said wristpin adapted to be journalled to the other end of said pitman, and said casing and frame having means for the mounting of said casing with the axis of said shaft member below and generally parallel to said driving shaft and said sheave and element vertically aligned with said belt trained thereabout whereby said bevel gears and sheave and element are adapted to operate in vertical planes and the gyroscopic effect of said driving means is entirely imposed upon said support frame.

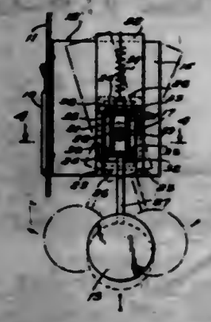


2,769,298
**TREE SHAKERS**
John P. Jones, Portland, Oreg.
Application May 11, 1955, Serial No. 507,657
3 Claims. (Cl. 56—328)

1. The combination with a tractor, of an air operated, electrically controlled tree shaking structure, attached to and extending forwardly of said tractor, comprising a frame, a socket attached to one end of said frame, a hollow boom connecting said socket and frame with the tractor for the purpose of supporting the frame, a cylinder having one integral head and one detachable head extending forwardly from said frame, means to affix said cylinder to the frame, a reciprocable piston

operable in said cylinder, a piston rod integral with said piston, a cross head attached to said piston rod without the cylinder, a magnetic valve mounted within the frame and coupled to the detachable cylinder head, an air supply tank mounted on the tractor, hose connections leading from said tank to the hollow boom, another hose passing through the frame to deliver air from the hollow boom to the magnetic valve.

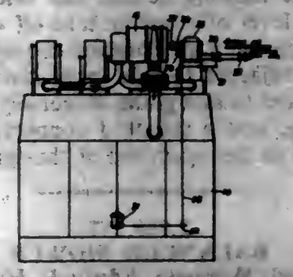
2,769,299
**TWISTING AND WINDING MACHINE**
John V. Keith, Warwick, R. I., assignor to Universal Winding Co., Cranston, R. I., a corporation of Massachusetts
Application April 25, 1951, Serial No. 222,887
24 Claims. (Cl. 57—62)



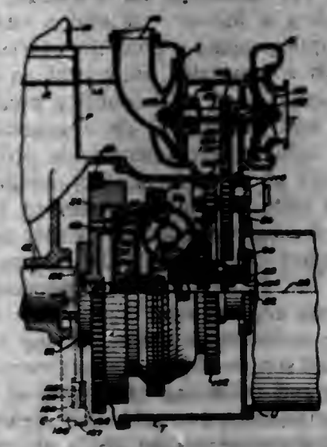
20. In a machine for twisting and winding yarn the combination comprising a twisting spindle, a motor for rotating said twisting spindle, a winding spindle, a motor for rotating said winding spindle to wind a strand of yarn twisted by said twisting spindle on a core carried by said winding spindle to form a package of yarn thereon, a yarn guide for traversing a strand of yarn twisted by said twisting spindle lengthwise of said core, said winding spindle and said yarn guide being mounted on said machine for movement relative to each other so as to be capable of separating as the package being wound increases in diameter, means to positively separate said winding spindle and said yarn guide at a rate substantially equal to the increase in the radius of the package being wound, means actuated by said separating means for controlling said second mentioned motor to decrease the speed of rotation of said winding spindle to cause said twisted strand of yarn to be wound at a substantially constant yarn speed, tension control means engageable by said strand of yarn and operable by said separating means to reduce the tension in the twisted strand of yarn being wound, means to start said first mentioned motor, and means actuated by said last mentioned means for starting said second mentioned motor a predetermined time interval after said twisting spindle starts to rotate.

2,769,300
COMPOSITE TEXTILE YARN
William G. Lattge, Brooklyn, N. Y., assignor to The Chemstrand Corporation, Decatur, Ala., a corporation of Delaware
Application April 3, 1953, Serial No. 346,790
10 Claims. (Cl. 57—140)

8. A composite yarn for barrier-type textile materials comprising a hydroscopic core of continuous filament viscose rayon and a hydrophobic wrapping portion of staple fibers formed from a copolymer containing at least 80% by weight in the polymer molecule of acrylonitrile and at least one percent of another mono-olefinic monomer copolymerizable therewith.



2,769,301
SELF-WINDING MECHANISM FOR VEHICLE CLOCK
Joseph N. Lieberman, North Miami Beach, Fla.
Application April 22, 1954, Serial No. 424,884
3 Claims. (Cl. 58—46)

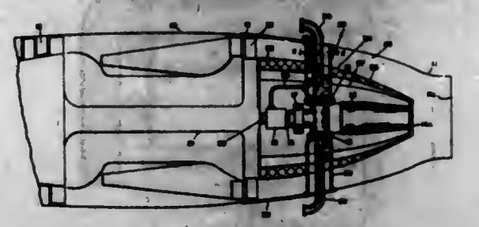


1. In a self-winding mechanism for a vehicle clock, a spindle, a driving gear fixed on the spindle, a pawl and ratchet appurtenant to the spindle to permit rotation thereof in one direction and prevent reverse motion, a toothed wheel fixed to the spindle, a plate supported on the spindle for swinging movement in a plane perpendicular to the axis of the spindle, a frame carried on the plate for limited up and down movements, resilient means normally holding the frame in its center position, a pendulum weight attached to the frame to cause oscillatory movement of the frame together with the plate and upward and downward movements of the frame independently of oscillatory movement of the plate, means carried by the frame to engage the toothed wheel to cause rotation thereof in winding direction upon swinging movement of the plate in one direction and upon upward and downward movements of the frame.

2,769,302
MEANS FOR SUPPLYING COMBUSTION AIR TO INTERNAL COMBUSTION ENGINES
William Hamilton Purdie and Percy Jackson, Sunderland, England, assignors to William Doxford & Sons Limited, Sunderland, England, a British company
Application January 22, 1952, Serial No. 267,525
Claims priority, application Great Britain January 24, 1951
8 Claims. (Cl. 60—13)

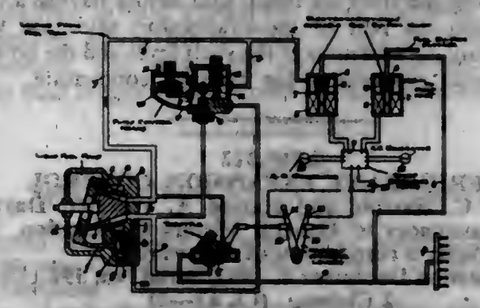
1. An internal combustion engine having a manually operable control for the quantity of fuel supplied to the engine, a blower for supplying combustion air to the engine, a turbine wheel driven by the engine exhaust gases and coupled to the blower to effect operation thereof, additional power-producing driving means for the blower supplied from a source independent of the operation of the engine, a control for the power produced by said additional driving means and a coupling between the fuel control and the control for the additional power operative progressively to reduce the power produced with increase in the supply of fuel to the engine and progressively to increase the power produced when the fuel control is moved to decrease the supply of fuel to the engine.

2,769,303
SPLIT PATH TRANSMISSION AND SUPERCHARGER DRIVE
Carroll J. Lucia, Birmingham, and Julius E. Witzky, Royal Oak, Mich.; said Lucia assignor to Studebaker-Packard Corporation, Detroit, Mich., a corporation of Michigan
Application May 14, 1953, Serial No. 355,086
17 Claims. (Cl. 60—13)



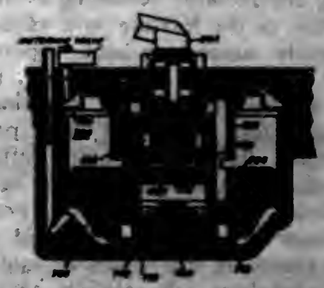
1. For use with a supercharged engine source of prime power, the combination of a drive shaft, a load-connected driven shaft, means for providing parallel power paths between said shafts constituted by a primarily speed reducing train having a secondary speed increasing portion, said means comprising a planetary differential gear component having a driving portion connected to said drive shaft and provided with a main output portion driven at a varying reduction ratio between stall and 1:1 and connected to said driven shaft and a reaction member having a speed varying above 1:1 in an inverse ratio with respect to the speed of said main output portion and constituting said secondary speed increasing portion of said train, and a torque-multiplying hydrodynamic slip drive component for coupling together said reaction member and said driven shaft in slip-drive-transmitting relationship so as to slip progressively more under increasing load, and an engine supercharger having a step-up gear train for driving the same at a proportional greater speed than the speed of said reaction member whereby, under conditions of drastic speed decrease of the driven shaft due to load and a consequent increase of slip in the torque multiplying slip drive component, the compensating inverse speed effect of the reaction member causes a relative increase in the overall speed increasing ratio through said differential gear component and said step-up gear train to said supercharger.

2,769,304
HYPERGOLIC FUEL AND THE METHOD OF USING IT
Joe M. Burton, Waco, Tex., assignor to Phillips Petroleum Company, a corporation of Delaware
No Drawing. Application July 6, 1954, Serial No. 441,625
4 Claims. (Cl. 60—35.4)



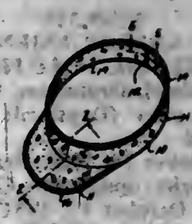
4. In the method for developing thrust by the combustion of bipropellant components in a combustion chamber of a reaction motor the steps comprising separately and simultaneously injecting a stream of a fuel component and an oxidant component into contact with each other in the combustion chamber of said motor, in such proportions as to produce spontaneous ignition, said fuel component consisting essentially of between 10 and 87 percent by volume of pyrrole and between 90 and 13 percent by volume of ethylenimine.

2,769,305
POWER PLANTS COMPRISING MAIN AND AUXILIARY ENGINES
George Chernowitz, Caldwell, N. J.
Application January 6, 1949, Serial No. 69,570
7 Claims. (Cl. 60—35.6)



1. A power plant comprising a jet engine having an exhaust exit, and a rocket engine mounted within the jet engine and short of said exhaust exit, and constructed and arranged within the jet engine so as to provide between the rocket engine and the exhaust exit of the jet engine a mixing zone for the exhaust gases of both engines whereby the exhaust gases of the rocket engine will discharge into the exhaust gases of the jet engine to exercise an ejector action on the exhaust gases of the jet engine.

2,769,306
MEANS FOR SYNCHRONIZING THE SPEEDS OF A PAIR OF AIRCRAFT ENGINES TO WHICH FUEL IS SUPPLIED BY PUMPS AND AIR BY BLOWERS
Thomas Alfred Harris, Edgbaston, Birmingham, England, assignor to Joseph Lucas Limited, Birmingham, England
Application November 16, 1950, Serial No. 195,960
4 Claims. (Cl. 60—39.15)

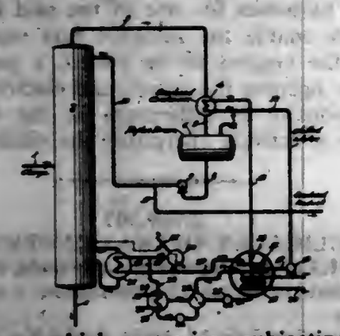


1. Means for synchronising the speeds of a pair of aircraft engines to which liquid fuel is supplied by pumps and air by blowers, the pumps and blowers being driven by the engines supplied thereby, comprising in combination with a pair of systems for supplying fuel to the engines respectively, a pair of automatic fuel-controlling devices respectively connected to the fuel supply systems and responsive to the pressure of at least one of the fluid mediums supplied by the pumps and blowers, a pair of normally closed valves arranged to serve, when opened, as by-passes for one of the said fluid mediums, and thereby enable the rates of fuel supply from the pumps to the engines to be varied, a pair of electromagnets for opening the valves, and electrical controlling means responsive to differences in the speeds of the engines for selectively energizing the electromagnets.

2,769,307
HYDRAULICALLY OPERATED SERVO-MOTOR
Forest R. McFarland, Huntington Woods, Mich., assignor to Studebaker-Packard Corporation, a corporation of Michigan
Application July 14, 1950, Serial No. 173,789
4 Claims. (Cl. 60—97)

1. An operating device for effecting an engaging or releasing action, said device comprising a cylinder, a first piston in the cylinder which is connected on one side to receive fluid under pressure to drive the piston in an engaging direction and on the other side to receive a cushioning fluid, a second piston carried by the first piston, a vent valve carried by the second piston, means for supplying fluid pressure for moving the second piston relative to the first piston, said valve and first and second pistons having interconnected passageways connected to vent the cushioning fluid when full engaging pressure is developed upon movement in said engaging direction.

2,769,308
THERMAL APPLICATOR FOR HEAD
Louis R. Krasno, Pensacola, Fla.
Application September 22, 1954, Serial No. 457,768
1 Claim. (Cl. 62—1)



As a new article of manufacture, a headpiece formed from sponge material and adapted to be initially saturated with water, including, a headband completely encircling the head, and an outwardly and downwardly projecting flexible visor secured thereto, the circumferential edges of said band and the outer edge of said visor being compressed and whipped with stitching to add rigidity to the headpiece and to confine the moisture to the larger surfaces and main portions of the article.

2,769,309

## PROCESS AND APPARATUS FOR SEPARATING FLUID MIXTURES

Robert L. Irvine, Belle Fons Farm, Pa., assignor to Gulf Oil Corporation, Pittsburgh, Pa., a corporation of Pennsylvania

Application August 7, 1952, Serial No. 303,184
4 Claims. (Cl. 62—2)

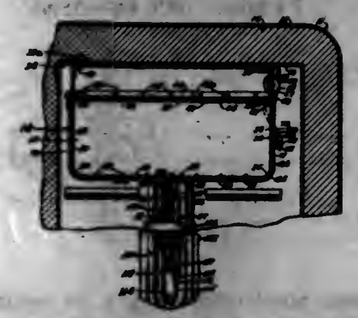
1. The process which comprises subjecting a narrow boiling range fluid mixture to fractionation in a fractionating column, continuously removing overhead the more volatile fraction of the mixture as a vapor, cooling and at least partially condensing such vapors by heat exchange with a stream of chilled liquid refrigerant delivered from an evaporation zone, imposing a pressure in said evaporation zone below the vapor pressure of said liquid refrigerant, chilling said liquid refrigerant stream by partial evaporation of the liquid in said evaporation zone, maintaining the pressure in said evaporation zone below the vapor pressure of the liquid refrigerant by continuously absorbing the vapors of said refrigerant in a stream of absorbent salt solution, thus diluting said solution, passing said stream of diluted absorbent salt solution from the zone of absorption to a generating zone, heating the diluted absorbent salt solution in said generating zone to generate refrigerant vapor and reconcentrate said solution, returning the reconcentrated solution to the zone of absorption, exchanging heat between at least a portion of said refrigerant vapor and the bottom liquid of said fractionating column whereby to condense said refrigerant and reboil said column, passing another portion of said refrigerant vapor into heat exchange with a coolant in a separate heat exchanging zone, controlling the rate of flow of coolant to said separate heat exchanging zone in accordance with pressure variations within said fractionating column whereby to increase the rate of flow of coolant to said separate heat exchanging zone when the pressure in said fractionating column tends to rise above a predetermined pressure level, and returning the condensed refrigerant to the zone of evaporation.

2,769,310

## COOLING ARRANGEMENTS USING EUTECTIC SOLUTIONS

Frank Samuel Stickland, Orpington, England, assignor to J. Stone & Company (Deptford) Limited, Deptford, London, England

Application October 14, 1952, Serial No. 314,723
Claims priority, application Great Britain October 18, 1951
1 Claim. (Cl. 62—2)



In refrigerating arrangements, a tank for containing a eutectic solution serving as a cold-storing medium, said tank having walls through which heat passes by conduction to the eutectic solution for effecting the cooling, a cooling coil extending within said tank for flow of a fluid refrigerating medium for cooling and freezing said eutectic solution, means for withdrawing said eutectic solution from said tank when in the liquid state and agitating said withdrawn solution to reduce precipitation and settling out of the solute of said eutectic solution, said withdrawing and agitating means comprising a system of piping connected with said tank, a pump connected in said system, an electric motor connected for driving said pump, said motor having an electric current supply circuit connected thereto, a current connecting and interrupting device connected in said circuit, thermostatic means responsive solely to the temperature of the eutectic solution for controlling said current connecting and interrupting device to close said circuit and supply current to said motor only when said solution is at a temperature substantially above its freezing point.

2,769,311

## DEFROSTING EVAPORATORS

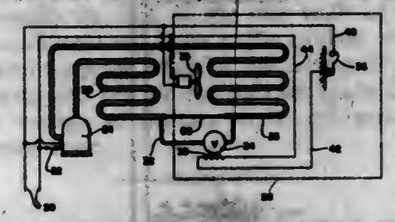
Thomas W. Duncan, Bedford, Ind., assignor, by mesne assignments, to Whirlpool-Seeger Corporation, a corporation of Delaware

Application July 2, 1953, Serial No. 365,694
6 Claims. (Cl. 62—3)

2. In a defrosting system for a household refrigerator, the combination of an insulated cabinet, comprising an outer metal shell, an inner liner, and insulation between them, said cabinet having a door opening, and an insulated door, an evaporator comprising a substantially U-shaped metal casing provided with a transverse freezing shelf, said evaporator being supported from the top of the liner, below freezing coils on the bottom of the shelf for producing an ultra-below freezing zone above the shelf, below freezing coils on the sides and bottom of said casing for cooling the space outside said evaporator to an above-freezing temperature, and the space inside the evaporator, below the shelf, to a below-freezing temperature, and a depending U-shaped leg of tubing connected to said coils, and having an electric heater applied to one of the branches of said U-shaped leg, for heating the refrigerant and causing it to circulate upward in the heated branch and downward in the other branch, the hot refrigerant heating all the evaporator coils and casing and melting the frost on them, said casing having a rear wall closing the rear of the evaporator, said rear wall having drainage apertures at the shelf level and the bottom level of said evaporator, for draining condensate.

2,769,312

## REFRIGERANT EXPANSION CONTROL

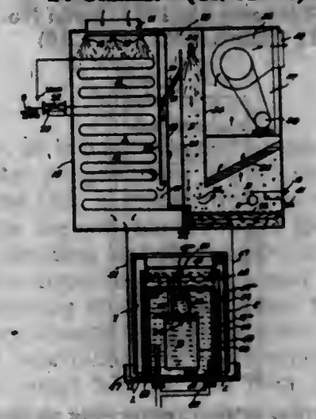


Marshall C. Harrold and Harold A. Wheeler, Dayton, Ohio, assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application December 4, 1953, Serial No. 396,158
2 Claims. (Cl. 62—3)

1. In combination, a refrigerating apparatus including a closed refrigerating circuit having a motor compressor unit and a condenser and a flow control means

and a single evaporator connected in circuit in the order named, said evaporator being located in heat exchange relation with a medium to be cooled, a manual control switch for continuously connecting said motor compressor unit to a power source for continuous operation, said flow control means including a restrictor and a valve means connected in series, said valve means having a



heat motor for moving said valve means from one position to another, a control circuit including a heating means for said heat motor and a temperature responsive switch means located in heat transfer relationship with and responsive to said medium to be cooled for controlling said system to regulate the temperature of said medium.

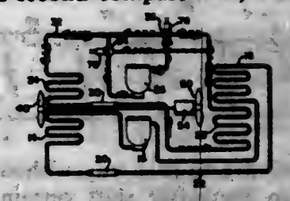
2,769,313

## HYGROSCOPIC AIR CONDITIONER

Michael Bernard Goetz, Philadelphia, Pa.

Application April 23, 1954, Serial No. 425,249
14 Claims. (Cl. 62—6)

1. An air conditioning system of the class described comprising a dehumidifier, an evaporative cooler communicating with said dehumidifier, a regenerator and thermal re-circulator unit, said unit having a plurality of fluid evaporating chambers, a floating element in said unit above said chambers subjected to atmospheric pressure and defining an expansible vapor receiving chamber, means for delivering vapor from said first mentioned fluid evaporating chambers to said expansible vapor receiving chamber, said last mentioned means also providing a fluid passage from said expansible vapor receiving chamber into said fluid evaporating chambers, means for conveying cold dilute sorbent from said dehumidifier to said expansible vapor receiving chamber, a heating means for the fluid in said fluid evaporating chambers, and means for conveying concentrate from said fluid evaporating chambers to said dehumidifier.



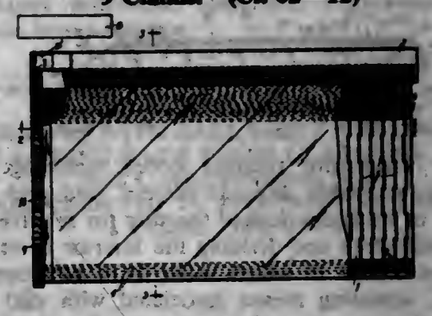
2,769,314

## WINDOW MOUNTED REFRIGERATING APPARATUS

Harold A. Wheeler, Dayton, Ohio, assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application April 1, 1955, Serial No. 498,552
4 Claims. (Cl. 62—6)

4. In an air conditioning unit of the type adapted to be mounted in a window with one portion of the unit projecting into the room and another portion projecting into the outside atmosphere, a housing, means separating said housing into first compartment for conditioning air for said room and a second compartment arranged in thermal exchange relationship with the outside air, a first refrigerating system including an evaporator located in said first compartment and refrigerant liquefying means located in said second compartment, a second refrigerat-



ing system of the reverse cycle type having a first heat exchange coil in said first compartment and a second heat exchange coil in said second compartment, means for selectively absorbing heat from air in one of said heat exchange coils and for dissipating the heat in the other of said heat exchange coils, means responsive to the temperature of the air to be conditioned for controlling the operation of said second refrigerating system.

2,769,315

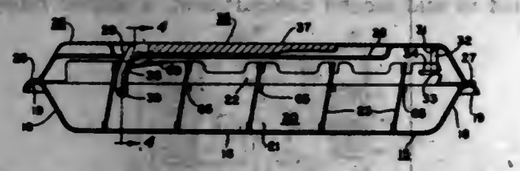
## ARTIFICIAL ICE RINK

Clifford A. Meadows, Toronto, Ontario, Canada

Application April 14, 1954, Serial No. 423,107
9 Claims. (Cl. 62—12)

3. In a pick-up artificial ice rink provided with a basic refrigerating apparatus including feed and return headers; a knock-down construction of an absorbing heat exchange assembled upon a supporting surface of a predetermined area having a retaining curbing for confining a shallow body of water for conversion into an ice rink; said absorbing heat exchanger comprising thin-walled refrigerating tubing of pliant material laid in a general uniform manner upon said supporting surface with suitably spaced parallel reaches and having ingress and egress couplings connected to said headers, and a distributed arrangement of spacing devices for maintaining the several reaches of the tubing in their spaced disposition, said spacing devices comprising plate-like strips of rigid material for extending across a plurality of the reaches, and elements on said strips for flanking the reaches which are crossed by the individual strips.

2,769,316



## FREEZING DEVICE

Robert R. Candor, Dayton, Ohio, assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application May 13, 1954, Serial No. 429,591
2 Claims. (Cl. 62—108.5)

1. A freezing device comprising in combination, an ice tray, a grid within said tray, said grid including a plurality of walls interlocked together for relative movement therebetween and dividing the interior of said tray into compartments in which water is to be frozen into ice blocks, force multiplying means on said device, a substantially inflexible one-piece cover separate and dis-

tinct from said grid walls and from said force multiplying means, said cover being unattached to said tray and extending continuously thereover in engagement with all four upright sides thereof to provide a closure for the compartments in said device, said force multiplying means being operable to initially bear against said separate one-piece cover for loosening the same from

and moving it relative to said tray without moving said grid walls and to thereafter shift certain of said grid walls with respect to others thereof to break an ice bond between ice blocks and said tray and said grid, and said grid, said cover and said force multiplying means being interlocked together as a unit whereby said unattachment of the cover and tray serves to provide for removal of said unit upwardly out of said tray.

---

**2,769,317**
**FREEZING DEVICE**

George H. Strickland, Dayton, Ohio, assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application May 13, 1954, Serial No. 429,502
2 Claims. (Cl. 62—108.5)

1. In a refrigerator freezing device including a tray and a grid removably disposed therein, said grid having a plurality of walls interlocked together for relative movement therebetween and dividing the interior of said tray into compartments in which water is to be frozen into ice blocks, actuating means associated with said device and adapted to engage and move some of said grid walls relative to others thereof, a rigid cover separate from said grid walls and movable with respect thereto independently thereof, a connection between said cover and said grid wall actuating means at one end of said device, said cover comprising a main body portion extending continuously over said tray with its peripheral edges engaging opposed upright sides thereof to close all of said compartments and an integral handle portion projecting outwardly beyond the side of said tray at the end of said device opposite its said one end thereof, the handle end of said cover being movable upwardly of said tray and said grid, means associated with said connection preventing initial upward movement of said cover from moving said grid walls whereby said initial movement of the cover is utilized solely for breaking a bond between said cover and sides of said tray, and further movement of said handle end of said cover beyond said initial movement thereof operating said actuating means through said connection to move said grid walls with respect to one another and loosen ice blocks from said tray and from said grid.

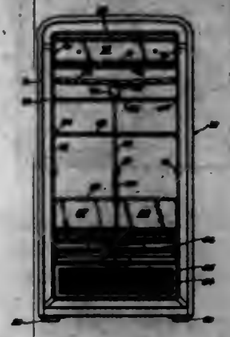
**2,769,318**
**REFRIGERATING APPARATUS OF DISSIMILAR METALS**

Leland H. Gremell, Oakwood, Ohio, assignor to General Motors Corporation, Dayton, Ohio, a corporation of Delaware

Application August 19, 1952, Serial No. 305,219
4 Claims. (Cl. 62—115)

2. In a refrigerating system, a compressor unit having steel inlet and outlet lines connected thereto, refrigerant condensing and evaporating means joined to said inlet and outlet lines, at least a portion of said means including an aluminum element, means for joining said aluminum element to one of said steel lines comprising an aluminum coating provided on said one steel line and a weld between said aluminum element and said coating.



---

**2,769,319**
**TWO TEMPERATURE HOUSEHOLD REFRIGERATORS**

Carl F. Alsing, Evansville, Ind., assignor, by mesne assignments, to Whirlpool-Seeger Corporation, St. Joseph, Mich., a corporation of Delaware

Application February 18, 1952, Serial No. 272,175
11 Claims. (Cl. 62—116)

1. A refrigeration system comprising an insulated cabinet having a below-freezing zone cooled by first below-freezing coils and a food storage zone cooled by second coils communicating without restriction with said first coils in series, to cool said second coils only with refrigerant from said first coils, a motor compressor comprising a motor, a compressor and a housing enclosing the motor and compressor, a condenser and a restrictor connected in this order to said first coils, said second coils communicating with the suction inlet of said compressor and said compressor having an oil sump, a charge of oil in said sump and a charge of refrigerant of a type miscible with and absorbed by said oil in said system, a portion of said refrigerant being absorbed in said oil at ordinary ambient temperatures, a larger portion being absorbed at lower ambient temperatures, and a lesser portion absorbed higher ambient temperatures, the volumes of said coils, said oil charge and said refrigerant charge being proportioned so that the amount of refrigerant not absorbed and available for cooling said first coils is sufficient to maintain a below-freezing temperature in the below-freezing zone at the highest ambient contemplated, and the amount of refrigerant available for said second coils is sufficient for cooling the food storage zone at a suitable above-freezing temperature at ordinary ambients, and is sufficient for increasing proportionately the cooling effect of said second coils at higher ambients due to the release of absorbed refrigerant from the oil at higher ambients, but decreasing the cooling effect of said second coils proportionately at lower ambients, due to greater absorption of refrigerant at the lower ambients, to avoid overcooling or undercooling the food storage space while maintaining below-freezing temperatures in the freezing zone, the said second coils being mounted on the outside of a substantially rectangular sheet metal member of sufficient length to extend from side to side inside the cabinet at the top of the cabinet, and to extend forwardly on each of the side walls of the cabinet to a point adjacent the front of the cabinet, said member being spaced from the inside of the cabinet by said second coils, leaving the rest of the cabinet space substantially open for storage of articles to be refrigerated in said food storage zone.

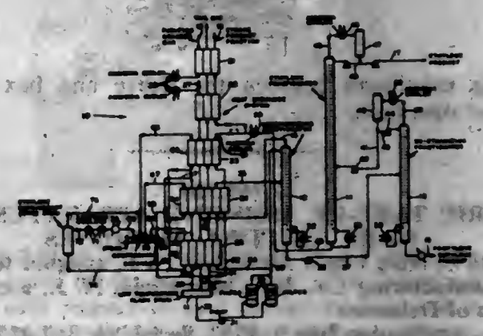
**2,769,320**
**DAMPER CONTROL MECHANISM FOR AIR CONDITIONING APPARATUS**

Donald Kuhlenschmidt, Newburgh, and Curtis O. Fowler, Spurgeon, Ind., assignors, by mesne assignments, to Whirlpool-Seeger Corporation, a corporation of Delaware

Application March 30, 1954, Serial No. 419,862
6 Claims. (Cl. 62—129)

1. A room air conditioning unit, comprising: a cooling element; means providing flow of a stream of air from the room in to the unit, in contact with said cooling element, and then from the unit into the room; the unit having an air inlet for admitting air from outdoors to said air stream, an outlet for exhausting air from said stream, and an inlet for admitting air from the room; first, second and third dampers actuated to closed position by spring biased hinges, and controlling the said outdoor air inlet, the said exhaust outlet, and the said room air inlet, respectively; said first and second dampers being biased to closed position and said third damper to open position; means operatively connecting said third damper to said second damper for conjoint movement therewith; means for actuating said first and second dampers including, a crank member having a portion thereon which upon rotation of the crank in one direction engages said second damper in an operative relationship, and motion-transmitting linkage operatively connecting said first damper to said crank member; said actuating means being fashioned and arranged so as to permit said crank to be rotated in one direction to engage and open said second damper without opening said first damper, and to be rotated in an opposite direction to open said first damper and simultaneously effect the disengagement of said portion of said crank from its operating relationship with said second damper so as to permit said latter damper to return to a biased closed position conjointly with the opening of said third damper.



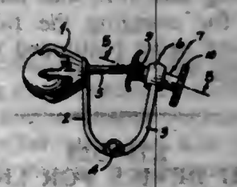
---

**2,769,321**
**SEPARATION OF ETHYLENE FROM A GASEOUS MIXTURE**

Samuel Robert Silas, Crookill, N. J., assignor to The M. W. Kellogg Company, Jersey City, N. J., a corporation of Delaware

Application August 7, 1952, Serial No. 303,114
10 Claims. (Cl. 62—175.5)

1. In a process for recovering ethylene from a mixture of low boiling gases, in which said low boiling mixture is cooled to partial liquefaction and is then fractionated to separate said gaseous mixture into several components, a method for recovering ethylene from a low boiling fraction which includes the steps of: separating said partially liquefied gaseous mixture subsequent to said cooling step, and at the coldest point in said process into liquid and vapor; removing said vapor from further contact with any process stream from which ethylene product is



derived; introducing said liquid into a first fractionating zone and fractionating said liquid therein into a relatively heavy fraction containing most of the ethylene and a relatively light fraction containing most of the relatively lighter gases and some ethylene; recycling said light fraction to said inflowing gaseous mixture as it flows to said liquid-vapor separation step; and recovering ethylene from said heavy fraction.

**2,769,322**
**EAR RING WITH BALL JOINT FOR SPACING CLAMPING FACE FROM CLAMPING ARM**

Jack Czach, Brooklyn, N. Y.

Application July 26, 1955, Serial No. 524,423
2 Claims. (Cl. 63—12)

1. An ear ring comprising two arms hinged together at their lower ends for movement in a common plane, a setting mounted on the movable end of one of said arms and facing outwardly, a threaded post fixedly mounted on said movable end and extending inwardly and laterally of the arm and lying in the same plane as said arms, a link pivotally mounted on the movable end of the second of said arms by means of a ball and socket and extending inwardly and outwardly therefrom, the free inward end of said link terminating in a nut threaded for engagement with said post, and the free outward end of said link terminating in a finger-piece, the nut and finger-piece being held spaced from said second arm by said ball and socket.

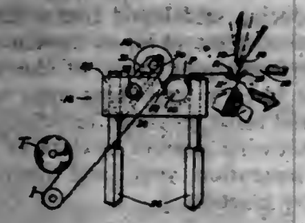
---

**2,769,323**
**COUPLING**

Joseph M. O'Malley, Worcester, Mass., assignor to Morgan Construction Company, Worcester, Mass., a corporation of Massachusetts

Application October 25, 1954, Serial No. 464,202
10 Claims. (Cl. 64—8)

1. A coupling comprising a coupling box for attachment to a driving shaft, a head for attachment to a driven shaft, a sleeve supported for sliding motion on occasion



within the said box, the said head being mounted in driving relation within the sleeve, and means for preventing

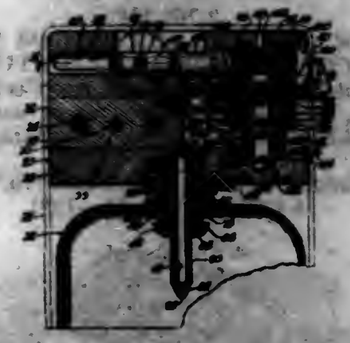
sliding movement between the sleeve and box during normal operation.

---

2,769,324
**FABRIC TAKE-UP ASSISTING APPARATUS FOR WARP KNITTING MACHINES**
Harold C. Noe, Upper Montclair, N. J., assignor to Kidde Manufacturing Co., Inc., Bloomfield, N. J., a corporation of Delaware
Application July 9, 1953, Serial No. 367,017
7 Claims. (Cl. 66—149)

1. In a warp knitting machine, the combination of knitting elements providing a knitting line, an elongate fabric supporting roll adjacent and parallel to the knitting line of said elements over which the fabric passes, said roll having a section at each end extending beyond an end of the knitting line, said sections increasing in diameter from adjacent the selvages towards the respective end of the roll where such section is located, means for rotatably supporting said roll, and means at only each of said sections for engaging the fabric adjacent the selvages thereof and being positioned to hold the fabric against said sections.

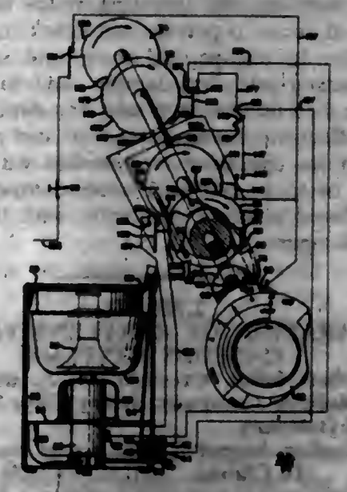
---



2,769,325
**FUELING DEVICE FOR LIGHTERS**
Clifford Storch, Great Neck, N. Y., assignor to Astorloid Manufacturing Company, Inc., Bronx, N. Y., a corporation of New York
Application July 20, 1955, Serial No. 523,192
3 Claims. (Cl. 67—7.1)

1. In a fueling device for a lighter mechanism having a wick chamber, a housing including a sleeve portion and a seat portion having a seat, a plug freely slidable in said housing and radially spaced therefrom to define an air exhaust space therebetween, said sleeve portion having an air aperture defined therein to provide communication between said chamber and said exhaust space, said plug having a normally open fueling inlet and an outlet spaced from said inlet, a conduit in said plug interconnecting said inlet and outlet, and means tensioned between said housing and plug normally operative to freely urge the latter into seating cooperation with said seat portion and to close said fueling outlet, said plug being operable in opposition to the normal urging of said means to further tension the same to open said fueling outlet and unseat said plug to define an air exhaust passageway between said seat and plug communicating with said wick chamber by way of said air exhaust space.

---

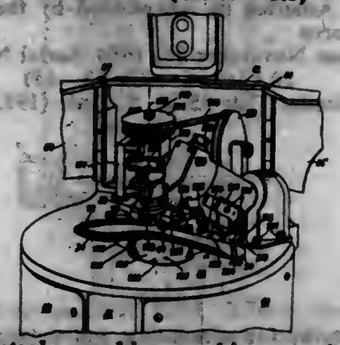


2,769,326
**SMOKERS' LIGHTERS**
Fred Berlin, Oconomowoc, Wis., assignor to The Parker Pen Company, Janesville, Wis., a corporation of Wisconsin
Application June 22, 1953, Serial No. 363,265
11 Claims. (Cl. 67—7.1)

1. A lighter comprising a chassis, a fuel tank connected to said chassis, a fuel outlet passage leading from said tank, means for controlling the flow of fuel from said outlet passage including a normally open valve and a freely rotatable ball reciprocable relatively to said valve for closing the latter, a sparking wheel rotatably carried by said chassis, a flint, means urging said flint into engagement with said sparking wheel, a drive element pivotally carried by said chassis for movement between two limit positions and having a portion movable over and into rolling contact with said ball when said drive element is moved into one said limit position for depressing said ball to close said valve, a one-way drive connection between said drive element and said sparking wheel for rotating the latter when said drive element is moved from its said one limit position to the other, and spring means resiliently urging said drive element toward its said one position.

---

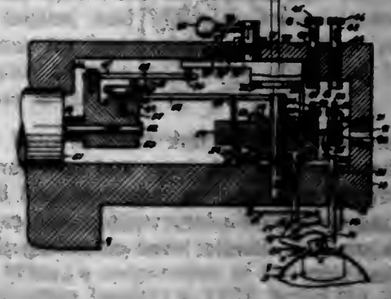
2,769,327
**DOMESTIC APPLIANCE**
William Smith, Jr., Dayton, Ohio, assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application September 20, 1952, Serial No. 310,716
10 Claims. (Cl. 68—12)



1. A washing machine including a clothes washing receptacle, a hot water supply and a cold water supply for said clothes washing receptacle, agitating means for agitating the contents of said receptacle, a timing means having means for alternately opening said cold and hot water supplies during one continuous timed filling period and having means for operating said agitating means during a period of time.

---

2,769,328
**OUTSOLE ROUGHING MACHINES**
Robert F. Lane, Beverly, and Fred L. Mooney, Lynn, Mass., assignors to United Shoe Machinery Corporation, Flemington, N. J., a corporation of New Jersey
Application December 3, 1954, Serial No. 472,934
16 Claims. (Cl. 69—6.5)



1. In an outsole roughing machine, a pair of supports which have circular work supporting faces and are rotatable about a common axis, a cutter which comprises a plurality of cutting blades each having an inner straight cutting edge portion and an outer toothed portion, said portions being rotatable about a common axis and during their rotation lying in different portions of a substantially frusto-conical surface, an edge gage which has a top face and a cylindrical peripheral face and which is rotatable with said supports about the first-named axis, means for yieldingly forcing the work supports toward the cutter and lengthwise of their common axis of rotation, a part of the portion of the substantially frusto-conical surface in which the straight cutting edge portions of the blades lie being arranged in close proximity and in opposed relation to said top face of the gage and another part of said substantially frusto-conical surface in which the straight cutting edge portions of the blades lie projecting beyond said peripheral face of the gage and forming with the portion of the substantially frusto-conical surface in which the outer toothed portions of the blades lie and with the work supporting faces of the sleeves and the peripheral face of the edge gage, a notch through which the margin of an outsole may be moved with an edge thereof in engagement with said peripheral face, and means for moving and guiding through said notch the outsole lengthwise of its edge with said edge in engagement with the face of the edge gage whereby to form on the margin of a face of the outsole a roughened band which is of uniform width and is spaced from the edge of the outsole by a smooth band, said cutter being bodily movable into different operating positions at right angles to the axis of rotation of the supports to vary the position of the substantially frusto-conical surface with relation to the edge gage and the work supporting faces of the supports whereby to vary the position of the roughened band and the width of the smooth band on the outsole.

2,769,329
**MACHINE FOR CUTTING SHEET MATERIAL**
Dieter Braun, Stuttgart-Hausen-Ost, and Kurt Hacker, Stuttgart, Germany, assignors to Fortuna-Werke Spezialmaschinenfabrik A.-G., Stuttgart-Bad Cannstatt, Germany
Application February 14, 1955, Serial No. 487,924
19 Claims. (Cl. 69—9.5)

1. A machine for cutting sheet material such as leather and the like, comprising, in combination, support means; cutting means carried by said support means for cutting the sheet material; guide means located adjacent said cutting means for guiding material to be cut by said cutting means; first adjusting means operatively connected to said guide means for adjusting the distance between the same and said cutting means; second adjusting means operative-

ly connected to said guide means for adjusting the angle of said guide means independently of said first adjusting means with respect to said cutting means; and moving means operatively connected to said first and second adjusting means for actuating the same to set said guide means successively at a plurality of different elevational and angular positions with respect to said cutting means.

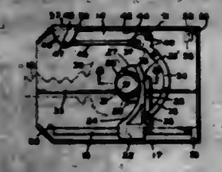
2,769,330
**LOCK HAVING A SLIDING LATCH BOLT**
John J. O'Connell, Sandy Hook, Conn.
Application January 24, 1955, Serial No. 483,459
5 Claims. (Cl. 70—97)



3. A lock for detachably securing together two structures and including a latch section adapted to be mounted in one structure and a keeper section adapted to be mounted in the other structure and provided with a wedge-shaped block having a downwardly and inwardly inclined upper surface and a generally horizontal lower surface, the latch section including a housing having a front opening which receives the block when the structures are moved into abutting relationship, said opening having an inclined upper wall and a horizontal lower wall which substantially abuts the lower wall of the block, a spring-actuated latch-bolt slidably mounted in the housing for movement parallel with the inclined upper surface of the block and whose lower surface contacts said inclined upper surface when the latch-bolt is in extended position and prevents withdrawal of the block from the opening, a manually operated lever for retracting the latch-bolt, and a manually operated dogging cam for restraining movement of the lever.

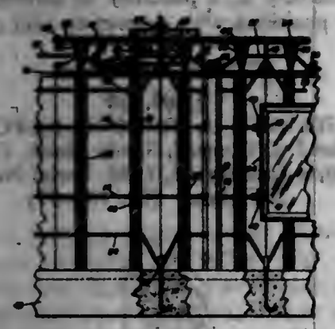
---

2,769,331
**KEY CASE**
Max Ellenbogen, Silver Spring, Md.
Application April 7, 1954, Serial No. 421,616
15 Claims. (Cl. 70—456)

2. A key case having an open end through which a key is longitudinally reciprocable, a track extending longitudinally of said case adjacent one side thereof, a carriage slidable on said track, a bracket extending laterally from said carriage having a slot therein extending laterally to said track, a keyholder mounted on said bracket; a link

lever having a carriage actuating pin at one end thereof extending within said carriage bracket slot, means for pivotally mounting the other end of said link lever within said case, said link lever pin moving from end to end of said carriage bracket slot, a handle lever having a con-

nection at one end to said link lever pivoted end, said connection between said link lever and said handle lever being eccentric to said pivoting means of said link lever, means pivoting said handle lever within said case, and a handle knob on said handle lever extending through a slot in one case side.



---

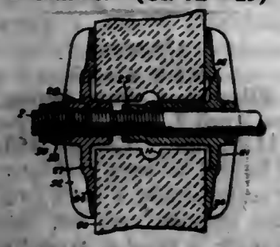
2,769,332

**PREFORMED SLAB AND SHELL CONSTRUCTION**

Charles Kepler Brown, Jr., Fairmont, W. Va.

Application December 18, 1950, Serial No. 201,466
1 Claim. (Cl. 72—1)

A building structure comprising a ceiling portion and a wall portion, each of said portions comprising parallel oppositely disposed panels, said panels having integrally formed therewith spaced lugs and partitions protruding alternately from one panel towards its opposing panel, with the lugs spaced from and the partitions contacting and spacing the panel opposite thereof, a plurality of aligned openings in each of said lugs and partitions, flexible cables extending through said openings and securing said opposing panels to each other, an anchor member having an aperture therein secured to the ceiling portion and extending downwardly towards the wall portion and one of the flexible cables securing the wall panels to each other extending through the anchor aperture to secure the ceiling portion to said wall portion, said wall portion supported on a floor and an anchor member extending from the said floor into the space between opposing wall panels and another of said flexible cable securing opposite wall panels to each and to the floor anchor to secure said wall portion to the floor.



---

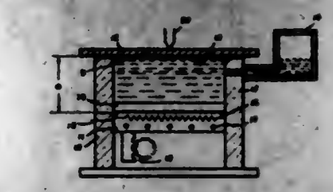
2,769,333

**WALL FACING**

George P. Reintjes, Kansas City, Mo.

Application December 15, 1952, Serial No. 326,037
5 Claims. (Cl. 72—19)

2. The combination with a supporting wall, a series of bolts carried by the wall and arranged in two series of rows in right angular relation, outer and inner clamping flanges longitudinally adjustable on the bolts, the outer and inner flanges of each bolt having supporting flanges projecting toward each other, a plurality of courses of tile, the tile of each course being clamped between the outer end inner clamping flanges with the lower edge of each tile supported by the supporting flanges, and means applying clamping pressure on the clamping flanges.



---

2,769,334

**SIMULATOR FOR TRANSIENT CONVECTIVE HEAT TRANSFER PHENOMENA**

Erich Soehngen, Dayton, Ohio, assignor to the United States of America as represented by the Secretary of the Air Force

Application November 15, 1954, Serial No. 469,066
10 Claims. (Cl. 73—15)
(Granted under Title 35, U. S. Code (1952), sec. 266)

10. Apparatus for simulating and measuring transient convective aerodynamic heat exchange between an aerodynamic heat source and heat sink comprising first means to simulate said aerodynamic heat source, second means to simulate said aerodynamic heat sink, a conductive thermal resistor interposed between said first and second means, means to vary the conductive heat transfer coefficient of said thermal resistor, and means to measure the temperature of said heat sink.

---

2,769,335

**MOUNTING OIL WELL CORES**

William K. Moesnig and Orrin C. Holbrook, Crystal Lake, Ill., assignors to The Pure Oil Company, Chicago, Ill., a corporation of Ohio

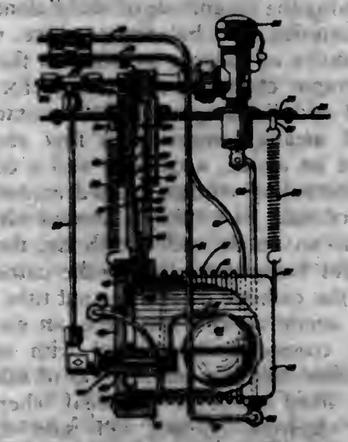
Application March 20, 1953, Serial No. 343,708
1 Claim. (Cl. 73—38)

In a method for determining the fluid flow characteristics of a lithological sample the improvement comprising positioning said sample within a tubular member, introducing a low melting alloy in molten form into the void between said sample and said tubular member, said alloy consisting of 50 percent bismuth, 26.7 percent lead, 13.3 percent tin and 10 percent cadmium and having the characteristic of expanding on solidification, cooling said molten alloy to solidify same, and passing fluid through said sample to measure the fluid flow characteristics thereof.

---

2,769,336

**CAPILLARY ASSEMBLIES FOR FLOW MEASUREMENTS**



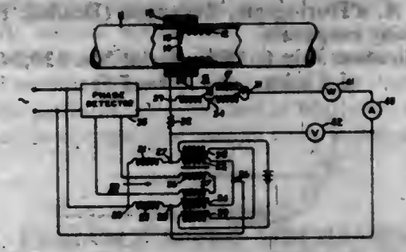
John P. Segers, Crete, and Joseph C. Rhodes, Park Forest, Ill., assignors to Standard Oil Company, Chicago, Ill., a corporation of Indiana

Application September 29, 1954, Serial No. 459,142
7 Claims. (Cl. 73—53)

1. An improved capillary assembly adapted for use in making flow measurements while maintained within a controlled temperature bath which comprises an elongated body externally threaded at both ends, an elongated internally threaded cap disposed about the upper

threaded end of said elongated body, a well fixed to the upper end of said elongated body below the point of engagement by said elongated cap and extending axially upward of said body to surround said cap in spaced relation, said cap having a portion extending beyond the open end of said well thereby the cap may be removed from said body without withdrawing the assembly from

the controlled temperature bath, channel means extending through said body and through said cap, resilient grommet means interposed said cap and the upper end of said body, a capillary mounted in said grommet and extending axially thereof into said channel means, and a vent duct in said cap above the upper end of said capillary means providing free flow from said channel means to the atmosphere.



---

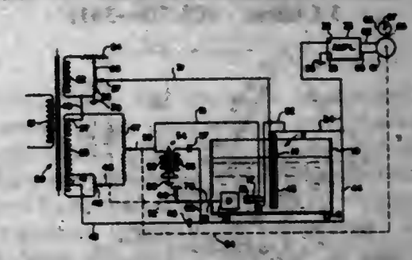
2,769,337

**REBALANCE TYPE FLOW METER**

Theodore A. Rich, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York

Application November 12, 1952, Serial No. 320,059
7 Claims. (Cl. 73—206)

1. A meter for measuring the flow of highly corrosive electrically non-conductive fluids through a section of conduit constructed of a non-magnetic material, said meter including a flexible bellows having one of the ends thereof secured to the inner surface of said section of conduit, a magnetizable plate having an orifice therein secured to the remaining free end of said bellows, said bellows and said orificed plate being disposed in said conduit in flow constricting relation whereby the flow of fluid past said plate produces a displacing movement thereof which is a function of the rate of flow, solenoid means surrounding said conduit and including said plate in the magnetic circuit thereof for applying a magnetic force acting thereon due to the flow of fluid, circuit means for sensing the displacement of said plate, said circuit means including a first bridge network having said solenoid means included in one arm thereof, circuit means connected to said solenoid means for automatically maintaining sufficient current flow through said solenoid means to retain said plate in the zero flow position thereof, said circuit means comprising said first bridge network, a second bridge network having one set of terminals thereof coupled across a source of electric energy and the remaining set of terminals coupled across said first bridge network to energize the same, and an error signal detector circuit having an input coupled to said first bridge network and its output operatively coupled to said second bridge network, and indicator means coupled in circuit relationship with said circuit means for deriving an indication of the current supplied to said solenoid means, said indicator means including instrument means for integrating the fluid flow rate over desired periods of time to thereby obtain an indication of the volume of flow.



---

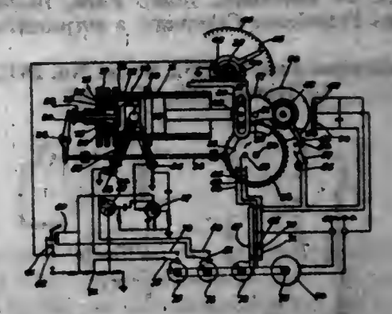
2,769,338

**FUEL GAGE APPARATUS**

Harry M. Hermanson, Golden Valley, Minn., assignor to Minneapolis-Honeywell Regulator Company, Minneapolis, Minn., a corporation of Delaware

Application January 4, 1952, Serial No. 265,010
8 Claims. (Cl. 73—304)

1. Fluid quantity measuring apparatus comprising in combination: a source of voltage; fluid quantity measuring capacitive means connected across a portion of said voltage source and inserted in a container of fluid and providing a signal indicative of the height and dielectric constant of the fluid; compensator capacitive means variably connected across a portion of said voltage source and inserted in the container of fluid and providing a signal opposite to the signal from said measuring capacitive means and of a magnitude indicative of the dielectric constant of the fluid; density responsive means; means variably connecting said density responsive means to said voltage source and controlling the potential of the portion of the voltage source across which said compensator capacitive means is connected; and means adding the two signals together and providing an indication of the weight of the fluid in the container.



---

2,769,339

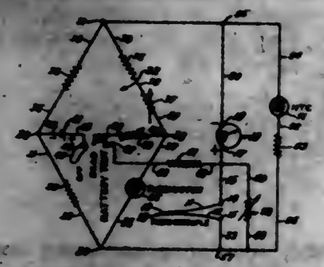
**RELATIVE HUMIDITY INDICATING AND RECORDING APPARATUS**

Harrison D. Brailsford, Rye, N. Y.

Application April 24, 1953, Serial No. 350,854
12 Claims. (Cl. 73—335)

1. In a device for automatically indicating the relative humidity of a gaseous atmosphere, the combination comprising a compression cylinder having a light transmitting aperture in its wall, a piston reciprocable in said cylinder, a mirror mounted in said cylinder in alignment with said aperture, means for maintaining said mirror at ambient air temperature, an intake and exhaust

valve for said cylinder, automatic means for reciprocating said piston in said cylinder through a predetermined cycle of intake, compression and exhaust strokes, means actuated by said automatic means to hold said valve open and to close it upon the commencement of the last compression stroke of said cycle, indicating means, means for coupling said indicating means with said piston for actuation therewith, and photoelectric control means responsive to light reflected from said mirror through said aperture for deactivating said coupling means upon the formation of moisture upon said mirror.



---

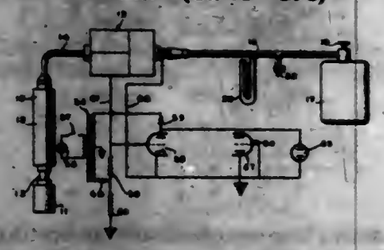
2,769,340

## ROOM TEMPERATURE COMPENSATING CIRCUITS FOR PYROMETERS

Herbert A. Bannister, Elmwood Park, and Leonard E. Carlson, Chicago, Ill., assignors to American Gage & Machine Company, Chicago, Ill., a corporation of Illinois

Application April 12, 1954, Serial No. 422,388
3 Claims. (Cl. 73—361)

1. In a pyrometer, the combination of a thermocouple with a circuit having four resistances in series with each other forming a bridge having two pairs of opposite terminals, said thermocouple being connected to the first pair of opposite terminals, an energizing circuit including a standard cell and a variable resistor connected in series to the second pair of terminals, one of said resistances being subject to room temperature and having a negative temperature resistance coefficient to compensate for changes in the cold junction temperature, the other three resistances being constant, a meter having meter coils connected in series with said thermocouple across the first pair of terminals of said bridge, said latter terminals being shunted by a variable resistance and so connected that the polarity of the bridge output E. M. F. opposes that of the thermocouple, said variable resistance having a negative temperature coefficient adapted to compensate for variations in the resistance of the meter coils with changes in room temperature.



---

2,769,341

## PRESSURE BALANCE INDICATOR

Desiondo R. de Boisblanc, Idaho Falls, Idaho, assignor to Phillips Petroleum Company, a corporation of Delaware

Application June 2, 1952, Serial No. 291,218
5 Claims. (Cl. 73—398)

1. Apparatus for determining the pressure of fluids comprising, in combination, a pressure balance indicator including a casing defining a diaphragm chamber, a diaphragm mounted in said chamber, first and second apertured plate mounted in said diaphragm chamber on opposite sides of said diaphragm, a contact arm insulatedly mounted in said casing, one end of said contact arm extending through the aperture of one of said plates into a closely spaced position with respect to said diaphragm whereby flexure of said diaphragm results in engagement of said diaphragm with said contact arm, means adapted to connect a source of fluid to be measured to one side of said diaphragm chamber, a source of balance pressure, means for varying the magnitude of said balance pressure, means for measuring said balance pressure, means connecting said source of balance pressure to the other side of said diaphragm chamber, and means for indicating engagement of said diaphragm with said contact arm, said last-mentioned means comprising a first electron tube having at least an anode, a cathode and a control grid, a source of alternating voltage applied across the anode and cathode of said first tube, a second electron tube having at least an anode and a cathode, the anode of said second tube being connected to the cathode of said first tube and the cathode of said second tube being connected to the anode of said first tube, an electrical discharge device connected in parallel with said second tube, means connecting the control grid of said first tube to a point of fixed reference potential when said diaphragm is in electrical contact with said contact arm whereby said first tube is conductive during a preselected period of the first half cycles of said applied voltage, said second tube being conductive during a preselected period of the second half cycles of said applied voltage, a voltage dividing network connected in circuit with said voltage source, means connecting the control grid of said first tube to a point on said voltage dividing network when said diaphragm is not in electrical contact with said contact arm whereby said first tube is non-conductive during both half cycles of applied voltage and said discharge device is actuated during a preselected period of said first half cycles of applied voltage.

## ESCAPEMENT MECHANISM

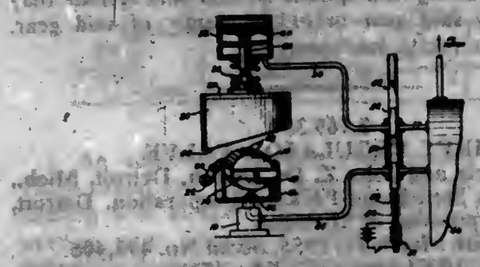
Germaine Dronhot, La Fare-les-Oliviers, France, assignor to Lip S. A. d'Horlogerie, Besançon (Doubs), France, a French body corporate

Application July 6, 1955, Serial No. 520,341
1 Claim. (Cl. 74—1.5)

A clockwork or like precision mechanism containing a continuously rotatable member, an electro-magnetic device for damping gross irregularities of rotation of said rotatable member in order to prevent an untimely rotation or galloping thereof and an oscillating element having a stable frequency comprising a relatively long resilient member securely held at one end, impact means on the other free end of said resilient member and two circumferentially arranged series of protruding stud means in staggered relationship on said rotatable member to exert impulses directly on said impact means for creating a reaction between said oscillating element and said rotatable member to ensure a positive and precise regulation of said member.

---

2,769,343



## CAGING MECHANISM FOR GYROS

James C. Gongwer, Los Angeles, Calif.

Application July 23, 1953, Serial No. 369,973
2 Claims. (Cl. 74—5.12)
(Granted under Title 35, U. S. Code (1952), sec. 266)

1. In a gyroscope having a first gimbal mounted for rotation on a first axis, a second gimbal mounted in the first gimbal for rotation on a second axis normal to the first axis, and a rotor mounted in the second gimbal for spinning on an axis normal to said second axis, caging and releasing mechanism comprising a crank fixed to the second gimbal and normally extending parallel to and spaced

from said first axis, and a cam in the form of a truncated hollow cylinder movable generally along said first axis with its truncated edge movable into contact with said crank to exert rotative and camming torques upon said gimbals.

---

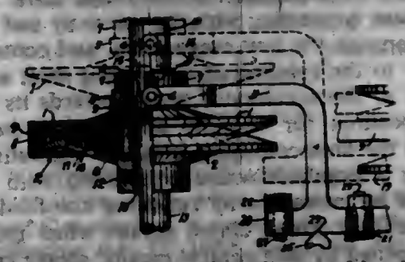
2,769,344

## REMOTE CONTROL MECHANISM FOR TELEVISION RECEIVERS

Aleck Block and Albert Mansbeimer, Los Angeles, Calif.

Application April 27, 1953, Serial No. 351,372
10 Claims. (Cl. 74—10.15)

1. A remote control mechanism for the station selector shaft of a television receiver, comprising: a fixed member surrounding said shaft and restrained against rotation; a rotatable member mounted on said shaft outwardly of said fixed member and defining therewith a housing, said rotatable member being manually engageable to operate said shaft; means within said housing operate to turn said rotatable member predetermined amount relative to said fixed member, thereby to advance said station selector shaft from station-to-station; and a pull cord attached to said means to operate said means from a remote point.



---

2,769,345

## VARIABLE SPEED MECHANISM

George H. Bussenbaugen, Minot, N. Dak.

Application April 10, 1953, Serial No. 347,985
4 Claims. (Cl. 74—230.17)

1. In a variable speed drive the combination which comprises spaced apart opposed pulleys, each of said pulleys having a fixed half and a movable half with a movable half of one pulley opposite the fixed half of the other pulley, annular grooves and fins carried by the inner faces of each pulley with the fins adapted to mate with the grooves carried by the opposed pulley faces, a yoke member connecting the movable halves of the two pulleys adapted to urge the movable faces toward and away from the fixed pulley faces, a control arm pivotally mounted on the yoke member adapted to control the position of the yoke, and belt tension control springs mounted on the control arm on each side of the pivot point and connected to the yoke member so as to apply pressure to the movable pulley faces through the yoke.

---

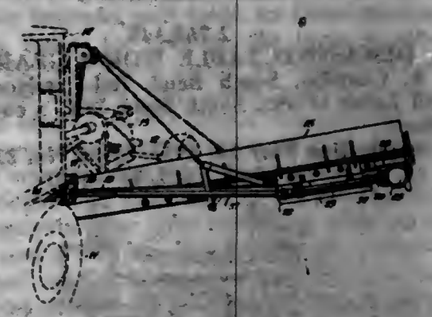
2,769,346

## DRIVE CHAIN

Alexander Flocke, Solingen, Germany

Application November 16, 1953, Serial No. 392,431
Claims priority, application Germany November 17, 1952
2 Claims. (Cl. 74—250)

1. A drive chain for operative engagement with a sprocket wheel, which comprises in combination: a plurality of arch-shaped chain links, each of said chain links having enlarged-end portions with a bore therethrough so as to form a front eye and a rear eye, a plurality of connecting members respectively extending alternately through a front eye and a rear eye of said links for hingedly interconnecting the same, segmental sleeves respectively embracing the alternate front and rear eyes hingedly interconnected by the respective connecting member, said segmental sleeves being designed for engagement with the bottom portion of the tooth spaces of said sprocket wheel, and cap means arranged at each end of said sleeves and interconnected by said connecting members, the arch of each arch-shaped chain link being curved so as to be spaced at all times from the respective tip of the sprocket wheel tooth whose adjacent tooth spaces are engaged by the segmental sleeve embracing the eyes interconnected by the respective arch.



---

2,769,347

## TRANSMISSION GEAR UNIT MOUNTING

Raymond M. Ulrich, Roanoke, Ill., assignor to Ulrich Foundation, Inc., a corporation of Delaware

Original application May 17, 1951, Serial No. 226,839. Divided and this application August 18, 1955, Serial No. 529,276
3 Claims. (Cl. 74—385)

1. The combination of two power transmitting shafts arranged at right angles to each other at all times, one of said shafts having its axis stationary, the other shaft having its axis movable through an angle in an axial plane normal to the axis of said first shaft, a bevel gear transmission unit interconnecting said shafts, said unit having a housing movable about the axis of one of said shafts, a support for said unit comprising a horizontal plate having an aperture adjacent each end, a depending U-shaped

member secured to said plate at each end by a bolt passing through one of said apertures, said U-shaped member supporting a bearing for the stationary axis shaft, each bearing being pivotally supported between the sides of its U-shaped member transverse to the axis of the bearing.

---

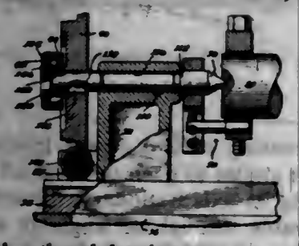
2,769,348

## MANUAL AND POWER ACTUATED STEERING MECHANISM FOR MOTOR VEHICLES

Charles F. Hammond, Grosse Pointe, Mich., assignor to Gemmer Manufacturing Company, Detroit, Mich., a corporation of Michigan

Application July 7, 1954, Serial No. 441,747
4 Claims. (Cl. 74—388)

1. In a manually and power actuated mechanism including a fluid operated motor for the power actuation; a manually rotatable member, a torque transmission between said member and the remainder of the steering mechanism including an internally tooth gear wheel and externally tooth gear wheel of smaller diameter within and in mesh with the aforesaid gear wheel, the axis of the said gear wheels being normally parallel and offset from each other only sufficiently for free rotation of one gear wheel on the other, valve means actuated by a limited planetary movement in response to torque reaction of one of said gear wheels with respect of the other to energize the motor, a floating shaft on which the planetarily movable gear wheel is mounted, a universal pivotal support for the latter shaft between its ends, and means directed in the normal common plane of said axes and transverse thereto for yieldably bearing against said floating shaft to hold said tooth gears in mesh while permitting limited planetary movement.



---

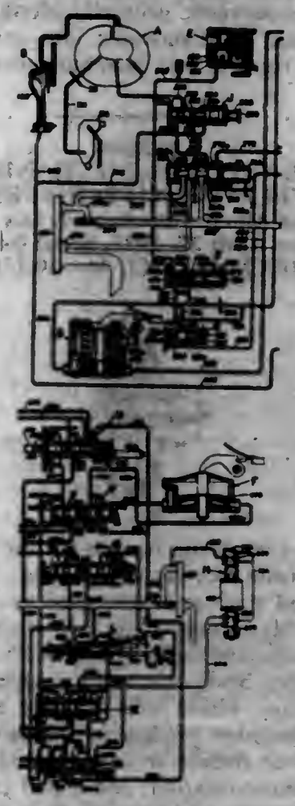
2,769,349

## DISCONNECTABLE WORM GEARING

Otto A. Costello, South Bend, Ind., assignor to South Bend Lathe Works, South Bend, Ind., a corporation of Indiana

Application May 24, 1951, Serial No. 228,100
7 Claims. (Cl. 74—405)

1. In an index head having a support and a spindle rotatably mounted on said support, the improvement comprising a worm wheel keyed to said spindle and slidable axially thereof, a lock nut threaded on said wheel, a lock pin carried on said wheel, said lock nut jamming said pin against said spindle to lock said wheel to said spindle when turned in one direction and releasing said pin when turned in the other direction, a gear carried by said support, said wheel being moved into meshing or non-meshing relationship with said gear by moving said wheel axially along said spindle so that said spindle may be rotated by said gear or independently of said gear, and means to rotate said gear.



---

2,769,350

## SHIFT REGULATOR VALVE

Carroll J. Lucia and John Z. De Lorean, Detroit, Mich., assignors to Studebaker-Packard Corporation, Detroit, Mich., a corporation of Michigan

Application March 31, 1955, Serial No. 498,406
10 Claims. (Cl. 74—472)

1. In a transmission control system for a transmission adapted for use with an accelerator controlled engine including a transmission output shaft, hydraulic operated clutch to engage the high range drive, hydraulic operated brake means to engage and disengage the low range drive, a fluid pressure reservoir, conduit means connecting with the reservoir and the high range engaging means and the brake means to disengage the low range drive, fluid conveying means connecting with the reservoir and the brake means to engage the low range drive, and control means responsive to the rotation of the output shaft and to the movement of the accelerator pedal towards its speed increasing position for opening and closing the conduit means and the fluid conveying means, a regulating system comprising a regulator valve connecting with the conduit means for momentarily retarding the fluid pressure flow to the high range clutch means when the conduit means is opened by said control means, means connecting with the conduit means for retarding the fluid pressure flow to the low range disengaging brake means when the conduit means is opened by said control means, and valve means connecting with the conduit means on opposite sides of said retarding means which is operatively responsive to the movement of the accelerator pedal for bypassing the retarding means when the accelerator pedal is moved a predetermined distance towards its maximum speed increasing position.

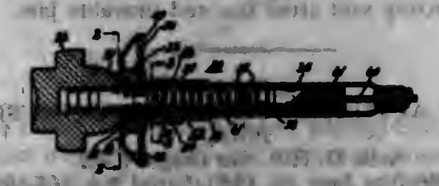
2,769,351

## ADJUSTABLE STEERING POST

Byron A. Serfling, Gardiner, and Omer K. McCaleb, Portland, Oreg.

Application June 13, 1955, Serial No. 515,001
3 Claims. (Cl. 74—493)

1. An adjustable steering post assembly for vehicles which comprises a first steering post section, a second steering post section substantially co-axial with the first steering post section, a hollow first sleeve extending outwardly from one of the steering post sections co-axial therewith, a motor secured to and contained within the first sleeve, screw means connected to and driven by the motor, a second sleeve attached to the other steering post section and co-axial therewith, the second sleeve being splined within the first sleeve and receiving the screw means in threaded engagement, mounting means for mounting the steering post sections and sleeves on the vehicle for longitudinal movement upon actuation of the screw means, and motor control means positioned remotely from the motor for controlling the operation of the latter.



---

2,769,352

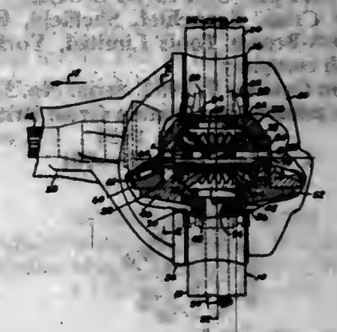
## ROD CONTROLLING MECHANISM

Harold V. Elliott, Anderson, Ind., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application July 26, 1952, Serial No. 301,057
4 Claims. (Cl. 74—503)

1. A control device comprising a tubular fitting, a nylon tube supported within the fitting, having a collar at one end thereof adapted to engage one end of the fitting and having a portion projecting beyond the collar thereof and extending into the fitting, said projecting portion having a slot therein to provide a yieldable portion, a detent on said yieldable portion, a longitudinally extending key on an internal portion of said tubular insert, an operating rod provided with annular grooves and a longitudinal groove extending through said tube, said longitudinal groove receiving the key whereby the rod is prevented from rotating relative to said tube and said detent cooperating with said annular grooves that retain yieldably the rod in a longitudinal adjusting position, and means for holding the collar of said tube and the said end of the said fitting in engagement.

---



2,769,353

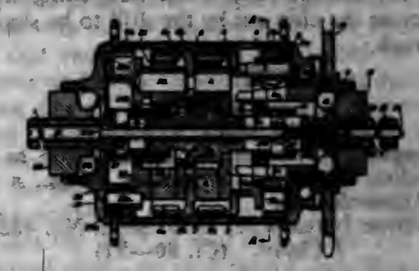
## DIFFERENTIAL GEARING

Edward L. Nash, Ferndale, Mich., assignor to Studebaker-Packard Corporation, a corporation of Michigan

Application July 12, 1954, Serial No. 442,587
5 Claims. (Cl. 74—711)

1. In a differential mechanism having a power rotable differential case containing two axle connected relatively rotatable side gears and an inter-connecting set of pin carried pinions disposed therebetween and revolvable with the case, the combination comprising opposite end portions of said pinion carrying pin each having a pair of flats formed in parallel planes in the outer surface thereof and each coinciding with the plane of the corresponding flat on the other end portion, cam slot guide forming means in the differential case receiving the opposite end portions of the pin so as to continually engage the flats thereof and being diagonally elongated for causing and accommodating limited load impressed tilting travel of the pin and pinions diagonally out of their neutral plane of revolution and about their common

geometric mid-center in a direction tending to spread apart the side gears, and means forming separate pairs of friction engaging surfaces between the differential case and each of said side gears and engageable to establish a reluctant slip drive from the differential case to the individual axles when the pin and pinions are load impressed into either of opposite directions from their neutral plane of revolution.



---

2,769,354

## EPICYCLIC CHANGE SPEED GEARS

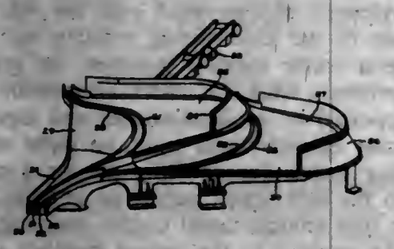
William Brown, Nottingham, England, assignor to Sturmey Archer Gears Limited, Nottingham, England, a British company

Application September 29, 1955, Serial No. 537,498
5 Claims. (Cl. 74—767)

1. An epicyclic change-speed gear for the wheel hub of a bicycle of the kind having primary and secondary epicyclic gear trains coupled together, the primary gear train comprising a fixed sun wheel, an annulus and planet wheels supported by a planet carrier and together forming a primary epicyclic gear train, an input member, input coupling means for coupling the input member selectively to the said planet carrier or annulus, an output member, a first unidirectional output coupling means for coupling the annulus to the output member, said output coupling means being adapted to be rendered inoperative by the input coupling means in one position thereof while the latter couples the input member to the annulus, the secondary epicyclic gear train consisting of a sun wheel, an annulus and planet wheels supported by a planet carrier, a second unidirectional output coupling means for connecting the planet carrier of the secondary gear train to the output member when the first output coupling member is rendered inoperative, characterised in that the planet carrier of the primary gear train is coupled to the annulus of the secondary gear train, and further characterised by selector coupling means for the secondary gear train alternatively adapted for locking the sun pinion of the secondary gear train to a stationary part of the gear or for freeing the said sun pinion and simultaneously locking together two of the aforesaid elements of the sec-

ondary gear train whereby while the first unidirectional output coupling is held inoperative the selector coupling means of the secondary gear train may be operated to provide alternative reduction ratios.

---



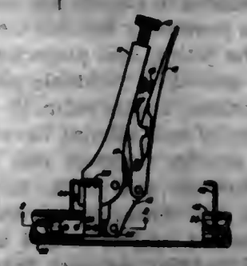
2,769,355
FLUTED CUTTING TOOLS
William Henry Crisp, Rosechief, Sheffield, England, assignor to Firth-Brown Tools Limited, Yorkshire, England, a British company
Application October 7, 1952, Serial No. 313,571
Claims priority, application Great Britain October 12, 1951
1 Claim. (Cl. 77—70)

A cutting tool having a plurality of concave helical flutes extending longitudinally along the surface of the tool and having an upstanding rib of constant height throughout its length extending longitudinally along the trailing face of each flute, considered in relation to the direction of rotation of the tool, said rib being spaced away from the root of the flute by a small uniform distance throughout its length and the surface of each flute between the root thereof and the top of the rib being continuously smoothly concave, and having a radius of curvature substantially smaller than that of the surface of each flute between the top of the rib and the heel of the flute, the height of the rib and the curvature of the concave portion of the surface of the flute between the top of the rib and the root of the flute being selected so that they cause the chip cut by the drill to be sharply bent so as to break.

---

2,769,356
ROLLING MILL REPEATER
Myles Morgan, Worcester, Mass., assignor to Morgan Construction Company, Worcester, Mass., a corporation of Massachusetts
Application January 31, 1955, Serial No. 485,037
1 Claim. (Cl. 80—51)

A repeater for receiving a plurality of rods or the like and separating said rods into diverse paths comprising a first level repeater section and a second level repeater section joined together in side by side relation, each repeater section having a looping table and guard fence, said repeater sections being disposed at different inclinations, an insert at the common entrance of said repeater sections having rod grooves leading from one end to each of said repeater sections at the other end thereof, said insert being inclined with said one end higher than the said other end, mating with said repeater sections, and being removable so that rods may bypass the repeater by passing underneath the same when the insert is removed, and exit guides for each of said repeater sections to provide diverse separate exit paths.

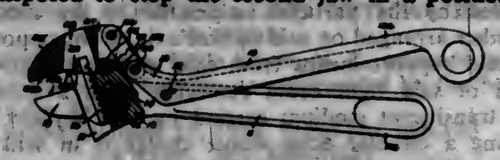


2,769,357
CONNECTOR CRIMPING TOOL WITH PIVOTED AND FIXED JAWS
Wallace A. Moriarty, Overland, Mo., assignor to James R. Kearney Corporation, St. Louis, Mo., a corporation of Missouri
Application April 27, 1954, Serial No. 425,844
4 Claims. (Cl. 81—15)

1. A crimping tool comprising an elongated pole, a bifurcated head mounted fixedly at one end of said pole, a first jaw secured in fixed relation with respect to said head, a second jaw supported for pivotal movement by said first jaw and with respect to said first jaw, said jaws being extended outwardly relative to said head at a substantial angle, and means for moving said movable jaw relative to said fixed jaw, said means comprising a movable arm structure, a pivoted handle, and a link for connecting said arm structure to said handle, and adjusting means for adjusting the initial relative positions of said jaws, said adjusting means comprising a member secured to said arm structure, a cross bar pivotally mounted on said arm structure, adjusting elements supported by said member and contacting said cross bar and link means interconnecting said cross bar and movable jaw.

---

2,769,358
HAND ACTUATED PIPE WALL EXTRUSION TOOL
Arlie D. Hill, San Diego, Calif.
Application June 30, 1953, Serial No. 365,300
8 Claims. (Cl. 81—15)
(Granted under Title 35, U. S. Code (1952), sec. 266)

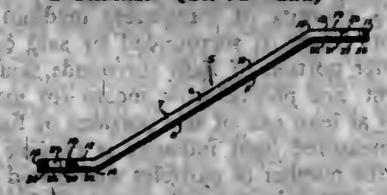


1. An extrusion tool comprising a pair of relatively movable jaws, a pair of spaced outwardly extending protrusions on the opposed outer surfaces of each of said jaws, said jaws having opposed inclined surfaces on the inner portions thereof, a wedge-shaped element slidably mounted between said surfaces, a stationary handle, a movable handle, a bell crank pivotally connected to said stationary handle and said movable handle and to said wedge-shaped element for moving said jaws outwardly with respect to each other when said handles are squeezed together.

---

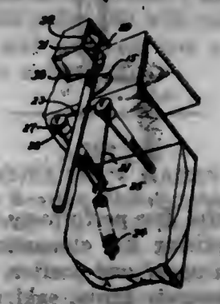
2,769,359
TOGGLE WRENCH
James W. Healy, Medford, Mass.
Application January 20, 1955, Serial No. 483,076
1 Claim. (Cl. 81—64)

A wrench comprising a first handle and a second handle connected together for relative rotation about a common fulcrum, a jaw base fixed to said first handle, a first jaw slidably mounted on said base, a second jaw connected to said base and rotatable thereon toward and away from said first jaw, the latter being slidable toward and away from said second jaw, a stop member disposed to limit the travel of said second jaw toward the first, said jaws having opposed faces and said stop member being disposed to stop the second jaw in a position in



which the jaw faces are substantially parallel, and an arm attached to said second handle, a link having a first swivel connection with said arm and a second swivel connection with said second jaw, said arm and link being disposed to rotate said second jaw toward the first when the handles are pressed together, and said swivel connections and said fulcrum lying substantially in a straight line when said jaws are parallel.

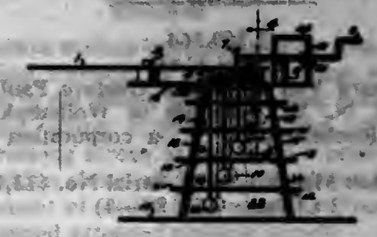
---



2,769,360
ANGULAR WRENCH HEAD HAVING UPWARDLY OPENING SOCKET
Wayne Woodford Cottrell, Terrance, and Edwin E. James, Wilmington, Calif.
Application September 10, 1954, Serial No. 455,228
2 Claims. (Cl. 81—121)

1. In a wrench, a straight handle portion having parallel side edges and upper and lower sides, an elongated socket head on an end of said handle portion, said head being a continuation of said handle portion and being of similar external size and dimensions as said handle portion, said head being angulated relative to said handle portion away from the lower side of the handle portion, said head having an upper side, a nut socket in said head having an open end opening through the upper side of the head, said head having an underside, and a retaining wall partly closing the other end of the socket.

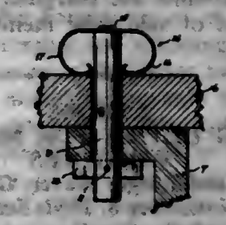
---



2,769,361
RIGID VIBRATOR MUSICAL INSTRUMENT
Jacob T. Kunz, North Hills, Pa., assignor to Schulmerich Electronics, Incorporated, Carillon Hill, Sellersville, Pa.
Application August 6, 1952, Serial No. 302,958
2 Claims. (Cl. 84—1.15)

1. In an electric musical instrument having frame means, mechanical-electrical pick-up means, an amplifier and a loud-speaker connected to the amplifier, the combination including a free-free rod having an aperture extending therethrough transverse to the longitudinal axis of said rod at the node of a desired partial; thread suspending means passing through said aperture; supports mounted on said frame means on either side of said aperture around which said thread means passes in a loop arrangement, said rod being supported such that the thread means, aperture and supports are substantially aligned; and spring means connected at one end thereof to said frame means and at the other end thereof to said thread means opposite the point of support of said rod such that said thread means is maintained at a predetermined tension.

---

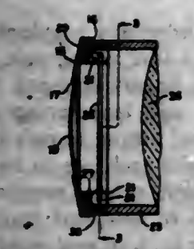


2,769,362
MUSICAL DEVICES
Albert Weinstein, Wilton Woods, Va.
Application March 29, 1954, Serial No. 419,143
1 Claim. (Cl. 84—97)

A musical unit comprising a xylophone with vertically stacked music bars, a leaf spring unit consisting of a plurality of leaf spring fingers stamped from a single piece of spring material, said leaf spring unit being fixed at one end and said leaf spring fingers having vertical projections at the opposite end free to be vertically deflected independently of each other, vertical suspension wires freely hung on each of said leaf spring fingers and supporting a bead under each of said music bars, a removable record disk with radially spaced holes that form a musical pattern, said record disk being mounted on a spindle at its center and being supported along its radius by said leaf spring fingers' vertical projections, said record disk depressing and placing in tension said leaf spring fingers, a hand crank that is pivoted at one end and has a rubber wheel at the other end, said rubber wheel frictionally engaging the periphery of said record disk, a spiral spring that engages the shaft of said hand crank and holds said rubber wheel down on said record disk thus depressing said leaf spring fingers, whereby rotation of said hand crank rotates said record disk around its spindle causing said holes to become successively aligned with said leaf spring fingers' vertical projections permitting said leaf spring fingers to flip said beads up and against said music bars in appropriate sequence to play a musical tune.

---

2,769,363
PIVOTED LOCKING BAR FASTENER HAVING C-SHAPED SPRING HEAD
Alonzo B. Kight, Evanston, Ill.
Application November 7, 1951, Serial No. 255,151
3 Claims. (Cl. 85—3)

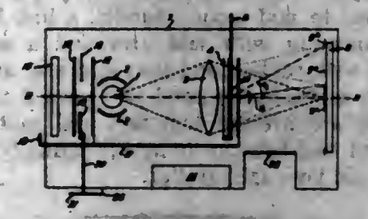


3. A fastener comprising an elongated threadless bolt, the lower portion of said bolt being bifurcated to form two legs projecting axially of said bolt and defining therebetween a slot, a pivot pin in transverse relation to the

axis of said bolt with the end portions thereof being carried by said legs and the intermediate portion thereof exposed in said slot, a locking bar pivotally mounted on said pin and confined within said slot and adapted to lock said bolt in place when desired, said locking bar when in transverse relation to the axis of said bolt, forming projections beyond the circumference of the bolt, a leaf spring fixedly secured to the end of said bolt opposite to the bifurcated end, and said leaf spring forming a convolution at each side of said bolt with the curved portions extending axially of said bolt toward the locking bar and toward the central regions of said bolt, the spring being compressible a distance at least as great as the difference in proximity between the nearest surface of said locking bar and the end of the bolt to which said spring is attached when said locking bar is in locking position and when said locking bar is pivoted from said locking position.

---

**2,769,364**
**LENS CAP**
**Clarence Richard Van Horn and Gustave Paul Pirwitz, Irondequoit, N. Y., assignors to Wollensak Optical Company, Rochester, N. Y., a corporation of New York**
Application March 1, 1954, Serial No. 413,142
2 Claims. (Cl. 88—1)



1. A lens cap for use on the end of an optical tube member having a circumferential V-shaped groove along its internal surface and adjacent its outer end, said lens cap comprising an approximately circular body member having an approximately frusto-conical front face and flat marginal portion on its rear face and a central opening extending therethrough, a disk disposed within said central opening and secured to said body member, a cylindrical flange having one edge secured to said body member in coaxial relationship therewith and a free edge extending rearwardly from said body member, said flange having a diameter less than that of the body member and slightly less than the optical tube member opening, a circumferential groove along the inner periphery of said flange located in a plane spaced from and parallel to said flange free edge, a pair of diametrically opposed radial slots disposed through said flange and extending from said free edge to said body member, and a resilient axle located within said groove and having a rotatable roller adjacent each of its ends, said rollers extending through said slots, said rollers being spaced from said body member marginal portions so as to enable said rollers to engage an outermost portion of a tube member V-shaped groove while the marginal portion is engaged by the outer end of said tube member when said lens cap is positioned.

---

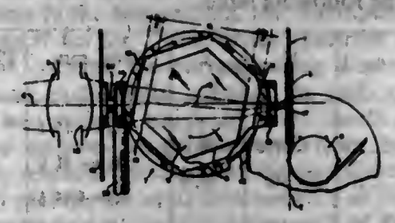
**2,769,365**
**COUNTING DEVICE FOR MICROSCOPIC PARTICLES**
**Hans Loeschcke and Rütger Wever, Gottingen, Germany**
Application November 8, 1951, Serial No. 255,506
Claims priority, application Germany August 22, 1949
6 Claims. (Cl. 88—14)

1. Apparatus for determining the number of microscopic particles, within a given range of sizes, suspended in a translucent medium, comprising, in combination, optical means, including a source of light of a predetermined wave length, for directing a beam of said light along the optical axis of said optical means; support means for supporting a quantity of the translucent medium, with microscopic particles within said range of sizes suspended therein, at a predetermined point along said optical axis in the path of said beam of light so that the latter passes through said medium and is partly diffracted by the particles suspended in the medium; a member arranged on said optical axis on the opposite side of said support means from said source of light in the path of said light beam emerging from a quantity of the translucent medium carried by said support means, having a circular edge whose center is in said optical axis, said last-mentioned member being located from said

support means at an optic axis distance which forms with a straight line extending from said predetermined point to a point on said circular edge an angle within and outside of which the intensity of said light beam is independent of the size of the particles within said given range of sizes while being dependent on the quantity of the particles, whereby an inner portion of the light emerging from a quantity of translucent medium carried by said support means is surrounded by said circular edge and an outer portion of light surrounds said inner portion of light; and photoelectric means for measuring the intensity of at least one of said portions of light, whereby the thus measured light intensity is capable of directly indicating the number of particles within said given range of sizes suspended in the translucent medium.

---

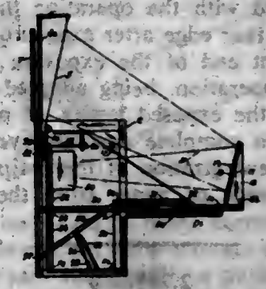
**2,769,366**
**APPARATUS FOR SPECTROGRAPHIC ANALYSIS**
**Minora Hozumi, Iowa City, Iowa, assignor to The State of Iowa, for the benefit of the State University of Iowa, Iowa City, Iowa, an educational institution of Iowa**
Application April 1, 1952, Serial No. 279,791
8 Claims. (Cl. 88—14)



7. A burner useful for performing analysis by flame spectroscopy comprising an elongated tubular mixing chamber having an upper end portion defining a tapered outlet slot which extends across said upper end portion at an inclined angle with respect to the longitudinal axis of said tubular mixing chamber, said outlet slot having an upper end and a lower end, the upper end of said outlet slot being wider than the lower end of said outlet slot, means connected to said mixing chamber to admit material to be analyzed to said mixing chamber below the upper end portion of said mixing chamber, and a housing surrounding said outlet slot, said housing including means to view flame from said outlet slot.

---

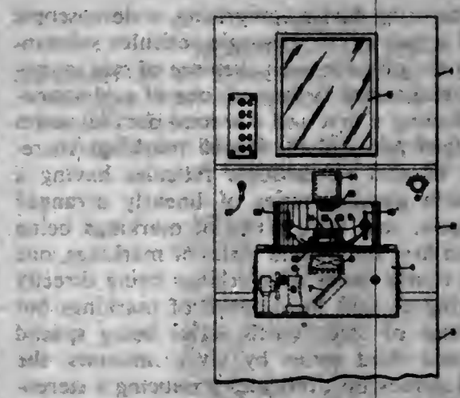
**2,769,367**
**DEVICE FOR COMPENSATING OPTICAL IMAGE MOTION**
**Gerhard Schwesinger, Little Silver, N. J., assignor to the United States of America as represented by the Secretary of the Army**
Application June 27, 1952, Serial No. 296,103
2 Claims. (Cl. 88—16.8)
(Granted under Title 35, U. S. Code (1952), sec. 266)



1. An image motion compensator for eliminating optical aberrations comprising at least two plane-parallel refracting elements of two different refractive indices, said elements being arranged in abutting relationship along the optical axis of the compensator and being rotatable as a unit about an axis perpendicular to and lying on the optical axis of the compensator to provide a two-element rotating refractor for refracting an image forming light beam, a two-element variable optical wedge disposed on each opposite side of said rotating refractor along said optical axis in position to pass said image forming light beam, each of said wedges comprising a movable plano convex lens, the convex surface of which lies on a circle having its center on the axis of rotation of said tilting refractor, each of said wedges further comprising a fixed plano concave lens, the concave surface of which lies on a circle whose radius is substantially equal to the radius of said first-mentioned circle and whose center coincides with the center of said first-mentioned circle, the refractive index of each of said lenses being the same but different from the refractive indices of said rotating refractor, the refractive index of one element of said two-element refractor being substantially greater than the refractive index of said lenses and the refractive index of the other element of said refractor being less than the refractive index of said lenses, means for rotating said refractor and said movable lenses in synchronism, said variable optical wedges refracting said image beam in opposite directions whereby the result of refraction by said wedges and by said refractor is a lateral displacement of said image beam, said wedges further providing a medium embracing said tiltable refractor having a refractive index with respect to which one element of said refractor has a relative index of refraction greater than unity and with respect to which the other element of said refractor has a relative index of refraction less than unity.

---

**2,769,368**
**PROJECTION CABINET**
**Alvin Bourist, Philadelphia, Pa.**
Application May 18, 1953, Serial No. 355,692
2 Claims. (Cl. 88—24)



1. A projected picture viewing cabinet containing a picture projecting means, a reflective surface, and a rolled opaque viewing screen, said reflective surface being movably attached to and supported by said cabinet to provide horizontal movement of said reflective surface from and to a position within said cabinet to and from a predetermined position in front of said cabinet, said opaque viewing screen having one edge supported to permit vertical movement of said opaque viewing screen to and from an unrolled extended viewing position above said cabinet, means for attaching said picture projecting means within said cabinet to project a light beam therefrom upon said reflective surface, whereby the light beam is reflected from said reflective surface upon said opaque viewing screen,

said reflective surface having means thereon for extending longitudinal traverse of said light beam to provide enlargement of the image, interconnecting positioning means within said cabinet to provide vertical unrolling of said opaque viewing screen to and from a predetermined elevated position above said viewing cabinet when horizontal movement of said reflective surface from and to said predetermined extended position occurs.

---

**2,769,369**
**MICROFILM PRINTER**
**Frank E. Oller, Cleveland, Ohio, assignor to Oscar Smith, Cleveland, Ohio**
Application November 16, 1953, Serial No. 392,147
5 Claims. (Cl. 88—24)

1. A combined photographic film projector and printer of sensitized paper exposed to the projected image of the film comprising a housing, a light source, an optical system including lenses and mirrors, a film carrier having means for feeding film through the optical system to intercept light beams from the light source, a translucent screen constituting a part of one wall of the housing, the mirrors of the optical system including a pair of angularly disposed stationary mirrors for projecting an enlarged image of said film on the screen to be viewed from the exterior of the housing, the film carrier being mounted on the housing so as to be adjustable in three planes of movement for adjusting and positioning the image on the screen, a stationary table for receiving sensitized paper, a manually movable mirror adjustable into and out of, a position to intercept the light beam from one of the stationary mirrors to the screen so as to project the image of the film toward the exposure table, a dark box and a reel therein for supporting a roll of sensitized paper, a main motor and gear operated feed roll means driven thereby for positively drawing the paper from the roll across the exposure table in predetermined lengths per cycle of operation of the main motor under switch control, automatic time delay switch

means in circuit with the main motor for interrupting the operation of the paper feeding means for a predetermined time interval for exposure to the film image, the paper feed roll means including rolls at the forward and rear ends of the exposure table in the path of travel of the paper, paper severing knife arranged at the rear end of the exposure table adjacent the paper reel in the dark box and driven by the gear train for feeding the paper and so correlated with the operation thereof as to cut the paper at the rear edge after exposure, the paper feed rolls at the front end of the exposure table, after the paper severing operation, being adapted in sequence to positively draw the exposed length of paper off of the exposure table to complete a single cycle of operation initiated by the energization of the main motor without the further advance of paper from the reel onto the exposure table.

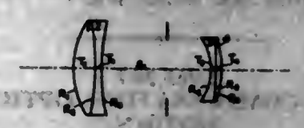
## STEREOSCOPIC MICROSCOPE FOR MEASURING DEPTHS

Russell E. Tompkins, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York

Application December 15, 1954, Serial No. 475,483
2 Claims. (Cl. 88—39)

1. A depth measuring device comprising, a stereoscopic microscope, and a pair of stereoscopic reticules substantially disposed in the plane in each eyepiece of said microscope where the real image is formed, one of said stereoscopic reticules having a first and a second parallel series of linearly arranged and equally spaced markings thereupon, the other of said stereoscopic reticules having a third and a fourth parallel series of linearly arranged markings thereupon, said third series of markings being identical with said first and second series of markings, one marking of said fourth series of markings being directly under one marking of said third series of markings but the other markings of said fourth series being spaced from those of said third series by given amounts, the markings on said stereoscopic reticules producing a stereoscopic image of two substantially linear reference scales lying in different but intersecting planes and having corresponding points thereon, one reference scale being formed by said first and third series of markings on said reticules and the other reference scale being formed by said second and fourth series of markings, said other reference scale intersecting a plane passing through the top and a plane passing through the bottom of an object whose depth is to be measured, the differing spacings of said fourth series of markings on said other stereoscopic reticule being chosen such that corresponding points on said two reference scales appear displaced from one another by known depths.



2,769,371

## TELEPHOTO OBJECTIVE LENS COMPRISING FOUR ELEMENTS

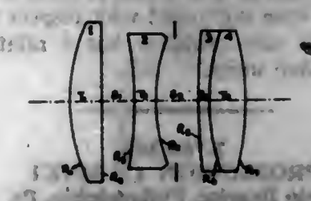
David C. Gilkeson, Irondequoit, N. Y., assignor to Wollensak Optical Company, Rochester, N. Y., a corporation of New York

Application July 25, 1955, Serial No. 523,995
1 Claim. (Cl. 88—57)

A telephoto objective consisting of four lens elements grouped to form a positive meniscus doublet with its concave side toward the rear and a negative meniscus doublet with its concave side toward the front and arranged behind and axially alined with said positive doublet, the two lens elements of the positive doublet being cemented

to each other, the two lens elements of the negative doublet being cemented to each other, the characteristics of the respective lens elements and their spatial relationship to each other being substantially in accordance with the data in the following table:

| Lens | N | V | Radii, mm. | Thicknesses, mm. |
|---|---|---|---|---|
| | | | $R_1$=+18.1 | |
| 1 | 1.5725 | 56.8 | | $T_1$=4.2 |
| | | | $R_2$=−51.0 | |
| 2 | 1.649 | 33.8 | | $T_2$=1.6 |
| | | | $R_3$=+44.5 | |
| | | | | $S_1$=21.7 |
| | | | $R_4$=−11.3 | |
| 3 | 1.800 | 67.0 | | $T_3$=1.1 |
| | | | $R_5$=−58.3 | |
| 4 | 1.605 | 43.6 | | $T_4$=1.1 |
| | | | $R_6$=−19.5 | |



wherein the lens elements are numbered in order from front to rear in the first column, the corresponding refractive indices N for the D line of the spectrum are given in the second column, the corresponding dispersive indices V are given in the third column, the radii of curvature R of the lens surfaces are given in the fourth column, the respective surfaces being numbered from front to rear and being respectively identified by the subscript numeral used with each R, the axial thicknesses T of the respective lens elements and the axial thicknesses S of the air spaces between lens elements being given in the fifth column, the respective lens elements and air spaces to which the values of T and S apply being numbered from front to rear and being respectively identified by numerical subscripts used with T and S, the values of R, T, and S all being expressed proportionately in millimeters per 100 millimeters of equivalent focal length of the entire lens, the plus and minus values of R indicating curved surfaces which are respectively convex and concave toward the front of the lens.

2,769,372

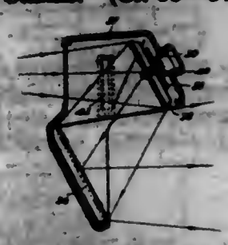
## THREE COMPONENT OBJECTIVES FOR PHOTOGRAPHIC AND PROJECTION PURPOSES

Alan A. Cook, Rochester, and David C. Gilkeson, Irondequoit, N. Y., assignors to Wollensak Optical Company, Rochester, N. Y., a corporation of New York

Application July 25, 1955, Serial No. 523,994
2 Claims. (Cl. 88—57)

1. An objective lens comprising three components in axial alinement with each other, the front and middle components each being simple lens elements air spaced from each other and the rear component consisting of two lens elements cemented to each other to form a cemented doublet, the lens elements and their spatial relationship to each other being substantially in accordance with the data in the following table:

| Lens | N | V | Radii | Thicknesses |
|---|---|---|---|---|
| | | | $R_1$=+ 38.0 | |
| 1 | 1.638 | 55.0 | | $T_1$=6.6 |
| | | | $R_2$=∞ | |
| | | | | $S_1$=6.9 |
| | | | $R_3$=− 75.0 | |
| 2 | 1.620 | 36.0 | | $T_2$=4.2 |
| | | | $R_4$=+ 36.0 | |
| | | | | $S_2$=8.7 |
| | | | $R_5$=+344.0 | |
| 3 | 1.605 | 38.0 | | $T_3$=2.2 |
| | | | $R_6$=+ 44.0 | |
| 4 | 1.700 | 48.0 | | $T_4$=7.2 |
| | | | $R_7$=− 55.1 | |



wherein the lens elements are numbered in order from front to rear in the first column, the corresponding refractive indices N for the D line of the spectrum are given in the second column, the corresponding dispersive indices V are given in the third column, the radii of curvature R of the lens surfaces are given in the fourth column, the respective surfaces being numbered from front to rear and being respectively identified by the subscript numeral used with each R, the axial thicknesses T of the respective lens elements and the axial thicknesses S of the air spaces between lens elements being given in the fifth column, the respective lens elements and air spaces to which the values of T and S apply being numbered from front to rear and being respectively identified by numerical subscripts used with T and S, the values of R, T, and S all being expressed proportionately in millimeters per 100 millimeters of equivalent focal length of the entire lens, the plus and minus values of R indicating curved surfaces which are respectively convex and concave toward the front of the lens.

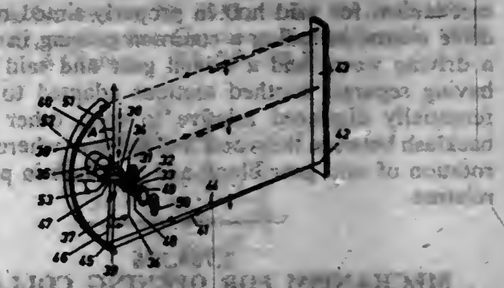
2,769,373

## OPTICAL REFLECTING ANAMORPHOTIC DEVICE FOR USE WITH OBJECTIVE LENS SYSTEMS

Albert Bouwers, The Hague, Netherlands, assignor to N. V. Optische Industrie "de Oude Delft," Delft, Netherlands

Application January 22, 1954, Serial No. 405,550
Claims priority, application Netherlands June 10, 1953
29 Claims. (Cl. 88—57)

1. An optical reflecting anamorphosing device for use with an objective lens system and comprising a housing, means supporting a plurality of reflecting surfaces by said housing in operative alignment, at least one pair of said surfaces comprising a convex and a concave reflecting mirror surface with substantially parallel axes and being so positioned and dimensioned that a beam of light of circular cross-section incident on one of said surfaces is reflected to the other of said surfaces as a substantially parallel emergent beam of elliptical cross-section before leaving the device, said surfaces being positioned to have the shortest distance between their surfaces approximately equal to half the difference between the radii of the surfaces, and with the focal lines of the two surfaces approximately coincident and including at least one curved surface and with the axes of generation of said surfaces being substantially parallel to each other, entrance aperture means in said housing for admitting the light beam to said surfaces, whereby an object on one conjugate is compressed in a desired order on the other conjugate.

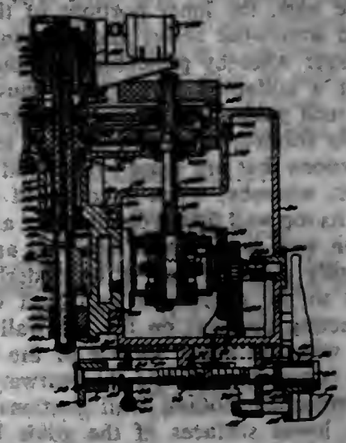


2,769,374

## ELECTRICAL LIGHT SCREEN

Erwin Sick, Vaterstetten, near Munich, Germany

Application October 18, 1952, Serial No. 315,460
Claims priority, application Germany October 19, 1951
3 Claims. (Cl. 88—74)



1. An electrical light screen, comprising a sender emitting a bundle of light rays, a rotary polygonal mirror prism receiving said ray bundle, a parabolic cylindrical mirror limiting said screen on one side, said rotary polygonal mirror prism being rotated about an axis which is substantially parallel to the focal line of the parabolic mirror and is located at such distance therefrom that the edges of the mirror prism in the course of its rotation at least substantially coincide with said focal line, said mirror prism transmitting light to said parabolic mirror, a mirror limiting said screen on the other side and receiving light from said parabolic mirror, the last-mentioned mirror reflecting said light back to the parabolic mirror and the parabolic mirror reflecting the last-mentioned light back to the mirror prism, and a light receiving releasing device, said device receiving light reflected from said parabolic mirror upon said mirror prism.

2,769,375

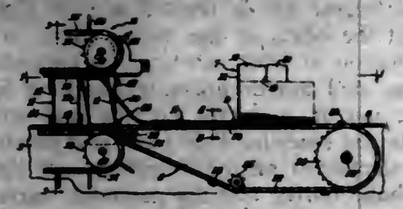
## HOBBING MACHINE

Alexander D. F. Moncrieff, Detroit, Mich., assignor to Michigan Tool Company, Detroit, Mich., a corporation of Delaware

Application March 28, 1951, Serial No. 217,999
4 Claims. (Cl. 90—4)

1. A gear-hobbing machine comprising a base, means for mounting and rotatably supporting a gear blank on said base, a slide on the base movable to and from said gear blank, a hob carrier mounted on the slide movable therewith and rotatably adjustable about a fixed axis to position the hob in accordance with the lead of the teeth on said gear blank, a rotary-drive mechanism for said gear blank, a rotary-drive mechanism for said hob including a first worm, and a first worm gear driven by said first worm, said first worm being carried by the slide and located on the same axis as the hob carrier, said first worm gear being carried by and movable with said hob carrier and constantly engaging said first worm in all rotatably adjusted positions of the hob carrier, means for varying the angular

position of said carrier including a second worm gear fixed to said carrier and mounted for rotation coaxially with said first worm, and a second worm carried by said slide and actuable to drive said second worm gear and a single drive means for rotatably operating the rotary drive mechanism for said gear element and the rotary-drive mechanism for said hob in properly timed relation, said drive means including a common gearing in the form of a driving worm and a driven gear and said driven gear having separate toothed sections adapted to be circumferentially displaced relative to each other to take up backlash between the worm and the gear whereby to assure rotation of said gear blank and said hob in proper timed relation.



---

2,769,376

## MECHANISM FOR OPENING COLLAPSED TUBULAR CARTONS

Francis A. Childrey, Jr., and Joseph H. Walter, Wayne, Pa., assignors to Container Corporation of America, Chicago, Ill., a corporation of Delaware

Application May 31, 1955, Serial No. 512,084
9 Claims. (Cl. 93—53)

1. Mechanism for opening or expanding collapsed, tubular cartons of the type having interconnected top, bottom and side walls in which the top and bottom walls have outwardly projecting portions, such mechanism comprising in combination, a conveyer member including an element adapted to engage and advance a collapsed carton and move it along a predetermined path, and spaced guide bars disposed along the conveyer, the spacing of the guide bars being such that the outwardly projecting portions on the top wall of a collapsed carton can be supported upon and move along the respective spaced guide bars, the inner portions of the guide bars being spaced somewhat above and substantially parallel to the conveyer whereby projecting portions on the bottom wall of a collapsed carton may move along said path below such guide bars, such guide bars each having symmetrically formed, upwardly inclined sections joined with the portions that are spaced from and parallel with the conveyer, whereby, when a collapsed carton is advanced with its top wall forwardly disposed and in an overlying position with respect to a side wall and its bottom wall rearwardly disposed and in an underlying position with respect to the other side wall, and with the outwardly projecting portions on the top wall coming into engagement with the upper surface of the upwardly inclined guide bar sections, while the rearwardly disposed, outwardly projecting bottom wall portions are moving between the lower surfaces of the guide bars and the conveyer, the carton will move toward expanded condition.

2,769,377

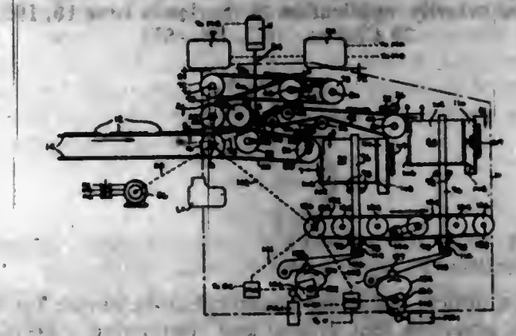
## EXPLOSIVE CARTRIDGE END CLOSURE APPARATUS

Uel P. Jennings, Wilmington, Del., and Edward F. Lewis, Martinsburg, W. Va., assignors to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

Application December 13, 1955, Serial No. 552,851
4 Claims. (Cl. 93—55.1)

1. In an apparatus for producing tubular explosive cartridge shells by closing one end of a tube, the combination comprising a continuous inclined support structure for pre-cut lengths of tube, said support structure being disposed from beginning to end at an acute angle to the horizontal whereby said pre-cut lengths of tube may roll downward along the length of the upper side of said support structure, a mechanical disc inserting mechanism at one side of said support structure adapted to insert a disc into one end of a length of tube while said tube is momentarily held stationary, a glue distributing mechanism opposite said disc inserting mechanism adapted to apply glue on the inside edge of the other end of said tube during the disc insertion, movable stop means for intermit-

tently arresting the downward roll of said lengths of tube to momentarily hold them stationary while the disc is being inserted in and the glue is being applied to the ends of the tube, a horizontally reciprocatable mandrel adjacent to said disc inserting mechanism adapted to press said inserted disc to the glue containing end of the tube after the tube has rolled down the inclined support structure past the disc inserting and glue applying mechanisms, a crimping head opposite said mandrel and mating therewith when the mandrel is at its innermost position, and motive means for operating said disc inserting mechanism, said glue distributing mechanism, and said mandrel.



---

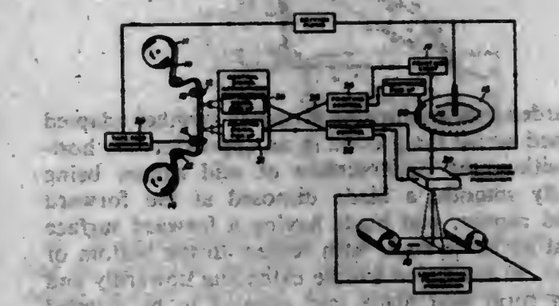
2,769,378

## MECHANISM FOR COUNTING AND STACKING MAGAZINES AND THE LIKE

Theodore B. Jochem, Wauwatosa, Wis., assignor to Cutler-Hammer, Inc., Milwaukee, Wis., a corporation of Delaware

Application January 2, 1953, Serial No. 329,486
17 Claims. (Cl. 93—93)

1. A device for counting, stacking in bundles, and delivering bundles of flat articles received continuously comprising, means for counting the articles as received, means for conveying said articles selectively to a plurality of collecting baskets, said collecting baskets being vertically movable from article receiving positions to delivery positions, a bundle delivery conveyor alined with said baskets and disposed below their article receiving positions for removing bundles from said baskets in said delivery positions, separate means for moving said collecting baskets from said article receiving positions to said delivery positions, and selecting means controlled by said counting means for causing one of said basket moving means to move one basket to its delivery position and back to its article receiving position while the other basket moving means holds its basket in article receiving position.



2,769,379

## CHARACTER POSITIONING MECHANISM

Walter E. Peury, Pottsville, N. J., assignor to Time, Incorporated, New York, N. Y., a corporation of New York

Application May 22, 1952, Serial No. 289,411
21 Claims. (Cl. 95—4.5)

1. In justifying apparatus, the combination of a first pair of log tape wheels carried, respectively, by one and another shafts and coupled together to provide a logarithmic motion transmission ratio from the former to the latter shaft, means normally maintaining said shafts in an initial position corresponding to the length of a line of characters, a second pair of log tape wheels carried, respectively, by one and another shafts and coupled together to provide a logarithmic motion transmission ratio from the former to the latter shaft, means for coupling and uncoupling said other shaft of said first pair and said other shaft of said second pair of log tape wheels, means operable when said other shafts are uncoupled for moving said shafts of said first pair of log tape wheels from said initial position as a function of the widths of the characters to be printed in a line, and means operable when said other shafts are uncoupled for moving said shafts of said second pair of log tape wheels as a function of the number of word spaces in said line of characters said movements when completed and said other shafts thereafter coupled together providing therethrough and between said one shafts a motion transmission ratio representing the size of justified word spaces along said line.

---

2,769,380

## CAMERA SHUTTER AND FILM RELEASE

Myron S. Rapaport, New Rochelle, N. Y.

Application December 21, 1955, Serial No. 554,432
8 Claims. (Cl. 95—31)

1. A removable attachment for cameras comprising a plate, means at one end of said plate for attaching the same to a side of said camera, said side having thereon a rotatable member for advancing film in said camera and a central pin for releasing a shutter when said pin is depressed, a band for embracing said rotatable member, a coil spring having the outer end thereof attached to said band, the inner end of said spring being attached to a central stop, a ratchet fixed to said stop and a pawl on said plate cooperating with said ratchet, a central plunger mounted on said plate in longitudinal alinement with said pin and adapted to be moved transversely of said plate to depress said pin.

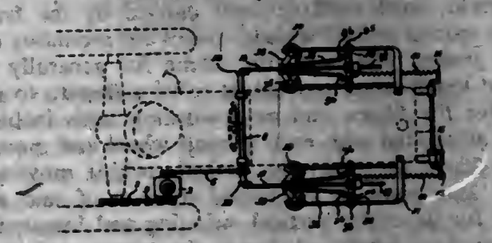
2,769,381

## APPARATUS FOR DAYLIGHT DEVELOPING, FIXING AND WASHING OF LIGHT SENSITIVE STRIPS

Michael Lezjak, deceased, late of Goeppingen, Germany, by Babette Viktoria Lezjak, executrix, Goeppingen, Germany

Application November 19, 1951, Serial No. 257,167
Claims priority, application Germany November 25, 1950
4 Claims. (Cl. 95—90.5)

1. A daylight developing tank for roll film strips comprising a horizontal preliminary roll film chamber, an adjacent horizontal cylindrical developing chamber for containing a treating solution, a partition between said chambers over whose upper edge the film passes during its transfer from said preliminary to said developing chamber, a light-tight cover for said tank covering both said chambers, a reversibly rotatable axle horizontally mounted in the circular side walls of said horizontal cylindrical developing chamber, said axle including a centrally located groove of a width along said axle at least equal to the width of said film strip, said groove providing a substantially flat clamping surface in a plane parallel to the axes of said axle, a clamping means mounted upon said flat clamping surface for securing the leading end of a film strip to said surface, a holding device mounted through said cover adjacent the upper edge of said partition for securing the trailing end of said film strip to said upper edge of said partition, the distance between the circumference of said axle and the surrounding inner walls and cover of said developing chamber being substantially equal to the diameter of said axle to insure consistent formation of a wandering bow upon reversed rotations of the axle, and external winding means connected to said axle for rotating said axle to draw the film strip from said preliminary chamber over said partition through said treating solution and when said trailing end of said film strip is secured between said holding device and said upper edge of said partition to form said wandering bow upon reversed rotations of said axle whereby said film strip is agitated through said treating solution.



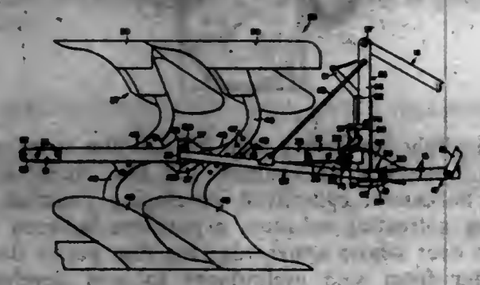
---

2,769,382

## CHOPPING DEVICE

George J. Vacek, Richmond, Tex.

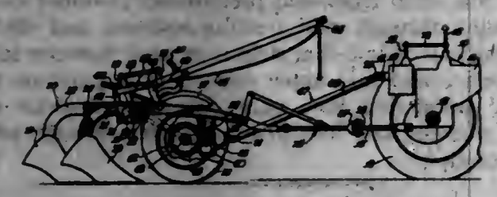
Application June 26, 1953, Serial No. 364,314
4 Claims. (Cl. 97—10)



3. In a cotton chopper, a wheeled vehicle, a reciprocating beam mounted on said vehicle, a means for imparting movement to said beam, a bell crank pivotally secured to said vehicle, means for constantly urging said bell crank into one position and means on said beam for contacting said bell crank and moving same in the other direction, a pair of cutting blades mounted on said vehicle and a connecting rod between said bell crank and said cutting blades for oscillating said cutting blades and

means for selctively moving said bell crank into and out of operative connection with said beam while the chopper is in operation.

---



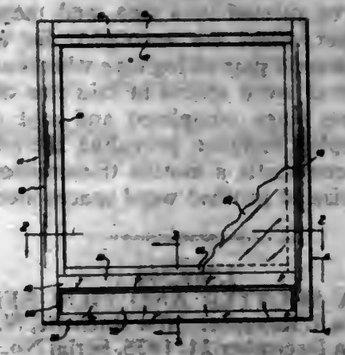
2,769,383
TWO-WAY PLOW WITH DRAFT TRANSMITTING LATCH
Herman E. Altgelt, Moline, Ill., assignor to Deere & Company, Moline, Ill., a corporation of Illinois
Application June 29, 1953, Serial No. 364,787
13 Claims. (Cl. 97—24.5)

11. A two-way plow comprising the combination of a main frame, a set of right- and left-hand plows including a plow frame rotatably mounted on said main frame about a generally transverse axis, and draft-transmitting means carried by the forward part of said main frame and releasably engageable with the forward portion of said plow frame in either position of the latter in said main frame, said draft-transmitting means including hook means having a portion which is releasably engageable behind a generally vertically disposed surface on the forward portion of the plow frame for transmitting draft pull to the latter.

---

2,769,384
PLOW
John Selzer, Fort Wayne, Ind., assignor to International Harvester Company, a corporation of New Jersey
Application November 16, 1953, Serial No. 392,297
4 Claims. (Cl. 97—46.21)

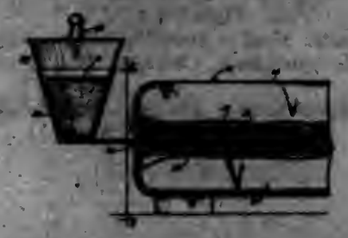
1. The combination with a tractive vehicle having drive wheels and a power take-off, of a trail-bound implement having a supporting frame connected to the vehicle for lateral and vertical swinging movement relative thereto; earth-working tools carried by the frame; laterally spaced ground wheels; means for mounting each of said ground wheels on the frame for generally vertical and longitudinal movement relative thereto to raise and lower the frame and earth-working tools including an arm associated with each ground wheel and mounted on said frame for generally vertical rocking movement, a crank axle pivotally connected to each of said arms adapted for generally vertical swinging and longitudinal movement as a whole relative to the frame, said implement wheels being mounted on the crank axles, and link means interconnecting said crank axles and said frame; and means for driving said implement wheels at the same peripheral speed as the vehicle drive wheels in all positions of the implement frame relative to the vehicle comprising drive means on said implement wheels, transmission means on the frame engageable with the wheel drive means, and a driving connection between the power take-off and said transmission means.



2,769,385
GARDEN TOOL
Joel A. E. Holm, Beatrice, Nebr.
Application October 19, 1953, Serial No. 386,921
3 Claims. (Cl. 97—58)

1. A garden tool comprising a runner member adapted to be pushed across the ground in an approximately horizontal position, the undersurface of said runner being substantially smooth, a blade disposed at the forward end of said runner, said blade having a forward surface disposed at an acute angle with respect to the bottom of said runner, an elongated handle extending upwardly and rearwardly form said blade and adapted to be gripped by an operator at its upper end, a resilient member attached to the upper side of said runner and curving first forwardly and upwardly and then rearwardly and upwardly therefrom, the upper end of said resilient member being attached to said handle, and in which adjustable means is provided for connecting the rearward end of said runner with said handle for adjusting the angular relationship of said handle with respect to the bottom of said runner, means securing said blade to said handle.

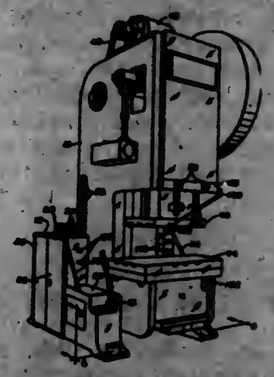
---



2,769,386
WINDOW VENTILATOR
George Silversmith, St. Petersburg, Fla.
Application May 11, 1954, Serial No. 428,883
13 Claims. (Cl. 98—38)

1. A window ventilator comprising an elongated hollow box positioned within the lower end of a window frame, said box consisting of an upright front wall having an upright enlarged air inlet aperture therethrough, a horizontal flange projecting inwardly from said front wall above said aperture, an upright rear wall of less height than said front wall, an upwardly and rearwardly extending bottom wall interconnecting said front wall at the bottom of its aperture with said rear wall, a horizontal top wall extending rearwardly of said front wall forming a window sill and with its rear longitudinal edge parallel to the plane of said frame being spaced forwardly of said rear wall defining an elongated air inlet opening, spaced upright supporting walls at opposite ends of said front, rear, top and bottom walls completing the box construction, a rectangularly shaped screen within said box supported at its front longitudinal edge upon said flange and secured along its rear longitudinal edge to said rear wall adjacent its lower end, and a closure plate positioned within said box slidably supported upon said side walls adjacent said top wall and movable thereunder normally closing said air inlet opening and slidable towards and away from the front wall for controlling the flow of air through said inlet opening.

2,769,387
BUTTER MELTING ATTACHMENT FOR WAFFLE IRONS AND LIKE APPLIANCES
Archie V. Panich, Lawton, Okla.
Application June 12, 1953, Serial No. 361,183
3 Claims. (Cl. 99—339)



1. In an electrical waffle iron, a lower section containing an electrical heating element, a lower grid on said lower section overlying and spaced above said heating element, a flat heat conductive plate overlying said heating element and positioned between the heating element and said grid, said plate having an outer end, a heat conductive extension on said outer end projecting laterally outwardly from said lower section, said extension having an outer end, and a heat conductive outer cup mounted on and in heat conductive relation to the outer end of the extension and in laterally spaced relation to said lower section.

2,769,389
CABINET TYPE PRESS LEG
Reuben E. Wiseman, Minster, Ohio, assignor to The Minster Machine Company, Minster, Ohio, a corporation of Ohio
Application August 18, 1954, Serial No. 450,728
9 Claims. (Cl. 100—231)

1. A base arrangement for an inclinable press having a press frame and operating systems with components thereof on said press frame and comprising spaced leg members having means pivotally supporting the press frame therebetween, each leg member being formed to define a compartment of substantial size opening outwardly thereof to house control units of said systems mounted therein, door means hinged to said leg members for closing said compartments, flexible connecting means between said compartments, control units and components on said press frame, a tubular brace member extending transversely between said leg members and rigidly connected therewith, and the inner walls of said compartments being provided with apertures registering with the ends of said tubular brace member with said flexible connections passing therethrough and housed in said tubular brace.

2,769,390
WATER COOLED ANNULAR SEAL
Elmer F. Helmbrecht, Chicago Heights, Ill., assignor to Brunswick Seal Co., Chicago, Ill., a corporation of Illinois
Application June 2, 1954, Serial No. 433,900
2 Claims. (Cl. 103—111)

1. In a water pump seal arrangement, in combination, a pump impeller, a shaft arranged to rotate in a predetermined direction, said impeller having a hub keyed to rotate with the shaft, a sleeve of elastomeric material encircling said shaft spaced therefrom, a cover plate having a conoidal wall sealingly secured at its larger end to one end of the sleeve and at its smaller end telescoping over the hub with a clear running fit, a plurality of more than three peripheral perforations in said conoidal wall spaced circumferentially thereabout, each perforation being formed by a struck-out portion of said wall bent to provide an upstanding baffle for said perforation, said baffles being jointly disposed in a common radial plane intersecting said conoidal wall and each said baffle being disposed with its two greater dimensions lying substantially in an axial plane relative to said shaft and being on the far side of its perforation looking in the direction of rotation of the shaft, whereby, upon actuation of said impeller by said shaft, water activated thereby is circulated annularly in said direction about said conoidal wall and is directed by said baffles through said perforations into the space within said sleeve, and means at the other end of the sleeve providing a rotary running sealing engagement between said sleeve and said shaft.

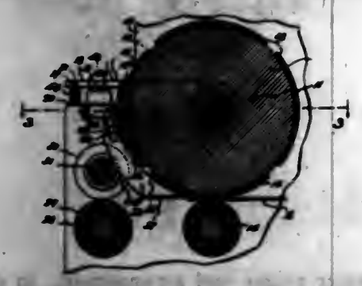
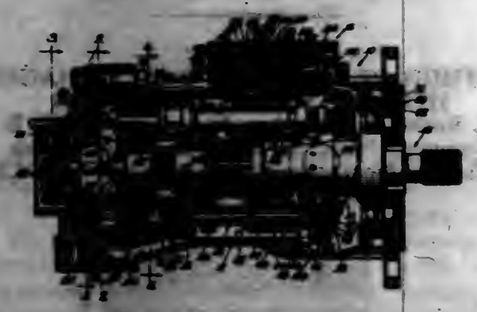
2,769,391
METHOD OF MANUFACTURING IMAGED HECTOGRAPH SPIRIT MASTER
Allan I. Roshkind, Glenview, Ill., assignor to A. B. Dick Company, Niles, Ill., a corporation of Illinois
Application November 14, 1951, Serial No. 256,250
2 Claims. (Cl. 101—149.4)



1. In the method of producing an imaged hectograph spirit master directly from an original having the reproducible portion in the form of a black letter outline containing infra red absorbing-heat generating material, the steps of positioning the original, the hectograph master sheet and a transfer sheet having a non-infra-red absorbing composition which is solid at room temperature and which is reducible to flowable condition at elevated temperatures and containing a hectograph dye in surface contact with each other with the transfer sheet adjacent the hectograph master at about ambient temperature without preheating, directing a sufficient quantity of radiations rich in infra-red onto the original substantially instantaneously to generate a temperature rise above 150° F. in the black letter outlines which reduces the composition in corresponding areas of the transfer sheet to flow-

able condition whereby the flowable material transfers to the hectograph master to provide an image thereon corresponding to the original.

---



2,769,392
**PRINTING CYLINDER STRIPPING MEANS WITH STOP PRESS CONTROL**
William B. Leavens, Jr., West Orange, N. J.
Application February 15, 1955, Serial No. 488,271
10 Claims. (Cl. 101—232)

1. In a printing press the combination with a printing cylinder thereof of stripping means adjacent the discharge side of the printing cylinder including peeler blade means to engage the leading end of printed material issuing from said printing cylinder, whereby to inhibit adherence of said material to the latter and thus normally compelling said material to advance along the plane of the paper line of the press, and means to pivotally support said stripping means for movement in a path substantially concentric to the axis of said printing cylinder, whereby the same will yield to upthrusting pressure of printed material abnormally discharged from the printing cylinder with jamming effect, and whereby said stripping means can be manually displaced to give access to jamming material for removal thereof.

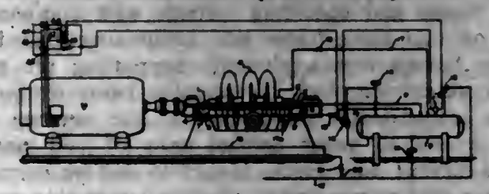
2,769,393
**HYDRAULIC PUMP AND CONTROL**
Joseph S. Carrillo and Melvin M. Hann, Rockford, Ill., assignors to Sundstrand Machine Tool Co., a corporation of Illinois
Application March 23, 1951, Serial No. 217,258
11 Claims. (Cl. 103—5)

1. In a hydraulic pump or motor having a cylinder block, a plurality of parallel cylinders annularly arranged in the block, a piston reciprocable in each cylinder, a swash plate positioned to contact the ends of the pistons for moving the pistons in the cylinders and angularly movable to vary the stroke of the pistons, and a drive shaft operatively connected to rotate the block relative to the swash plate, spring return means for the pistons comprising a semi-spherical recess formed in the end of the block adjacent the swash plate, a spring supporting member having an annular flange rockably received in the recess and a second annular flange extending substantially at right angles to the first flange, a plurality of semi-spherical openings in the second flange each surrounding a different one of the pistons, a spring seat having a semi-spherical base positioned in each opening, and a plurality of compression springs each encircling a different one of the pistons and having one end seated in a spring seat and having its other end secured to the piston for urging the piston in the direction of the swash plate.

---



2,769,394
**POWER UNIT**
John A. Lauck, Shaker Heights, Ohio, assignor to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois
Application October 21, 1949, Serial No. 122,787
3 Claims. (Cl. 103—11)

1. In a fluid pressure system subject to variable pressure and temperature conditions, a pair of parallel connected pumps, one of which has a fixed displacement and the second of which is provided with an axially movable pressure loadable bushing, means to pressure load said bushing, said pumps having interconnected outlets, means to prevent the flow of fluid from said fixed displacement pump to said second pump, means connected in said system beyond said flow preventing means and to said second pump operable to cause an unloading of said bushing at and above a predetermined system pressure, and means connected in said system beyond said flow preventing means responsive to temperature and/or pressure providing a pressure drop in said system and thereby affecting said system connected means, said last-two-named means controlling the output of said second pump, said fixed displacement pump normally supplying the pressure requirements of said system and said second pump assisting said fixed displacement pump at requirements above normal.

---

2,769,395
**LEAK DETECTOR AND PUMP CONTROL SYSTEM**
Frank W. Olson, Jr., Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware
Application April 2, 1954, Serial No. 420,725
2 Claims. (Cl. 103—12)

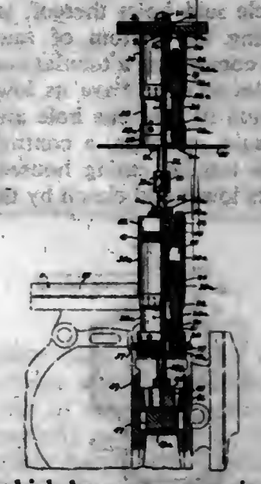
1. In combination with a shut-down device for a fluid moving means moving a fluid, and from which leakage of said fluid can occur, a vessel to collect fluid leaking from said moving means; means for conveying leaked fluid from said fluid moving means to said vessel; said vessel having a fluid discharge means adapted to discharge fluid therefrom at a predetermined rate to remove from said vessel fluid resulting from normal leakage; said vessel having also means responsive to the accumulation of said fluid operatively connected to said shut-down device so as to operate said device whenever the fluid in said vessel exceeds a predetermined quantity; said means responsive to the accumulation of said fluid being a pressure-actuated control upon a power source supplying power to said fluid moving means; said vessel also having a vapor vent allowing flow of atmosphere outside of said vessel into said vessel but being so constructed and arranged as to prevent outward flow of vapors, from within said vessel, above a predetermined vapor flow rate therethrough.

---

2,769,396
**PRESSURE LOADED GEAR PUMP**
Francis E. Norlin, Chesterland, Ohio, assignor to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois
Application September 28, 1953, Serial No. 382,682
17 Claims. (Cl. 103—126)

1. A pressure loaded type intermeshing gear pump including a housing having a pumping chamber formed therein and an inlet port formed on one side of the housing and an outlet port formed on the opposite side of the housing, said ports communicating with said pumping chamber, intermeshing pumping gears disposed in said chamber, bushings operatively associated with each of said pumping gears, at least one of said bushings being axially movable in response to application of discharge pressure to the rear surface thereof to engage the operatively associated gear side face in sealing relation, and resilient means operatively associated with said axially movable bushing for urging said bushing in a direction substantially normal to the axis of rotation of said pumping gears and towards the inlet side of said pump, said resilient means comprising a ring segment.

---

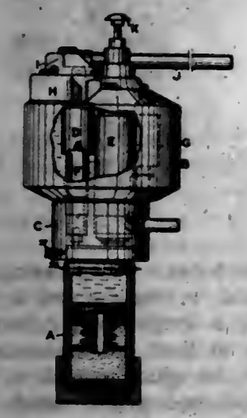


2,769,397
**COLLAPSIBLE CHAMBER FLUID HANDLING DEVICE**
William R. Bolger, Cleveland, Ohio
Application December 22, 1950, Serial No. 202,377
4 Claims. (Cl. 103—148)

2. A device for the purposes described comprising a housing, an elongated resilient normally open sleeve in the housing and spaced from opposite walls thereof, connecting means spaced apart endwise of the sleeve and supporting and holding the sleeve under tension endwise, a plurality of pairs of inflatable tubes arranged in the housing, the tubes of each pair being on opposite sides of the sleeve between the sleeve and the adjacent ones of said side walls, respectively, each pair being disposed at a different position lengthwise of the sleeve than the other pairs, and means for inflating and deflating the tubes of each pair in a predetermined timed relation to those of the other pairs.

---

2,769,398
**PUMP DEVICE**
William E. Buckley, Huntington, N. Y., assignor to The Cornell Machine Company, New York, N. Y., a corporation of Ohio
Original application November 16, 1950, Serial No. 195,965. Divided and this application February 15, 1952, Serial No. 271,671
2 Claims. (Cl. 103—160)



1. A pump which has a pump casing in which a rotor is turnably located to rotate about a longitudinal axis, said rotor having a longitudinal cylindrical face which is interrupted by at least one transverse port and also by a longitudinal slot which extends to the front of said rotor, a channel-shaped piston which has longitudinal arms and which is open at its front edge and which is transversely slidable in said slot of said rotor, a shuttle which fits longitudinally slidably between said arms, said casing having an internal longitudinal cylindrical face in which said rotor fits save where said rotor is thus interrupted, said shuttle having a median longitudinal recess in its front face, a front plate fixed to said casing, a lever located in front of said front plate and pivoted to and turnable relative to said front plate, a rear shuttle pin connected to said lever and extending rearwardly through an oversized hole of said front plate into said recess, said front plate being closed save where the pivot of said lever is located and save for said oversized hole, a front longitudinal pin connected to said lever and extending forwardly from said lever, an additional cover plate for said casing located in front of said lever, said additional plate being fixed to said casing, a guide fixed to said additional plate, a plunger located in said guide, said plunger having a cross-pin which has a longitudinal opening into which said front longitudinal pin extends, the turning of said lever relative to said casing determining the offset of said shuttle pin from the axis of rotation of said rotor, spring means which bias said lever to turn to a position in which said offset is a maximum, and adjusting means operative to adjust said plunger in said guide and thereby to adjust said lever against the force of said spring to a selected offset, said guide being sealed from said additional cover plate, said additional cover plate being free from ports, the offset of said shuttle pin from the axis of rotation of said rotor being regulated solely by the position of said plunger in said guide, and actuating means for moving said plunger in said guide in a selected direction, said actuating means being solely manually operated.

---

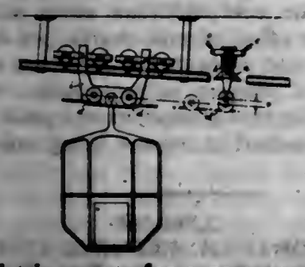
2,769,399
**HYDRAULIC FEEDING UNIT**
Jean Louis Gratzmuller, Paris, France
Application October 4, 1951, Serial No. 249,748
Claims priority, application France October 9, 1950
2 Claims. (Cl. 103—223)

1. A hydraulic energy storage unit comprising, in combination with a plurality of cooperating elements

adapted to store liquid pressure and to deliver said stored liquid pressure, an assembling block for said elements having a lower end portion recessed to receive one of said elements and an upper horizontal surface provided with at least two vertical holes each adapted to receive one of two others of said elements, said elements including a liquid storage reservoir having a cylindrical side wall the lower end portion of which is joined to said upper surface so as to encircle said holes thereof, said upper surface thus constituting the bottom of said reservoir, a reciprocating pump comprising a tubular casing housed in one of said two holes so as to have its lower end closed by the bottom portion of said one hole and having inlet means opening in said reservoir, a control valve mechanism comprising a tubular casing housed in the other hole so as to have its lower end closed by the bottom por-

tion of said other hole, and a hydro-pneumatic accumulator comprising a pressure vessel having a movable partition therein dividing the vessel into a closed gas pressure chamber and an open ended liquid pressure chamber inserted in said recessed lower end portion of the assembling block so as to be tightly closed thereby, said assembling block further being provided with passageways interconnecting said lower end portion with each of said holes to conduct the liquid drawn by said pump from said reservoir to the liquid pressure chamber of said accumulator and the liquid stored by the latter at a predetermined pressure to said control valve mechanism, respectively, and an outlet duct leading from said other hole to the outside of said block, said valve mechanism being adapted to control the delivery of stored pressure liquid from said accumulator to said outlet duct.

---



2,769,400

**ELECTRICAL TRIP MEANS FOR STOPPING PASSENGER CABLE RAILWAYS**

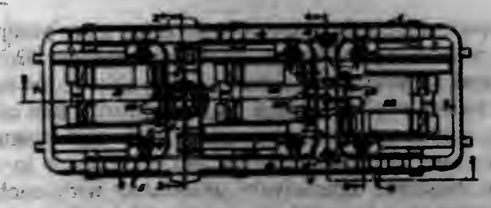
Georg Wallmannsberger, Munich, Germany

Original application November 28, 1947, Serial No. 788,758, now Patent No. 2,688,161, dated August 26, 1952. Divided and this application August 25, 1952, Serial No. 306,267

6 Claims. (Cl. 104—202)

1. Electrical trip means for a passenger cable railway including at least two stations comprising a cable car, a carrying cable for supporting the same between the stations, an endless traction cable for moving the car between the stations, drive means for driving the traction cable including an electric motor, said car including a running gear frame, rollers on the frame engaging the carrying cable, clamping means carried by the car for clamping the traction cable including at least one pair of jaws including a fixed jaw and a movable jaw extending laterally of the frame and operable to grip the traction cable from above and below the same, means for applying clamping force to the jaws, an arm extending from the movable jaw in a direction transverse of the line of movement of the car, a roller on said arm, a coupling-in point at the station, a lever means in the line of movement of the roller and located beyond the coupling-in point, said lever being engageable by the roller when the traction cable has not been clamped by the jaws at the coupling-in point and electrical switch means including said lever means in operative circuit relationship with said drive means for stopping the railway when the traction cable has not been clamped and the roller has engaged and moved said lever means.

---



2,769,401

**RAILWAY TRUCK**

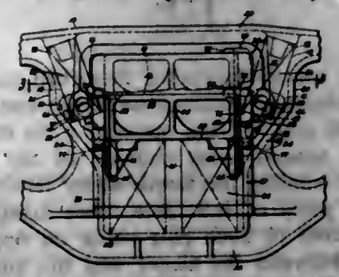
Adelbert C. Wintemberg, Drexel Hill, Pa., assignor to General Steel Castings Corporation, Granite City, Ill., a corporation of Delaware

Application January 24, 1952, Serial No. 268,834

6 Claims. (Cl. 105—59)

1. In a railway truck, three wheel and axle assemblies, a motor on each assembly, a truck frame mounted on said assemblies and having three points of support for a vehicle body, one of said supports being on the longitudinal center line of the truck and forming a center bearing support about which the truck may swivel and the other two supports being spaced apart transversely of the truck and spaced from said center plate longitudinally of the truck and over which the vehicle body may slide as it swivels about said center bearing, the truck frame forming air conduits leading to the motors, there being an axial opening through said center bearing to admit air to one of said conduits, and there being an opening through the top of the frame between the other two supports to admit air to the other of said conduits.

---



2,769,402

**CAR TRUCK**

James A. Shafer, East Cleveland, Ohio, assignor to National Malleable and Steel Castings Company, Cleveland, Ohio, a corporation of Ohio

Application April 16, 1953, Serial No. 349,198

6 Claims. (Cl. 105—197)

5. In a car truck, a side frame having a bolster-receiving opening, a bolster extending into said opening and resiliently supported on said frame, said bolster having abutment means for preventing separation of said

bolster and frame except when said bolster is in a predetermined tilted position about its longitudinal center line, said means comprising a lug extending above the top surface of said bolster.

---

2,769,403

**VALVE ASSEMBLY FOR HOPPER-TYPE VEHICLES**

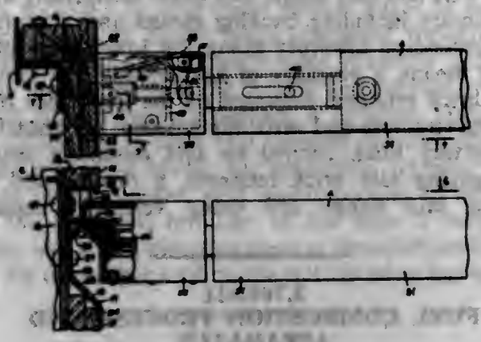
Joe L. Cox, Pomona, Calif., assignor to Brogdex Company, Pomona, Calif., a corporation of California

Application November 3, 1952, Serial No. 318,404

11 Claims. (Cl. 105—288)

1. In a valve assembly for discharge of flowable bulk material from a hopper-type vehicle, the combination of: a hollow valve throat member having a discharge opening; a pair of valve closure elements pivotally carried in the throat member for closing said opening and means for supporting said valve elements in closed position and operable to selectively move one valve element to open position while the other element remains closed, said supporting means including a plurality of transversely disposed spaced rollers bearing against bottom surfaces on said valve elements and movable about an axis centrally disposed between the valve elements, and said bottom surfaces including curved edge faces extending laterally inwardly from each valve closure element and cooperable with said rollers.

---



2,769,404

**ANCHORING MEANS FOR VEHICLE CARGO**

William F. Dietrichson, Garden City, N. Y., assignor to ACF Industries, Incorporated, a corporation of New Jersey

Application March 6, 1952, Serial No. 275,161

1 Claim. (Cl. 105—369)

Cargo bracing means comprising a body, hollow heads carried by and projecting from the ends of the body, anchor means on the under face of said heads, slidable locking members carried by said heads below said anchor means, spring means in said heads normally urging said locking means in a direction away from the ends of the heads, and bell-cranks pivoted in said heads, said bell-cranks operatively engaging said locking members and being accessible from the exterior of the heads for operation to retract said locking members.

---

2,769,405

**DOOR OR FRAMING POST FOR FREIGHT CARS INCLUDING LADING STRAP ANCHOR**

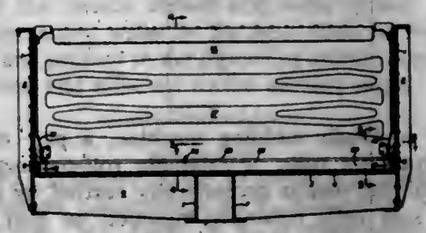
Karl F. Nystrom, Chicago, Ill., assignor to International Steel Company, Evansville, Ind., a corporation of Indiana

Application January 7, 1952, Serial No. 265,245

2 Claims. (Cl. 105—369)

1. A composite door post and a lading strap anchor member comprising a vertically extending metallic member having a pair of substantially parallel side walls and an end wall angularly mitered at one corner thereof and a lading strap anchor member attached to the mitered corner of said metallic member and having bodily displaced portions disposed at spaced intervals along the length of said anchor member, said displaced portions being directed away from the surface of the corner of said metallic member for providing spaced openings for the passage of a lading strap between said anchor member and the mitered corner of said metallic member, said lading strap anchor member being of substantially circular section with the bodily displaced portions transversely enlarged at said spaced openings and formed on curves with which planes contiguous with the end and the side wall immediately adjacent the mitered corner of said metallic member are substantially tangent.

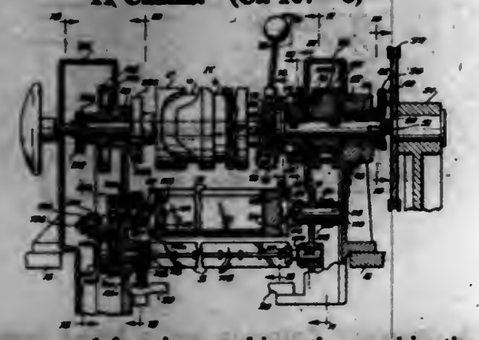
---



2,769,406

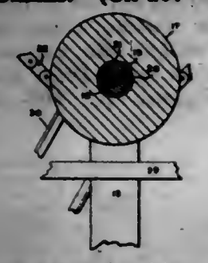
**COUNTERBALANCED END DOORS FOR DROP END GONDOLA CARS**

Ernest G. Goodwin, Toledo, Ohio, assignor to Unitcast Corporation, Toledo, Ohio, a corporation of Ohio



Application September 25, 1951, Serial No. 248,227

11 Claims. (Cl. 105—406)



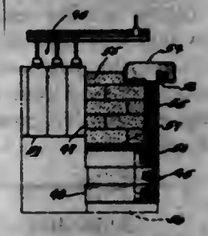
6. In a drop end door for a gondola car, said door being formed with a slot, door hinge members carried by said door, and cooperating car hinge members to be secured in position to the side walls of the car after the door has been dropped down in final mounting position in the car, the combination of a torsion bar disposed in said door and extending outwardly beyond a portion thereof, a spool disposed for partial rotation in said door and having an angular recess to receive the inner portion of said torsion rod and having a lug rigid with it and extending in said slot and movable therein in an arc and adapted to be secured in a fixed position therein incident to the final adjustment of the torque load on said torque bar.

2,769,407
**PRETZEL MACHINE**
Howard G. Allen, Niagara Falls, and Owen M. Hudson, Kenmore, N. Y., assignors to American Machine & Foundry Company, a corporation of New Jersey
Original application December 29, 1945, Serial No. 638,230, now Patent No. 2,629,340, dated February 24, 1953. Divided and this application February 16, 1953, Serial No. 337,962
11 Claims. (Cl. 107—8)

1. In a pretzel forming machine, the combination with a device for delivering an elongated dough stick to a predetermined position, means for transferring elongated dough sticks transversely to said device, a driven shaft connected to and driving said means and device, a driving shaft, a driving overload, throw-out clutch connection between said driving and driven shafts constructed and arranged to throw out when an overload is placed on the driven shaft, and thereby interrupt the operation of said means and device, and a deflector member movable to a deflecting position between said means and device and operatively connected to said driving clutch connection to be moved to said deflecting position when said clutch connection yields upon an overload on said driven shaft, said deflector member being operable to divert away from said device dough sticks delivered from said means.

2,769,408
**DOUGH MOLDING APPARATUS**
Herbert C. Rhodes, Portland, Oreg.
Application October 9, 1953, Serial No. 385,042
2 Claims. (Cl. 107—12)

1. In a dough molding machine, a pair of rotating dough molding rolls, a rotatable roll-supporting shaft, roll mounting means eccentrically carried by said shaft, one of said rolls rotatably mounted on said mounting means, means for rotating said rolls towards each other at the same peripheral speed, and means for rapidly rotating said shaft and said eccentrically-carried roll mounting means independently of the rotation of said rolls, whereby the spacing between said rolls can be rapidly varied and thereby cause the dough to be subjected to rapid variations in spreading pressure during the passage of the dough between the rolls.

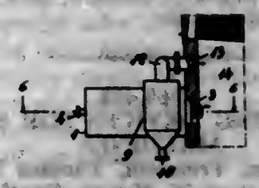


2,769,409
**CONSTRUCTION OF DOME-SHAPED ROOFS**
Walter Rutten, Plainfield, Ill.
Application June 19, 1952, Serial No. 294,380
6 Claims. (Cl. 108—32)

1. The combination with a dome-shaped silo roof of the type made up of a plurality of arcuate sector shaped roof segments having interlocking flanges, an L-shaped ring member attached to the upper end of each segment and a hoop surrounding a silo to which said dome-shaped roof is anchored about its top, of a sector-shaped door for said roof, said door pivoted at its upper end about a bolt on said ring member, a track connected to

said silo hoop adjacent the lower end of said door, said track spaced away from and generally concentric to said hoop and inclining upwardly from said hoop and means associated with said door for guiding the lower end thereof on said track, said means including a pair of brackets attached to the lower end of said door, each bracket having a loop portion encircling said track.

2,769,410
**FURNACE CONSTRUCTION, INCLUDING PORTABLE WALL PANEL**
Raymond E. Over, Mokena, Ill., assignor to M. H. Detrick Company, Chicago, Ill., a corporation of Delaware
Application December 13, 1954, Serial No. 474,809
2 Claims. (Cl. 110—1)



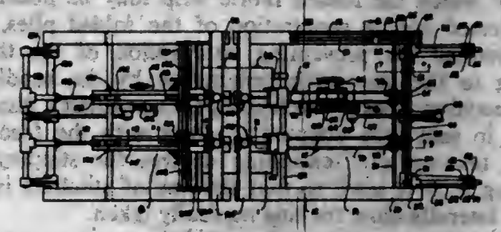
1. In a furnace having an arch and a wall adjacent one marginal edge thereof, said arch terminating in general alignment with the inner face of said wall and said wall terminating below the plane of the inner face of said arch, the combination therewith of a portable wall panel disposed in part in the wall space between the top of said wall and said plane, said panel comprising mounting structure including backing means and a horizontal flange extending inwardly along the lower edge of said backing means, a plurality of horizontally and vertically spaced brick retainers mounted on the inner face of said mounting structure and vertically adjacent horizontal rows of refractory brick carried by said mounting structure and engaging said brick retainers, a row of said brick engaging said flange and being vertically supported thereby.

2,769,411
**FUEL COMBUSTION PROCESS AND APPARATUS**
Torsten Magnus Georg Simmons, Norrkoping, Sweden, assignor, by mesne assignments, to Rosenblad Corporation, New York, N. Y., a corporation of New York
Application November 6, 1951, Serial No. 255,097
2 Claims. (Cl. 110—28)

1. In a combustion process for using fuel which yields solid components of combustion, the steps of passing the fuel and air into one end of a whirl type combustion chamber having an axial main exhaust at its other end, causing the fuel to ignite and the ignited fuel, air and combustion products to flow in a helical path toward the main exhaust, thereby causing the peripheral layer of

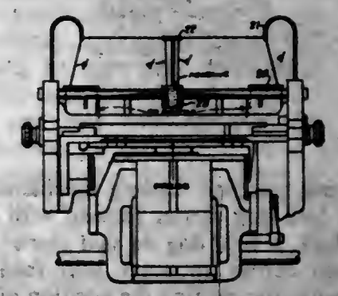
gas nearest the interior surface of the chamber to become enriched, under the influence of centrifugal force, with solid components, tangentially withdrawing the enriched gases from the periphery of the helical flow path in the vicinity of and in advance of the main exhaust, separating the solid components from the withdrawn en-

riched gases externally of the combustion chamber for removal from the combustion process, and passing the remaining combustion gases in the combustion chamber through the main exhaust for heating purposes, and passing the gases from which the solids components have been separated into the same heat consuming contrivance.



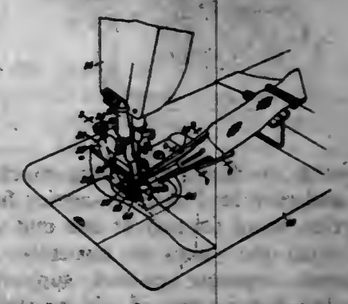
2,769,412
**PLANTER SHOE**
Otto E. Holle, Fort Wayne, Ind.
Application January 16, 1953, Serial No. 331,595
7 Claims. (Cl. 111—73)

1. A planter shoe comprising an elongated structure having front and rear ends and vertically parallel longitudinally extending sides, a forwardly projecting runner plate secured between said sides and extending rearwardly a distance short of said rear end, said sides converging forwardly inwardly and secured to opposite sides respectively of said runner plate whereby the sides will have a tapered configuration in transverse longitudinal section, said sides having upper and lower bottom edges, the lower bottom edges being disposed forwardly of the upper bottom edges, the forward portion of the shoe which includes said lower bottom edges providing a furrow-forming portion having vertically arranged outer surfaces offset inwardly from the respective sides, two depending deflecting blades provided on said upper bottom edges of said sides respectively, said blades being staggered forwardly and rearwardly and angling rearwardly inwardly and downwardly into the path of the furrow wall formed in the soil by said furrow-forming portion, a fertilizer feeding passage between said sides and opening downwardly ahead of said deflecting blades for depositing fertilizer on the bottom of the furrow, said blades serving to throw soil over the deposited fertilizer as the shoe is moved forwardly, and a seed directing passage provided between said sides for depositing seed on the soil covering the fertilizer.



2,769,413
**CORD INSERTION APPARATUS**
Eugene Thomas Bodard, Nelson, British Columbia, Canada
Application May 4, 1953, Serial No. 352,936
19 Claims. (Cl. 112—2)

1. In apparatus for inserting cord through a cardboard blank from edge to edge thereof; a cord inserting mechanism comprising supporting means for holding a cardboard blank in a given plane, a tube slidably supported to one side of the supporting means in said plane, said tube being long enough to extend through a blank, means connected to one end of the tube for moving it forward and back past the supporting means through the blank plane, a needle extending through the tube and projecting from the free end thereof, hook means on the end of the needle protruding from the tube, said needle moving with



the tube, means for moving the hook relative to the adjacent end of the tube at opposite ends of each stroke thereof, and cutters on the free end of the tube projecting outwardly therefrom in the blank plane.

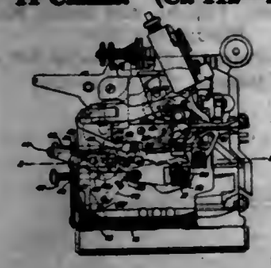
2,769,414
**BOOKBINDING METHOD AND MEANS**
Hugo Kalmbacher, Toledo, and Heinz Kalmbacher, Maumee, Ohio
Application October 5, 1955, Serial No. 538,655
3 Claims. (Cl. 112—21)

2. In a bookbinding machine in which successive book sections are bound together and in which a plurality of needle thread loops are forced in a row through each book section when placed in position in the machine and each of such thread loops is provided with a side loop adjacent to the outer end of its needle, and a shuttle thread loop is fed transversely through said side loops and pressed therewith against the book section being bound, the improvement comprising the provision of means for saturating the shuttle thread with an adhesive before engagement by the shuttle and squeezing some, at least, of the adhesive from the shuttle thread over the adjacent surface of the needle thread and book section by said pressing operation, whereby the next book section when placed on and pressed to the preceding section is cemented thereto along and adjacent to the binding edge.

2,769,415
**ATTACHMENT FOR BLINDSTITCHING**
Victor J. Sigoda, Great Neck, N. Y., assignor to Man-Sew Corporation, New York, N. Y., a corporation of New York
Application August 27, 1952, Serial No. 306,631
13 Claims. (Cl. 112—140)

1. In an attachment, for the production of blindstitching in conjunction with the stitchforming, thread take-

up and tensioning and feed mechanisms of a sewing machine, said attachment being provided with means for folding and guiding a fabric strip to be blindstitched, and adjacent thereto, a presser shoe having a nose over the edge of which the folded fabric strip may be positioned for selected needle penetration of the folded plies, that improvement for preventing interception of the thread leading to the last stitch penetration by the needle on its descending stroke which comprises angularly disposed means in said shoe adapted to coact with the feed and thread take-up and tensioning devices for slipping the stitching as it is sewn so that the line of stitching is displaced laterally from the line normally taken.



---

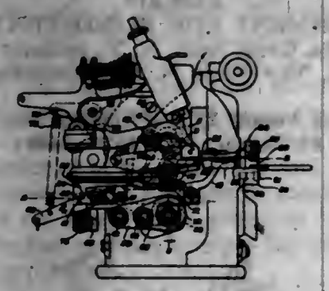
2,769,416

## FEED CONTROL FOR SHIRRING MECHANISM

Bernard N. Pierce, West Hartford, Conn., assignor to The Merrow Machine Company, Hartford, Conn., a corporation of Connecticut

Application November 19, 1953, Serial No. 393,203
11 Claims. (Cl. 112—209)

1. In a sewing machine feeding mechanism having a guide block, a feed dog carrier formed with a yoke slidable on said block, a feed dog on said carrier, and means for moving said carrier to move said feed dog in an orbital path, means for shifting the position of said orbital path relative to said frame comprising a rock shaft journaled in the frame of the machine, a collar on the end of said rock shaft, an eccentric stub shaft extending axially from said collar beyond the end of said rock shaft and forming a pivotal support for said guide block, and an actuating lever extending radially from said collar for turning said rock shaft to shift said stub shaft and thereby change the position of the orbital path in which said feed dog is moved.



---

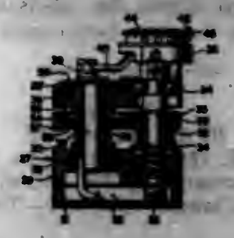
2,769,417

## FEED CONTROL FOR SHIRRING MECHANISM

Edward R. Lamoureux, Bloomfield, and Bernard N. Pierce, West Hartford, Conn., assignors to The Merrow Machine Company, Hartford, Conn., a corporation of Connecticut

Application July 29, 1952, Serial No. 301,426
15 Claims. (Cl. 112—209)

1. In a sewing machine, a feeding mechanism comprising front and rear feed dogs, a carrier for each feed dog, each carrier being formed at one end with a yoke, blocks with which the yokes of respective carriers are slidably engaged, separate pivotal supports for said blocks, means for shifting one of said pivotal supports to change the position of its axis with respect to the axis of the other of said pivotal supports, means for independently moving said carriers to impart four-motion feeding movements to said feed dogs, the respective positions of the paths of movement of said feed dogs being determined by the relative positions of said axes, and adjustable stop means limiting the shifting movement of said one pivotal support to determine the relative positions of said orbital paths.



---

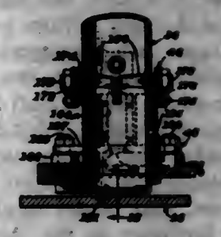
2,769,418

## LUBRICATING DEVICES FOR SEWING MACHINES

Edwin W. Johnson, Trumbull, Thomas M. Donaldson, Fairfield, and Robert W. Hewey, Stratford, Conn., assignors to The Singer Manufacturing Company, Elizabeth, N. J., a corporation of New Jersey

Application March 8, 1954, Serial No. 414,666
4 Claims. (Cl. 112—256)

1. In a sewing machine, a loop-taker supporting saddle, an actuating shaft journaled for rotation in said machine, a driven shaft journaled for rotation in said saddle, a train of gears connecting said actuating shaft to said driven shaft, at least one of said gears being rotatable about a substantially vertical axis and being formed of a porous material capable of conducting lubricant therethrough, an upwardly open lubricant containing recess formed in said porous gear, and means in said saddle for delivering lubricant into said recess.



---

2,769,419

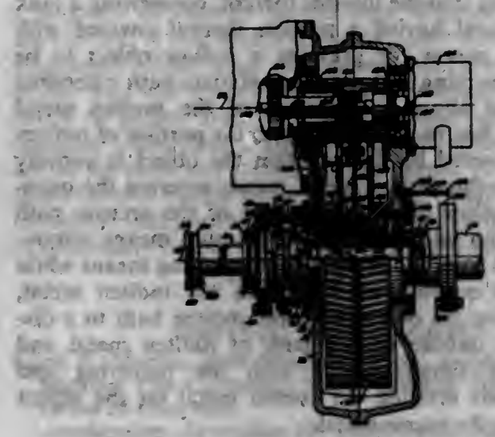
## GLOSURE CAP ELEMENT FEEDING APPARATUS

Elbe A. Wilchens, Baltimore, Md., assignor to Crown Cork & Seal Company, Inc., Baltimore, Md., a corporation of New York

Application January 6, 1949, Serial No. 69,516
12 Claims. (Cl. 113—114)

1. In a cap assembling apparatus, a base, a vertical guideway fixed to said base, a dial rotatable with respect to said base and including a circumferential series of pockets, a cap element supply tube positioned above said dial and supported on said guideway for vertical movement, a circumferential series of strikers rotatable with said dial, a cam supported by said base for rotation about a horizontal axis and including a rise and a dwell, a cam follower fixed to said supply tube and engaging said cam, a cam actuator rotatable with respect to said cam and including two circumferential series of trips, the two series of trips being spaced axially of said actuator and the trips of the respective series being circumferentially staggered, said cam actuator being movable axially of said cam so that said series of trips will be selectively positionable in the path of movement of said strikers, and means to control the position of said cam actuator with respect to said strikers.

8. In combination, a base, a cap element supply tube carried by said base, a cap element conveying means supported and movable on said base below said tube to receive cap elements therefrom, a tapping element pivoted on said base on an axis parallel with the axis of said tube, said tapping element including a pair of striker arms extending on opposite sides of said tube, and means operatively engaging said tapping element and movable with said cap conveying means to oscillate said tapping element and move said striker arms alternately toward and away from said tube to strike the latter and thereby agitate the stack of cap elements in said tube.



---

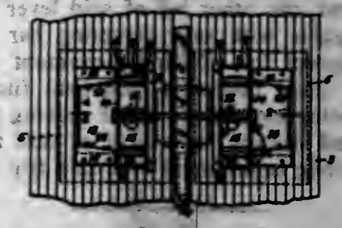
2,769,420

## MARINE PROPULSION MECHANISM

Winthrop S. Horton, Farmington, and Carroll J. Lucia, Birmingham, Mich., assignors to Studebaker-Packard Corporation, a corporation of Michigan

Application August 31, 1953, Serial No. 377,418
17 Claims. (Cl. 115—34)

2. For use with a torque-producing source of prime power, a transmission aligned with and drivable by the prime power source and having a case provided with a transversely offset gear reduction portion, a centrally-open pinion-driven gear mounted in said offset case portion for rotation therein, a first shaft and a second propeller-connected shaft substantially coaxial therewith, said shafts extending in opposite directions from said case portion and disposed with their inner ends in spaced apart registry with respect to the central opening in the gear, a hollow box detachably carried by the inner end of said first shaft, a bed for supporting the source of prime power having a depending portion fixedly supporting the first shaft, stub shaft structure comprising a pair of detachably telescopically engaged shaft members extending into the central opening of said gear from the opposite sides thereof, torque-transmitting means supporting said stub shaft structure concentrically within such opening comprising a hub assembly splined thereto and a flexible coupling element having a portion fastened to the gear and another portion fastened to the hub assembly, the distal end of one shaft member of said pair being drivingly connected to the propeller-connected second shaft and the distal end of the other shaft member being received in said bearing box, and means in said bearing box restraining said other shaft member from appreciable movement in an axial direction relative to the first shaft so as to oppose propeller thrust reaction in the second shaft and permitting limited transverse movement of the said other shaft member within said bearing box so as to accommodate flexure-reaction-induced tilting movement of the stub shaft structure with respect to the central opening in the gear as a center.



---

2,769,421

## INBOARD DRIVE FOR WATER CRAFT

John Grieve, Paris, Ontario, Canada, assignor of one-half to Charles Harper, Brantford, Ontario, Canada

Application May 10, 1954, Serial No. 428,751
2 Claims. (Cl. 115—53)

1. An inboard drive for water craft comprising a base-plate provided with a central opening therethrough and adapted to be fastened to the upper side of the bottom of a boat over a like opening therethrough; a wall-provided housing forming part of said base-plate and extending thereabove and having a bottom opening in alignment with said central opening; an inner end wall of said housing; a propeller wheel journalled in and adjacent said inner end wall and operating through said base-plate, the open bottom of said housing and said boat-bottom; aligned parts at opposite sides of said base-plate, and the adjoining side walls of the housing, offset upwardly wholly in alignment with said propeller wheel thus forming an outwardly-downwardly sloping surface having at the outer side thereof a wall formed from said base-plate and said housing, the offset structure thus forming portion of the mouth of a channel; another channel comprising a bottom plate; a vertical wall at each side of said bottom of greater length than said bottom plate and extending above said bottom plate into contact with said base-plate; means whereby said wall-provided channel is attached to said base-plate over said propeller wheel and above said sloping surface to provide therewith a mouth at each end of said bottom plate through which a stream of water is forced by said propeller wheel and a channel tapered longitudinally and provided with an open under side, located in said housing laterally of said propeller wheel with its wider end at the adjacent side of said wheel to positively direct water to said wheel for the diameter thereof.

2,769,422

## SPRING MOTOR-OPERATED FIRE ALARM

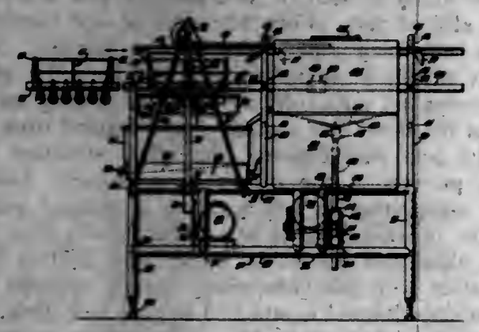
Raymond L. Jenks, Chester, Calif.

Application November 12, 1954, Serial No. 468,353
4 Claims. (Cl. 116—101)

1. In a fire alarm system, a spring wound motor, a dome-shaped bell mounted in cooperating relation with respect to said motor, a trip release operatively connected to said motor for movement from a cocked position to prevent operation of said motor to an uncocked position to permit operation of said motor and having a portion extending into said bell, a reciprocating actuating bar having one end contacting said trip release to hold it in its cocked position, spring means operatively connected to said bar for urging said bar to its contacting position to

hold said trip release in its cocked position, an L-shaped lever positioned adjacent to said bar intermediate its ends and connected at the juncture point of its legs for rocking movement about a vertical axis, and a spring biased plunger normally held under tension by a fixed connection of a heat fusible material and engaging one leg of said L-shaped lever, the other leg of said lever being operatively engageable with said actuating bar adjacent the other end thereof for effecting movement of the latter, said plunger upon fusion of said heat fusible material connection being movable to effect rocking movement of said lever and shifting movement of said actuating bar out of contacting engagement with said trip release.

---



2,769,423

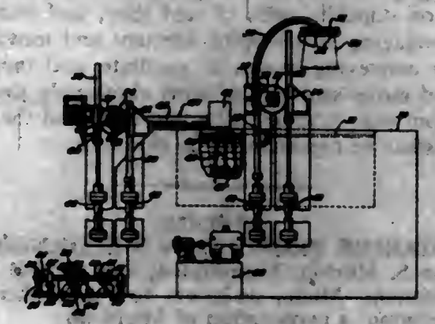
## CONFECTION COATING APPARATUS

Fred A. Landgraber, Sr., Fort Newark, N. J., assignor to Drumstick, Inc., Fort Worth, Tex., a corporation of Texas

Original application November 6, 1951, Serial No. 255,115, now Patent No. 2,670,897, dated March 2, 1954. Divided and this application December 23, 1953, Serial No. 399,898

10 Claims. (Cl. 118—2)

4. Confection coating apparatus for applying successive coatings of edible material to a frozen confection of the type consisting of an ice cream cone filled with hard frozen mix which protrudes beyond the cone, the protruding part being enrobed with a coating having edible granules dispersed thereupon and adhering thereto, said apparatus including a frame, and in juxtaposition upon said frame, means for enrobing the protruding fillings of such cones and means for applying edible granules to said enrobed fillings, a track extending through said frame over said enrobing means and granule applying means, a basket slidable on said track, said basket being of the cone type which suspends the filled cones in inverted position in rows from its bottom, means for moving a basket of cones from a position above said enrobing means to a position over said granule applying means, stopping it in each position to effect the enrobing and granule application, said granule applying means including frame members beneath said track defining a surround in a horizontal plane bounding an area at least as large as said basket, a flexible diaphragm overlying said surround having its peripheral edge secured to said surround, the upper face of said diaphragm being a receptor for granules, a stem secured to the under side of said diaphragm for flexing it, guides in which said stem is vertically reciprocable, a spring surrounding said stem and upwardly bearing against an abutment on said stem to resiliently bias said diaphragm upwardly, a motor, a cam rotated by said motor, said cam having a long throw followed by an abrupt descent, an arm pivoted to said frame at one end and at the other connected to said stem, said arm having means engaged by said cam for oscillating said arm to alternately compress and release said spring for dashing granules against the enrobed surface of said cones through the release pressure of said spring.



2,769,424

## APPARATUS FOR COATING METAL ARTICLES

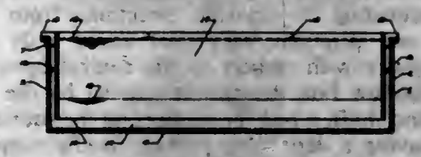
Leslie O. Stanley, St. Clairsville, Ohio, assignor to Wheeling Steel Corporation, Wheeling, W. Va., a corporation of Delaware

Application January 31, 1952, Serial No. 269,211

34 Claims. (Cl. 118—56)

1. An apparatus for coating hollow metal objects having an opening into the interior thereof, comprising a tank of molten metal having a portion thereof covered with molten flux, means for grasping a hollow object to be coated and carrying it through an arcuate path extending from a point above the portion of the molten metal covered with flux to a point beneath the portion of molten metal not covered by flux wherein the object is entirely submerged in the molten metal, means entering the opening in the hollow object at the end of the arcuate path of the grasping and carrying means, said means removing the object from the grasping and carrying means while the object is entirely submerged in the molten metal, means carrying the object from the molten bath to a discharge point outside of the tank of molten metal and means acting simultaneously with the removing and carrying means leveling the coated metal on the object and removing the excess metal.

---



2,769,425

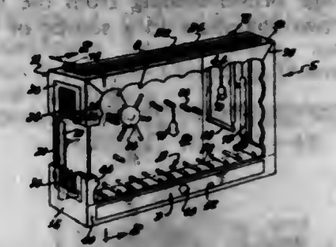
## LIQUID BATH ARTICLE TREATING FURNACE

Oscar R. Olson, Pittsburgh, Pa.

Application November 16, 1953, Serial No. 392,204

1 Claim. (Cl. 118—429)

A kettle structure for a bath type heating furnace comprising an outer kettle having bottom and side and end walls defining a chamber to contain heated liquid, an inner structure in said kettle having side and end walls spaced respectively from the corresponding walls of said outer kettle and defining an inner enclosure for retaining heated liquid separated from said outer chamber, a plurality of bridge members secured to the outer side of said inner wall in spaced relation to each other, each bridge member in the form of a right angle bracket having a wide horizontal leg section and a wide vertical leg section both of which stand vertically in a single plane medial to the plane of said enclosure wall to which it is attached, the width of each of the vertical leg sections correspond to the desired spacing of the inner wall from the corresponding outer kettle wall and each of said horizontal leg sections bearing on said kettle rim to hold said inner wall raised above said kettle rim.



2,769,426

## PARAKEET SHELTER

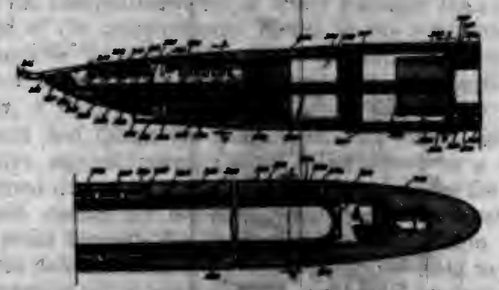
Russell W. Bromley, Long Beach, Calif.

Application June 13, 1955, Serial No. 515,670

6 Claims. (Cl. 119—17)

1. A bird shelter adapted to be removably affixed to a vertical wall surface, including: a drawer adapted to receive excrement of birds disposed in said shelter; an elongate rectangular frame defined by two vertical end pieces that are rigidly connected by a horizontal top piece and a horizontal lower portion in which said drawer is slidably mounted; means disposed in the forward portion of said frame that permit the interior of said frame to be viewed but prevent the escape of said birds therefrom; a plurality of parallel spaced pegs disposed above said drawer that divide said frame into upper and lower compartments, which pegs are spaced sufficiently close together that said birds cannot move downwardly therebetween to escape from said shelter when said drawer is removed therefrom; a rigid rectangular panel extending across the rearward portion of said frame, to which panel said frame is rigidly affixed, with said panel also serving to support said pegs in said spaced relationship; and means to removably support said panel from said wall surface.

---



2,769,427

## WRITING IMPLEMENTS

Lynn P. Martin, Fort Madison, Iowa, assignor to W. A. Sheaffer Pen Company, Fort Madison, Iowa, a corporation of Delaware

Application November 17, 1951, Serial No. 256,897

10 Claims. (Cl. 120—47)

10. A fountain pen comprising a casing, a feed bar mounted forwardly of said casing having a longitudinal bore extending therethrough, a writing nib mounted on said feed bar, said feed bar having a transverse capillary path connecting said bore and said nib, a cartridge unit supported for longitudinal reciprocation within said casing including a reservoir section and a substantially straight filling tube rigidly secured to said section projecting forwardly thereof and extending through said bore, the forward end of said tube being movable to positions forwardly and rearwardly of the forward end of said writing nib upon reciprocation of said unit, said filling tube having a longitudinal passageway with an open forward end providing an unobstructed vent extending therethrough and having a transverse opening in the forward end thereof providing communication between the interior of said reservoir section and said transverse capillary path when said unit and the forward end of said tube are moved to a rearward position, and means for reciprocably moving said reservoir and filling tube as a unit within said casing between said forward and rearward positions.

2,769,428

## PENCIL SHARPENERS

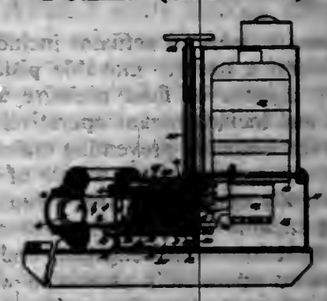
Richard A. Ossanian, Arlington, Mass.

Application July 12, 1955, Serial No. 521,445

13 Claims. (Cl. 120—96)

1. A pencil sharpener comprising a hollow, cylindrical outer casing, a first hollow, cylindrical sleeve axially slidable within said casing, a coil compression spring in said casing resiliently urging said first sleeve toward one end of said casing, sharpening means mounted on the end of said first sleeve adjacent said one end of said casing, and a filings collector comprising a second hollow, cylindrical sleeve mounted on the other end of said casing and extending concentrically into said first sleeve and concentric with but spaced inwardly from the interior wall of said casing, said first sleeve being slidable in the space between said casing and said second sleeve and said spring being disposed in said space and acting between said other end of said casing and the other end of said first sleeve.

---



2,769,429

## HYDRAULIC DEVICE AND TRAVEL LIMIT VALVE

Louis J. Leuciani, Menlo Park, Calif., assignor to Lawrence H. Cook, doing business as Cook Research Laboratories, Menlo Park, Calif.

Application July 10, 1953, Serial No. 367,257

1 Claim. (Cl. 121—38)

In combination with a single, stationary cylinder having a first head at one end thereof and a plunger reciprocable within said cylinder with a space between said head and said plunger for liquid under pressure; a second head at the end of said cylinder opposite to said first head and said plunger having an extension of reduced diameter rigid therewith slidably extending through said second head, a spring around said extension reacting between said plunger and said second head for yieldably urging said plunger toward said first head and said second head including a portion in opposed relation axially of said cylinder to said plunger for holding said plunger in said cylinder, an outlet in said first head coaxial with said plunger and a valve element supported on said plunger in axial alignment with said outlet for movement relative thereto, a spring reacting between a portion of said

plunger and said element for yieldably urging said element to a position closing said outlet during movement of said plunger to a predetermined point away from said first head, an inlet in said first head for admitting liquid under pressure into said space, means respectively on said plunger and on said element movable into engaging relation upon movement of said plunger to and past said point for moving said element away from said outlet upon movement of said plunger past said point thereby opening said outlet, an outer wall enclosing said cylinder spaced therearound and connected with said first head and with said second head to provide a closed chamber for liquid around said cylinder, a conduit for oil communicating between said cylinder and said inlet and outlet a portion of which conduit comprises said chamber and said inlet and said outlet, an opening formed in said cylinder adjacent to said head communicating with said chamber, a valve element carried by said outer wall movable into and out of position closing said last mentioned opening for admitting liquid from said cylinder into said chamber and conduit upon actuation of said last mentioned element for movement to open position and means connected with said last mentioned element accessible from outside said wall for manual manipulation thereof, said inlet and said outlet being a common opening and said first mentioned valve element being a check valve in said conduit adapted to be intermittently opened upon liquid pressure in said conduit being greater than liquid pressure in said cylinder.

**2,769,430**

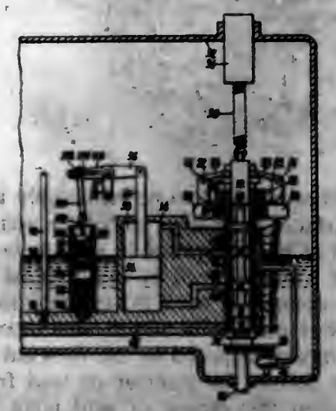
**ACTUATOR WITH DUAL LOCKING MEANS**

Howard M. Geyer, Dayton, Ohio, assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application August 31, 1953, Serial No. 377,534
20 Claims. (Cl. 121—40)

1. A fluid pressure operated actuator including in combination, a cylinder, a lineally movable piston disposed in said cylinder capable of fluid pressure actuation in either direction, and locking means operatively connected with said piston for normally preventing movement thereof, said locking means comprising a pair of tandem arranged, independently operable locking means, each locking means being capable of preventing movement of the piston in both directions when engaged, and fluid pressure actuated means operatively associated with each of said pair of locking means for releasing the same.

---



**2,769,431**

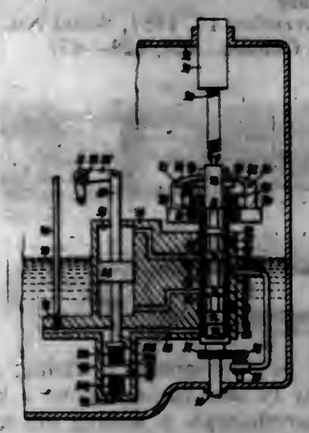
**HYDRAULIC GOVERNOR COMPENSATION SYSTEM**

Albert G. Massey, Watertown, N. Y., assignor, by mesne assignments, to Curtiss-Wright Corporation, New York, N. Y., a corporation of Delaware

Application September 27, 1955, Serial No. 536,931
15 Claims. (Cl. 121—42)

1. A hydraulic governor comprising a hydraulic pressure operated regulator member, a source of operating fluid pressure therefor, a pilot valve movable in opposite directions to connect said fluid pressure source to move said regulator member in opposite directions, a fluid pressure chamber and a piston movable directly with said pilot valve for compressing and expanding said chamber upon movement of the pilot valve in opposite directions, a compensating chamber and a piston therein movable to compress and expand said compensating chamber, said two chambers being in continuous fluid communication, an adjustable leakage orifice leading from the fluid system including said two chambers to a source of fluid under

substantially no pressure, resilient means acting on said compensating piston for yieldably tending to retain the same in a neutral position, and means movable by and with the regulator member and acting upon said resilient means to vary the neutral position of said compensating piston in response to movement of said regulator member.



---

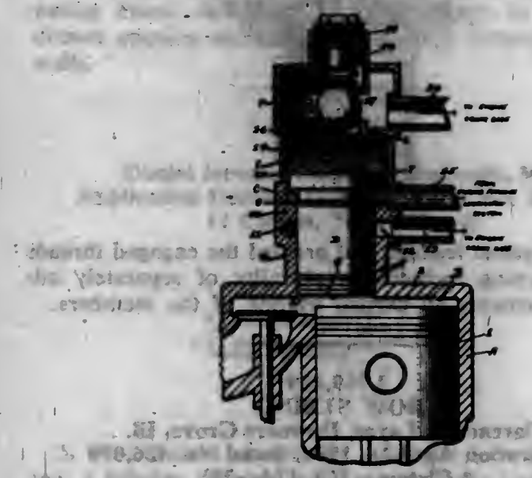
**2,769,432**

**HYDRAULIC GOVERNOR COMPENSATION SYSTEM**

Albert G. Massey, Watertown, N. Y., assignor, by mesne assignments, to Curtiss-Wright Corporation, New York, N. Y., a corporation of Delaware

Application September 27, 1955, Serial No. 536,932
4 Claims. (Cl. 121—42)

1. A hydraulic governor comprising a hydraulic pressure regulator cylinder and a piston movable therein, a source of operating fluid pressure therefor, a pilot valve movable in opposite directions to connect said fluid pressure source to move said regulator piston in opposite directions, a fluid pressure chamber and a piston movable directly with said pilot valve for compressing and expanding said chamber upon movement of the pilot valve in opposite directions, a compensating cylinder coaxial with said regulator cylinder and a piston therein movable to compress and expand said compensating cylinder chamber, said two chambers being in continuous fluid communication, an adjustable leakage orifice leading from the fluid system comprising said two chambers to a source of fluid under substantially no pressure, normally balanced opposed springs acting against opposite sides of said compensating piston for yieldably tending to retain the same in a neutral position, a connecting rod extending from said regulator piston into said compensating cylinder and having means acting against one of said springs to vary the neutral position of said compensating piston upon movement of said regulator piston.



---

**2,769,433**

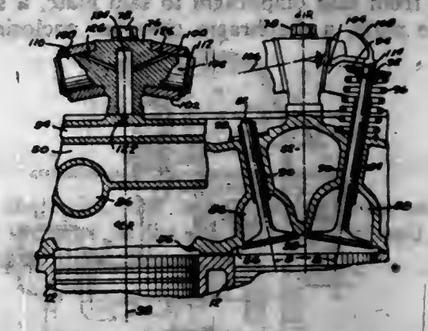
**INTERNAL COMBUSTION ENGINE**

Ira B. Humphreys, Denver, Colo., assignor to The Humphreys Investment Company, Denver, Colo., a corporation of Colorado

Application May 11, 1949, Serial No. 92,710
8 Claims. (Cl. 123—48)

1. In an internal combustion-type engine having a combustion chamber, means for automatically increasing and decreasing the volume of the combustion space within the chamber said means comprising, a compartment having an open lower end communicating with the combustion chamber, a control piston closing the lower end of the compartment and movable therein toward and away from the combustion chamber, the upper end of said compartment being provided with an outlet opening, a valve normally closing said opening, the control piston provided with a head disposed in the upper end of the compartment but of lesser diameter than the upper end of the compartment, means in the compartment engageable by said piston head to limit the travel of the control piston in a direction toward the combustion chamber, a fluid confined in the upper end of the compartment and filling the same, yieldable means holding the valve against opening only in response to a predetermined degree of pressure exerted upon it by the confined fluid, means for delivering fluid to the compartment at a point beneath the head of the control piston, and said fluid delivery means operating to deliver fluid to the compartment at a pressure less than the highest pressure obtained in the combustion chamber.

---



**2,769,434**

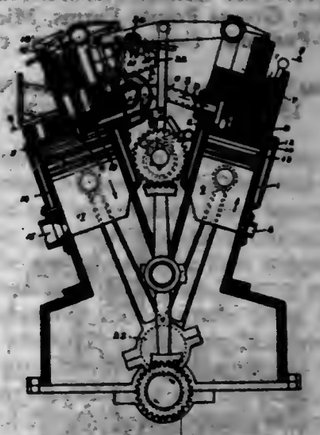
**OVERHEAD VALVE ARRANGEMENT FOR ENGINES**

Julius E. Witzky, Royal Oak, Mich., assignor to Studebaker-Packard Corporation, Detroit, Mich., a corporation of Michigan

Application November 4, 1953, Serial No. 390,190
15 Claims. (Cl. 123—59)

1. In an inline portion of an overhead valve engine provided with pluralities of cylinders and a cylinder head for the individual pluralities of cylinders, a cylinder included in said inline portion of one of said pluralities having a pair of valve actuating rocker arms, and having valve means individual to said rocker arms and rocker pedestal means in common to said rocker arms, stub shafts carried at the sides of said pedestal means and affixed thereto for journalling said rocker arms for oscillatory movement, said valve means and stub shafts each being of a number corresponding to said rocker arms with the axes of the former means being diagonally related

to one another and disposed substantially in the plane of the cylinders of said one plurality and the axes of the latter being diagonally related to one another.



---

**2,769,435**

**TWO STROKE CYCLE INTERNAL COMBUSTION ENGINE WITH PUMP COMPRESSION**

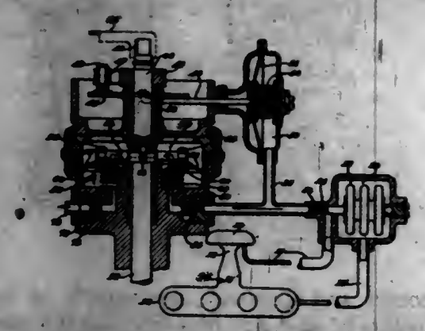
Charles E. Cass, Roseburg, Oreg.

Application February 28, 1951, Serial No. 213,109
9 Claims. (Cl. 123—68)

1. In an internal combustion engine, a power cylinder having a piston reciprocatively operative therein, an air compression cylinder having a piston reciprocatively operative therein, means providing a passage directly connecting the cylinders solely through their heads for a direct delivery of compressed air from the compression cylinder to the power cylinder, a normally closed spring-loaded pressure-controlled check valve operative in the inlet end of said passage, a normally closed spring-loaded poppet valve operative at the discharge end of said passage, an inlet port for fuel under pressure at the head of the power cylinder, a normally closed spring-loaded poppet valve operative at said fuel inlet port, and means arranged for actuation in cyclic synchronism with the movement of the piston of the power cylinder to successively open the fuel inlet valve and the air inlet valve when and after the piston has reached the limit of its stroke adjacent the head.

---

**2,769,436**

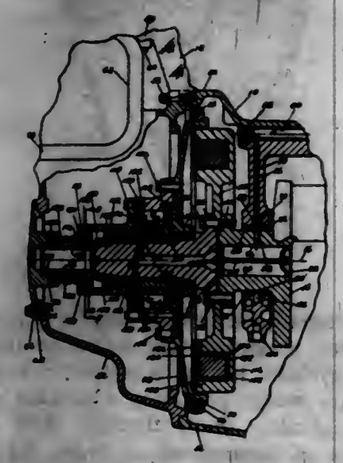


**IGNITION DEVICE**

Melvin F. Sterner, Royal Oak, Mich., assignor to Holley Carburetor Company, Detroit, Mich., a corporation of Michigan

Application October 9, 1953, Serial No. 385,177
2 Claims. (Cl. 123—117)

1. In an ignition system for an internal combustion engine, a drive shaft driven by said engine, vacuum air pump operated thereby having an air entrance and a restriction in said air entrance through which atmospheric air is admitted to said pump, a circuit breaker, a plate

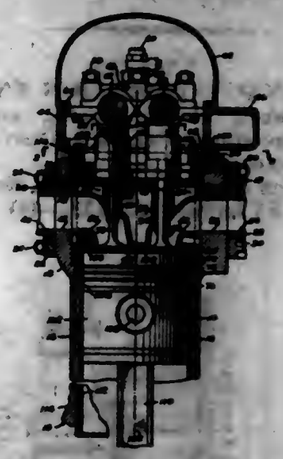


supporting said circuit breaker, a cam driven by said engine and engaging said circuit breaker, a diaphragm, a link from said diaphragm to said plate, a spring rotating the plate, a diaphragm chamber enclosing said dia-

phragm, a passage from said chamber to the suction side of said pump connected to the downstream of said restriction so that the pressure in said diaphragm chamber falls as the speed of the engine increases and the spark is advanced.

---

2,769,437
STARTER GEAR MECHANISM
Ross E. Taylor, Grosse Pointe Farms, Mich., assignor to Studebaker-Packard Corporation, a corporation of Michigan
Application September 1, 1954, Serial No. 453,658
15 Claims. (Cl. 123—179)



1. In combination, a starter ring gear, an engine crankshaft to be started in motion thereby and concentric therewith, and one-way means for drivingly connecting the crankshaft for rotation in one direction conjointly with the starter ring gear at all speeds of the latter tending to exceed the speed of the crankshaft comprising friction engaging elements carried by a portion of the ring gear engageable to couple together the starter ring gear and the crankshaft in non-return drive.

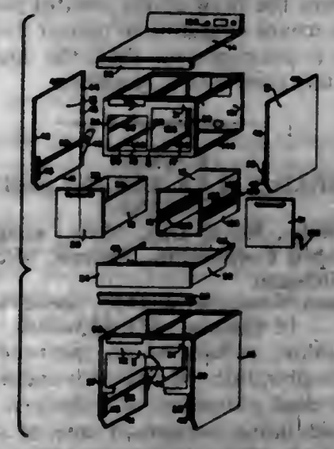
---

2,769,438
CYLINDER HEAD RETAINER
Julius E. Witzky, Royal Oak, Mich., assignor to Studebaker-Packard Corporation, a corporation of Michigan
Application December 2, 1953, Serial No. 395,734
10 Claims. (Cl. 123—193)

1. In a multi-cylinder engine each cylinder of which is adapted to receive a central liner and is provided with spaced apart shoulder and threaded portions inside one end of the cylinder, means individual to said cylinders and each including a first member internally received in the one end of one cylinder, said first member being disposed adjacent said shoulder portion and having a seal clamped therebetween, a second member in threaded engagement with said threaded portion in closely spaced adjacency to the first member, and means for separating said members under prestressed conditions so as to crush

said seal against leakage and preload the engaged threads against turning including a plurality of separately adjustable elements all carried by one of the members.

---

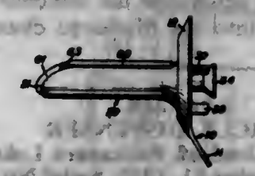


2,769,439
BOW STRING
Clarence L. Layer, Downers Grove, Ill.
Application April 28, 1954, Serial No. 426,090
4 Claims. (Cl. 124—30)

1. An archery bow string having a multistrand endless string body with a portion of the body subjected to abrasion in use and having a reinforcing tubular structure encasing the same without interference with the relative longitudinal movement of the strands to equally distribute stresses to which the bow string is subjected in use.

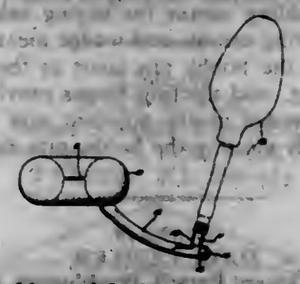
---

2,769,440
DOMESTIC APPLIANCE
George C. Pearce, Dayton, Ohio, assignor to General Motors Corporation, Dayton, Ohio, a corporation of Delaware
Original application September 1, 1945, Serial No. 613,982. Divided and application April 27, 1951, Serial No. 223,191, now Patent No. 2,632,434, dated March 24, 1953. Again divided and this application October 21, 1952, Serial No. 315,901
2 Claims. (Cl. 126—39)



1. A range including a box shaped generally rectangular frame provided with a substantially vertical dividing wall extending substantially from top to bottom intermediate its ends to divide the interior of the frame into two compartments, support means at the ends of said frame extending to the floor, two doors located side by side closing the fronts of said two compartments and having their edges overlying front portions of said frame, a single bottom drawer extending entirely beneath said frame and said dividing wall between said support means and provided with a front having its end edges overlying said support means and having its upper edge extending substantially to but just out of contact with the lower edges of said two doors, and a range top extending over said frame, said frame extending across and being suspended by said side panels above said single bottom drawer and having the lowest portion of its center terminating above said single bottom drawer to provide a drawer opening extending continuously between said side walls.

---



2,769,441
SPECULUM
Daniel Jerome Abramson, Bethesda, Md.
Application October 22, 1954, Serial No. 463,990
11 Claims. (Cl. 128—4)

5. A speculum comprising a handle having an opening, a tubular viewing member rotatively seated in said opening, and a deformable resilient ring pressed into said opening against said viewing member to releasably hold the handle and viewing member together while permitting rotation of the viewing member.

---

2,769,442
VALVE FOR INFLATABLE PESSARIES AND THE LIKE
George Stubbs, Los Angeles, Calif.
Application May 27, 1955, Serial No. 511,592
2 Claims. (Cl. 128—127)

2. An inflatable article having a tubular rubber stem connected thereto and in communication with the interior of the article, said stem having a closed end adjacent which there is a laterally extending inlet, and a ball adapted to occupy the closed end of the stem on one side of the inlet to enable the article to be inflated through the inlet, said ball being capable of being forced across the entrance to the inlet and to occupy a frictionally held position in the stem on the other side of the inlet so as to retain the article in inflated condition.

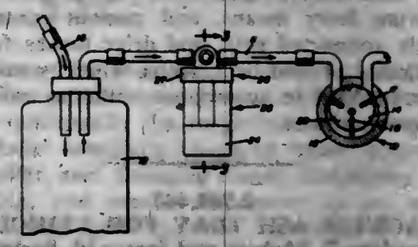
---

2,769,443
HYPODERMIC DEVICES
Russell P. Dunsmire, Cheerio Falls, Ohio
Application September 29, 1954, Serial No. 459,188
12 Claims. (Cl. 128—216)

1. A hypodermic device comprising a shell having a relatively thick, rigid, end wall and relatively thin, flexible, side walls defining a fluid reservoir, and an integrally formed annular flange on the inner surface of the end wall; a hypodermic needle having a head portion and a shank portion with a hollow bore, the head portion being secured to said end wall by said annular flange for

movement therewith, and a passageway from said reservoir into the bore of the shank portion of said needle adjacent the butt end thereof.

---

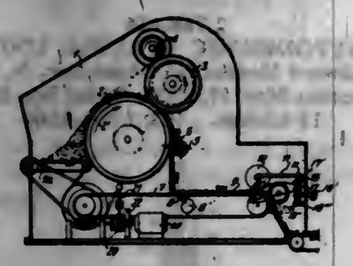


2,769,444
HYPODERMIC SYRINGE UNIT
Edward Henderson, Montclair, N. J.
Application May 17, 1952, Serial No. 288,422
11 Claims. (Cl. 128—216)

1. A hypodermic syringe unit comprising: a compressible barrel member formed with a chamber having an ingredient therein and with a dispensing aperture communicating with the chamber; a capsule containing a second ingredient to be mixed with the first ingredient disposed in said chamber and occupying only a portion of the space of the chamber, said capsule being impervious to either of the aforesaid ingredients but being frangible under manual pressure whereby the capsule can be broken to mix the ingredients; and a filter positioned between the capsule and the dispensing outlet to protect the outlet from broken fragments of the capsule.

---

2,769,445
OIL MIST LUBRICATOR FOR SUCTION DEVICES
Gaetano A. Morgavi, Jr., New Orleans, La., assignor of one-half to Edward J. Hamback, New Orleans, La.
Application December 14, 1953, Serial No. 398,033
6 Claims. (Cl. 128—278)

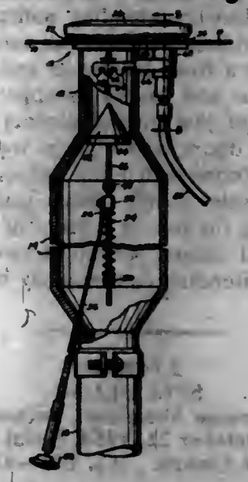


1. An automatic lubrication system comprising a suction line, a compressor connected with its suction side to the said suction line, a surgical apparatus for evacuating substances from the human body connected with the said suction line, a lubricant container filled with a lubricant, having a top portion divided into two separate compartments, one of said compartments being connected with the atmosphere by means of a restricted connection and being further connected with the bottom of the container, the other compartment being connected with the top of the container, on one side and with the suction line on the other side, air being sucked into the suction line to the last named compartment connected with the top of the container and through the first named compartment

having a restricted connection with the atmosphere through its connection with the bottom of the container, the air entering through the lubricant filling the container containing particles of the lubricant and forming a mist while drawn into the suction line.

---

2,769,446
**TOBACCO OPENERS FOR CIGARETTE MAKING MACHINES**
Hans Deak, Vienna, Austria
Application May 21, 1953, Serial No. 356,392
Claims priority, application Germany June 14, 1952
3 Claims. (Cl. 131—110)



1. In a tobacco opener for producing a tobacco sliver and feeding it to a cigarette forming device, an endless sifter belt means, drive means, means operatively connecting said drive means with said belt means for driving said belt means continuously in one direction, supply means associated with said belt means for delivering a stream of tobacco to the top side of said belt means for transport by said belt means in the form of a sliver towards a discharge place, suction cup means adjacent said belt means at the underside thereof in the vicinity of the supply place of said belt means, means for creating suction in said suction cup means to act on said sliver through said belt means, a series of rollers arranged coaxially and extending transversely above said belt means, pivoted levers for each of said series of rollers adapted to support the same so that the rollers will rest on said sliver, sliver thickness indicator means, fulcrum lever means operatively connecting the levers of said rollers resting on the sliver with said indicator means to cause said indicator means to move in one direction when the thickness of the sliver passing beneath said series of rollers resting thereon increases and in the opposite direction when said thickness decreases, said fulcrum lever means being fulcrumed intermediate its ends and the levers of said rollers operatively engaging the ends of said fulcrum lever means, and manual control means operatively connected with said drive means for control of the velocity of said belt means, whereby said velocity may be controlled in accordance with the indication on said indicator means.

---

2,769,447
**VACUUM ASH TRAY FOR VEHICLES**
Theodore E. Moberg and James M. Seckman, Tacoma, Wash.
Application January 21, 1955, Serial No. 483,235
3 Claims. (Cl. 131—256)

1. A vacuum receiver for smokers' material comprising an extinguishing chamber having a mouth for the reception of the material, a substantially air-tight cover superimposed over the mouth, hinge means for attaching the cover to the chamber, conduit means communicating with the chamber and adapted for attachment to a source of vacuum, valve means in the conduit means operable by movement of the lid, a discharge chamber below and communicating with the extinguishing chamber, and discharge valve means releasably sealing the extinguishing chamber from the discharge chamber and operable in one position to seal the discharge chamber from the extinguishing chamber for evacuating the latter and in

a second position to discharge the contents of the extinguishing chamber into the discharge chamber.

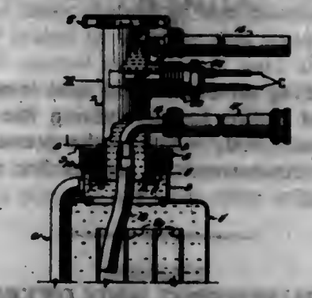
---

2,769,448
**ARTICLE DISPENSER**
Raymond A. Uhlendorf, Pachaquack Lake, N. J.
Application December 11, 1953, Serial No. 397,699
11 Claims. (Cl. 132—1)

1. In a bobby pin dispenser of the class described, a housing for receiving a supply of bobby pins and comprising a plurality of bounding walls one of which is resilient, a track in said housing for receiving the bobby pins, ejecting means for dispensing the bobby pins from the housing, yielding means for urging said bobby pins toward said ejecting means, and wedge means for spreading the tines of the bobby pin apart as they are ejected from the housing, said ejecting means moving the bobby pins past said wedge means adjacent said resilient wall and automatically ejecting the bobby pins from the housing.

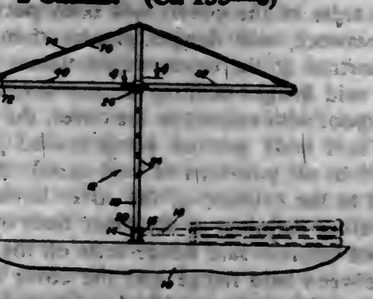
---

2,769,449
**HAIR CURLER**
James Vincent Portell, Washington, D. C.
Application August 18, 1953, Serial No. 374,982
6 Claims. (Cl. 132—42)



1. A curler comprising a substantially circular base having a generally flat lower surface and a generally concave upper surface with the medial point of said upper surface being closer to the lower surface than the outer perimeter thereof, a central column positioned on said upper surface and extending upwardly therefrom, said column having a longitudinal central chamber open at both ends, opposed slots extending through said column from the outside to said chamber, said base having a central opening extending therethrough in alignment with one open end of said chamber, said base having slots formed in the outer perimeter each of the latter slots being in substantial alignment with one of the first mentioned slots, means forming spaced upstanding projecting elements adjacent the outer perimeter of said base intermediate the slots thereon, a clamping device removably in clamping engagement with said base intermediate said column and at least two of said projections, and a resilient tensionable element removably retained in said column and extending downwardly through said base and being capable of being positioned in said slots in said base and having frictional engagement with said slots in said column.

---



2,769,450
**ENGINE COOLING SYSTEM CLEANER**
Harold T. Colby, Cudahy, Wis.
Application September 10, 1951, Serial No. 245,775
1 Claim. (Cl. 134—57)

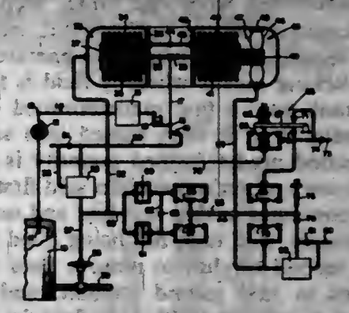
A cleaning device for attachment to the filling neck of a radiator in the cooling system of an internal combustion engine provided with a fluid circulating pump, said device comprising a tubular fitting, a removable cap for the upper end of said fitting, means for attaching the lower end of said tubular fitting on the filling neck of said radiator, ducts at the upper and lower ends of said fitting for introduction and discharge of a flushing liquid into the radiator, one of said ducts adapted to extend down into the body of the radiator, a thermostatic switch extending into said tubular fitting, and means operatively connected to the thermostatic switch and operative in response to the operation thereof to interrupt the ignition system of the engine to prevent overheating of said cleaning fluid.

---

2,769,451
**BOAT SHADE**
James O. Edgin, Edna, Tex.
Application August 19, 1954, Serial No. 451,002
2 Claims. (Cl. 135—6)

1. A boat shade comprising a substantially U-shaped support member including a pair of spaced legs interconnected by an upper cross member, a pair of brackets slidably adjustably mounted on said legs, a pair of U-shaped arms, each of said arms being pivotally attached to said brackets, and a covering secured to said arms and overlying said upper cross member, and means for locking said brackets in a selected position relative to said legs, said means for locking each bracket including an actuation member threadedly secured in said bracket, a latch pivotally mounted in said bracket engaged by said actuation member, and a plurality of spaced apertures in said legs, said actuation member urging said latch into a selected one of the apertures in said legs, and a spring attached to said latch for retracting said latch from said selected one of said apertures, each of said brackets including pairs of spaced ears, said arms being received between said spaced ears.

---



2,769,452
**WEIGHT AND VALVE STEM ASSEMBLIES**
Walter L. Gill, Redlands, Calif.
Application June 1, 1953, Serial No. 512,530
5 Claims. (Cl. 137—39)

1. In combination a valve stem of the character described comprising a rubber body portion and a lower acid resistant metal portion, said metal portion comprising a valve head upon its lower end, a protuberant head upon its upper end and an intermediate abutment, the upper portion of the rubber body portion being solid and provided with spaced upper and lower laterally protuberant integral abutments, the metal portion above its abutment, entering and lying axially within the rubber portion with the lower end of the rubber portion in contact with the upper face of the abutment of the metal portion of the stem.

---

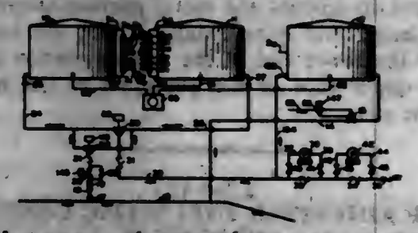
2,769,453
**SELF ADJUSTING PNEUMATIC CONTROL APPARATUS**
Robert C. Du Bois, Fairfield, Conn., assignor to Minneapolis-Honeywell Regulator Company, Minneapolis, Minn., a corporation of Delaware
Application October 8, 1954, Serial No. 461,102
15 Claims. (Cl. 137—86)

1. Apparatus for regulating a variable comprising a controller for producing an output control action which follows proportionally the magnitude of an input variable, controller sensitivity changing means connected to said controller, said changing means comprising a pneumatic spring, and means responsive to an aperiodic variation of the input variable connected to supply a pneumatic pressure to said fluid spring to increase the sensitivity of said controller.

---

2,769,454
**PRESSURE CONTROL FITTINGS**
Ralph E. Bletcher and Irving A. Ward, Los Angeles, Calif., assignors to Modern Faucet Mfg. Co., Los Angeles, Calif., a corporation of California
Application January 13, 1954, Serial No. 403,762
3 Claims. (Cl. 137—119)

1. A pressure control fitting for use in a chamber having a pair of opposed outlets and an inlet comprising: a shoulder formed in the first outlet, a carrier projecting from the second outlet and terminating short of said

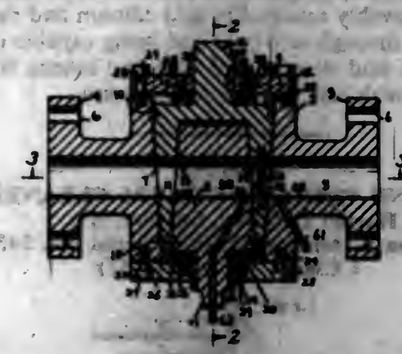


shoulder, a wafer having a surface bearing against said shoulder and spaced legs engaging the upper extremity of said carrier whereby flow is permitted from outside

said carrier to the interior thereof, means forming a bore in said wafer communicating said first and second outlets and valve means responsive to flow through said second outlet for closing off said bore.

---

2,769,455
TANK SWITCHING SYSTEM
Phillip S. Massey, Dewey, Okla., and Robert C. Reilly, La Junta, Colo., assignors to Phillips Petroleum Company, a corporation of Delaware
Application December 21, 1953, Serial No. 399,341
11 Claims. (Cl. 137—122)



1. Fluid storage and removal apparatus comprising, in combination; first and second storage tanks; a first conduit adapted to pass fluid to be stored into said tanks; first switching means to connect said first conduit selectively to said first and second tanks; a second conduit adapted to remove fluid from said tanks; second switching means to connect said second conduit selectively to said first and second tanks; means to operate said first and second switching means whereby fluid is first passed into said first tank until a first predetermined quantity is positioned therein, fluid is then passed into said second tank until a second predetermined quantity is positioned therein, fluid is once again passed into said first tank, and said switching continues so that said first and second tanks are filled alternately, said tank not being filled being connected to said second conduit to remove fluid therefrom; pumping means in said second conduit; and switching means actuated by the quantities of fluid in said tanks whereby said pumping means is actuated when the fluid in said tank to which said second conduit is connected exceeds a predetermined quantity.

---

2,769,456
COMBINATION PLUG VALVE AND ORIFICE HOUSING
Roy L. Atkinson, Pasadena, Tex.
Application July 12, 1955, Serial No. 521,480
5 Claims. (Cl. 137—268)

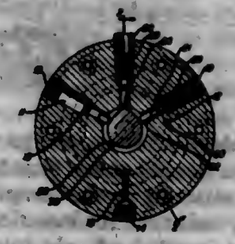
1. A combination valve and orifice support including a body having an aperture extending longitudinally therethrough, means on each end of said body for securing it in a flow line to communicate the aperture with the flow line for flow through said body, said body having an opening extending laterally thereof and intersecting said aperture substantially mid-way between the ends thereof, inner and outer concentrically arranged plugs fitting within said opening, each of said plugs having a stem whereby they may be rotated relative to each other and relative to said body, said plugs each having openings therethrough of substantially the same size as the aperture in said body, said outer plug having orifices mounted therein for directing fluid from said aperture therethrough, there being an opening through said valve body for conducting the fluid pressure upstream of said orifice exteriorly of said

body, there being an opening in said inner plug downstream of said orifice for conducting the fluid pressure exteriorly of said body whereby the pressure differential upstream and downstream of said orifice may be instrumentally noted.

---

2,769,457
COMBINED VENTING AND OVERPRESSURE RELEASE VALVE
Edward H. Wittenberg, La Crosse, Wis., assignor to National Presto Industries Inc., Eau Claire, Wis., a corporation of Wisconsin
Application June 1, 1953, Serial No. 358,811
7 Claims. (Cl. 137—512)

2. A combined venting and over-pressure release valve for pressure cookers having an aperture in the cover thereof, comprising a resilient spool including a body portion of a size smaller than the aperture to be movably received in the aperture and a pair of flanges of a size larger than the aperture extending outwardly from the opposite ends of said body portion to be disposed to the opposite sides of the cover, said body portion being of a length between said flanges greater than the thickness of the portion of the cover within which the aperture is formed, said flanges defining normal limits of movement of said spool with respect to the cover, the peripheral surface of said body portion being spaced from the aperture wall in all positions of said spool, the flange to be disposed to the exterior of the cover having an irregular inner surface defining, at the inner limit of movement of said spool wherein said flange rests on the cover, air passages between said flange and the cover communicating with the space between said body portion and the aperture wall, the flange to be disposed to the interior of the cover being spaced from the inner surface of the cover at the inner limit of movement of said spool, the last-named flange being flexible and responsive to a predetermined range of pressures in the cooker to move said spool to its normal outer limit of movement and to force the inner surface of said flange into sealing engagement with the inner surface of the cover, said last-named flange being flexible and responsive to pressures in the cooker in excess of a predetermined maximum to be flexed and ejected from the cooker cover, the spacing of the peripheral surface of said body portion from the aperture wall accommodating said flexing.



2,769,458
PUMP CHECK VALVE
Herbert L. Misch, Royal Oak, Mich., assignor to Studebaker-Packard Corporation, a corporation of Michigan
Application October 28, 1952, Serial No. 317,285
5 Claims. (Cl. 137—512)

5. A valve device comprising a housing having two spaced apart inlets and an outlet communicating with the interior thereof, said outlet including a slot formed annularly about the inner surface of said housing, a U-shaped valve member seated in said slot and comprising one flat portion seated against one side of said slot and a bow shaped portion engaging in part with said other side of said slot whereby the flat portion of the valve can interrupt the communicating relation from one inlet to the outlet and the bow shaped portion can permit continuous communicating relation from the other inlet to the outlet.

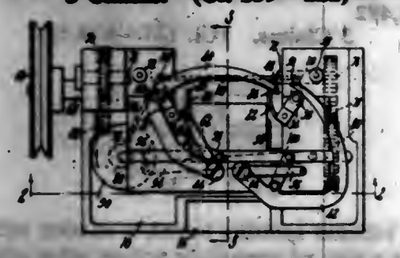
---

2,769,459
MULTIPLE SELECTOR VALVE
Harold A. Birkness, Homewood, and John P. Segers, Riverdale, Ill., assignors to Standard Oil Company, Chicago, Ill., a corporation of Indiana
Application March 2, 1953, Serial No. 339,647
3 Claims. (Cl. 137—607)

1. A multiple selector valve comprising a valve body of the disc type, a central hub on one face of said body, a central recess in said body below said hub, an axial bore through said hub communicating with said recess, a plurality of radially extending bores radiating from said central recess, a shoulder in each of said bores intermediate the ends thereof, a valve seat on each of said shoulders, a fluid distribution channel on the rear face of the valve body concentric with said central recess and communicating with all of said radial bores, an outlet channel means in said body communicating with said distribution channel, a backing plate for said valve body enclosing said annular channel and said central recess, gasket means between said backing plate and said valve body arranged concentrically with and radially beyond said distribution channel, a valve plug in each of said radial bores comprising a valve rod extending radially inward of said valve seat and into said central recess, a valve ring on said valve rod adjacent one end thereof and adapted to be seated on said valve seat, a flanged head on said valve rod on the outer end thereof adjacent said valve ring, a compression spring means acting on said head normally to retain said valve ring in contact with said valve seat, a cam means operating within said central recess, and a cam shaft means for rotating said cam to radially extend said valve rod whereby said valve ring is lifted from said valve seat against the action of said spring.

2,769,460
PIVOTED GATE VALVE
Frank H. Richterkessing, near Louisville, Ky., assignor to W. M. Cissell Manufacturing Company, Incorporated, Louisville, Ky., a corporation of Kentucky
Original application March 6, 1950, Serial No. 147,943. Divided and this application September 8, 1952, Serial No. 308,492
3 Claims. (Cl. 137—625.4)

1. In a vacuum spotting board, a suction control valve comprising a pair of oppositely ported valve plates having relatively spaced opposed parallel surfaces, and a movable valve element having the external surfaces thereof exposed to atmospheric pressure and including a first valve section pivoted to one of said plates for swinging movement between both of said plates and across the ports thereof, said valve section having a bore therethrough for registry with the port in said one plate in one position of said valve element and being closed by said one plate in a second position of said valve element, a second valve section having a bore therethrough for registry with the port in the other of said plates in said one position of said valve element, a sleeve connected to one of said sections in communication with the bore therein and slidably disposed in the bore of said other section, and an annular gasket of resiliently axially compressible material disposed about said sleeve between said respective valve sections urging said sections into resilient engagement with said respective plates while also providing a fluid seal between said respective sections.



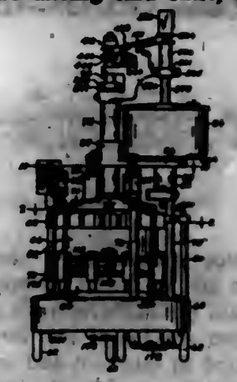
---

2,769,461
LOOM HARNESS
Frank H. Kaufmann, Huntingdon Valley, Pa., assignor to Steel Heddle Manufacturing Company, Philadelphia, Pa., a corporation of Pennsylvania
Application July 28, 1955, Serial No. 524,953
5 Claims. (Cl. 139—92)

1. In loom harness including a heddle frame having top and bottom rails and heddle supporting rods comprising thin flat metallic strips mounted in said frame, said rods being insertable therein and removable therefrom by sliding lengthwise, the means for supporting said rods intermediate the ends thereof comprising the provision, at each location, of a member secured to the rod, and a separate bolt member adjustably mounted in one of the rails of the frame; one of said members having a substantially U-shaped slot therein and the other of said members having a part extending into said slot to secure said members to each other, said members being separable upon sliding the rod lengthwise, and means for normally maintaining said members in locked engagement, the U-shape of the slot providing a spring tongue having a portion resiliently engaging the part which extends into the slot and maintains a constant pressure thereon when the parts are in their operative positions.

**2,769,462**
**NARROW WEB LOOM**
Carl F. Libby, Stoughton, Mass., assignor to John D. Riordan, Hopkinton, and Gertrude C. Libby, Stoughton, Mass.
Application July 27, 1955, Serial No. 524,667
3 Claims. (Cl. 139—122)

1. In a narrow web loom having shed-forming means, a needle on each side of the shed reciprocable a short distance forward and rearward, each said needle having an eye near its free end for a weft yarn, a weft-projecting finger at each side of the shed, each said finger having a forked end adapted to pick up a loop of weft yarn from the needle on the same side and to project said loop through the shed to the needle at the other side of the shed, and means for operating said needles and fingers in timed relation so that said needle at the other side of the shed is moved to project its loop through the loop brought through the shed by said finger just before said finger is retracted from the shed.



**2,769,463**
**LOOM STOP DEVICE**
Robert Blaise Delaney, Darien, Conn., assignor to Bates Manufacturing Company, a corporation of Maine
Application July 17, 1953, Serial No. 368,743
15 Claims. (Cl. 139—228)

1. In a loom for interposing a filling between selected warp ends and including an actuatable filling change mechanism and an actuatable loom stopping mechanism, a device comprising a filling detecting means movable when a filling is missed, a dog adjustable to either of two positions and movable bodily in response to the movement of said detecting means, said dog actuating said loom stopping mechanism when disposed in one position and actuating said filling change mechanism when in another position, means to detect the approaching exhaustion of the filling and then to actuate said filling change mechanism, and means responsive to said means when the latter actuates said filling change mechanism to move the dog temporarily from said one position to said other position.

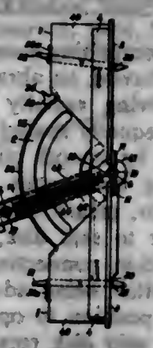
**2,769,464**
**CONTAINER FILLING APPARATUS**
Herbert F. Cox, Jr., Syracuse, N. Y.
Application December 10, 1951, Serial No. 260,873
46 Claims. (Cl. 141—86)

1. A container filling apparatus, comprising a base having an upstanding circular housing, a circular skirt arranged around the upper portion of said housing, an annular thrust bearing coacting between said skirt and housing for supporting the skirt for rotation around the housing on a vertical axis, a central hollow column mounted on said housing and projecting upwardly beyond the housing and skirt, a reciprocating actuating bar slidably mounted in said column and projecting beyond the upper end thereof, drive means within said housing for periodically angularly advancing said skirt, and actuating said

bar, means carried by said skirt for supporting a plurality of containers to move said containers in a circular path about said column, and means mounted on said column and overhanging said skirt and having mechanism actuated by said bar for filling containers carried by said skirt one at a time between periodical advancing of said skirt.

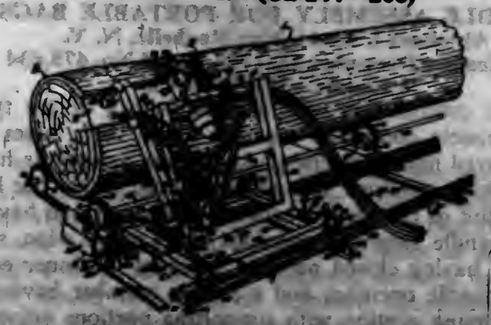
**2,769,465**
**STORAGE BATTERY WATERING DEVICE**
Gerald E. Maybach, Bowmansville, N. Y., assignor to Gould-National Batteries, Inc., St. Paul, Minn.
Application November 22, 1954, Serial No. 470,366
5 Claims. (Cl. 141—96)

5. A watering device for a storage battery having a filler opening and a hinged cover therefor formed with a horn portion, said watering device comprising a filler tube, a nozzle carried by said tube for insertion into the battery filler opening, said nozzle and said tube being arranged at substantially a right angle to each other, means providing an enlarged abutment adjacent the juncture of said nozzle with said tube for engaging the battery adjacent the filler opening when said nozzle is inserted therein, and means providing a socket portion at the outer end of said nozzle for engagement with the cover horn portion to tilt the cover to open position, said nozzle being provided with an angularly arranged slot in its side wall intermediate the opposite ends thereof, whereby said device will direct water into the battery so as to cause distinguishable audible signals under battery liquid low-level and high-level conditions.

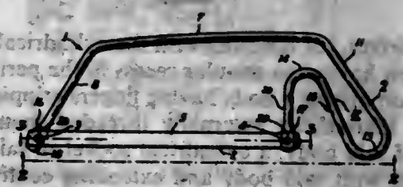


**2,769,466**
**LATHE ATTACHMENT**
Frank J. Brunsch, West Camp, N. Y.
Application July 8, 1954, Serial No. 442,830
6 Claims. (Cl. 142—7)

1. An attachment for a lathe having work supporting and rotating centers comprising a base slidably mounted on the lathe ways, a tool carrier slidably mounted on said base, a tool post mounted on said carrier for supporting a tool, a longitudinal bar secured to the lathe ways in spaced parallel relation thereto for supporting one end of said base, a longitudinal guide means mounted in spaced relation to the lathe ways, and follower means on said carrier and engaging said guide means for moving said carrier in transverse relation to the lathe ways thereby moving the tool post and tool in relation to the work positioned over the lathe ways upon longitudinal movement of the tool carrier.

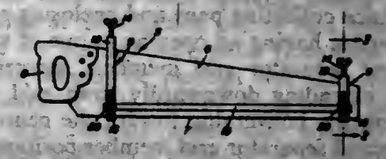


**2,769,467**
**MITER BOX WITH SWINGING SAW GUIDE**
Walter Wehrmann, Zurich, Switzerland
Application October 15, 1952, Serial No. 314,765
Claims priority, application Switzerland October 17, 1951
3 Claims. (Cl. 143—89)



1. A mitre box for adjusting a saw-blade at different angles to a work piece, comprising a base plate, a stop and guiding plate for the work piece, a graduated disc, a saw-blade adjusting lever rockable over said graduated disc, two guiding members fixed on said adjusting lever, one of said guiding members having its axis of rotation in the plane of said stop and guiding plate, said adjusting lever having a four-link hinged frame arranged beneath the base plate, for fixing said adjusting lever at any desired angle to said stop and guiding plate, the frame links being connected by a front pivot, a back pivot and two lateral pivots, a sliding device connecting the front pivot with said adjusting lever, the back pivot being rigid with said one of said guiding members, the two frame links connected to said back pivot having grippers at their respective ends, and two spring-influenced lockable setting levers rockably fixed beneath said base plate, said grippers being adapted to engage said setting levers respectively.

**2,769,468**
**LOG BARKER HAVING FLOP-OVER CUTTERHEAD**
Willis R. Swanson, Wichita, Kans., assignor to The Rennels & Porter Lumber Company, Inc., Wichita, Kans., a corporation of Kansas
Application January 13, 1953, Serial No. 330,946
17 Claims. (Cl. 144—208)



1. In a log barker, a frame, a debarking head rotatably mounted thereon, said head having a cylindrical casing equipped with a plurality of knives extending radially therefrom and oriented in spaced circumferential rows, said knives also being staggered and angularly disposed relative to said head so that the cutting edges of said knives, when a profile is taken thereof along a longitudinal line on said casing substantially parallel to the rotational axis of said head with a knife in each row assumed to be positioned on said line, form a generally arcuate configuration, whereby upon operation of said log barker, a swath of bark is chipped from a log, and means for adjustably controlling the angular position of said frame for setting the depth of cut made by said knives.

**2,769,469**
**RESILIENT ROD SAW FRAME**
John A. Budnick, Cleveland, Ohio
Application February 7, 1955, Serial No. 486,500
3 Claims. (Cl. 145—33)

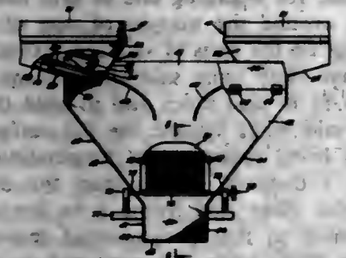
1. An integral one-piece saw frame for a longitudinal hack saw blade having an attaching hole at each end thereof and having flat side faces located in parallel planes, said frame comprising a single relatively stiff resilient metal rod of substantially uniform cross-sectional area throughout its length forming a longitudinally-extending back member that is curved at each end to form a leg at one end thereof and a handle and leg at the opposite end thereof, said legs being aligned so that the axes thereof are located substantially in a single plane and extend generally transversely to said back member, each of the ends of said legs remote from said back member being provided with a blade-attaching lug projecting outwardly in a direction substantially perpendicular to said single plane and a substantially flat surface around said lug adjacent to and substantially parallel to said single plane for engaging one of said flat side faces of said blade around the margin of one of said holes therein, the lugs on the ends of said legs extending in opposite directions away from said single plane and being constructed to fit in said holes and to hold the opposite side faces of said blade against the flat surfaces of said legs, said lugs being spaced apart longitudinally of said back member a distance greater than the distance between said holes when said frame is in the normal unstressed condition so that a substantial tension will be applied to said blade when it is mounted on said frame.

**2,769,470**
**HAND SAW DEPTH GAUGE**
Roy J. Akers, Portsmouth, Ohio
Application March 8, 1955, Serial No. 492,865
4 Claims. (Cl. 145—35)

1. A hand saw depth gauge comprising: a pair of clamps adapted to be mounted on the end portions of a saw blade, said clamps including tubes adapted to be slipped longitudinally on the blade and having slots therein for the passage of said blade, hand screws threadedly mounted on one end of the tubes and engageable with the blade for securing the tubes thereon, a depth bar

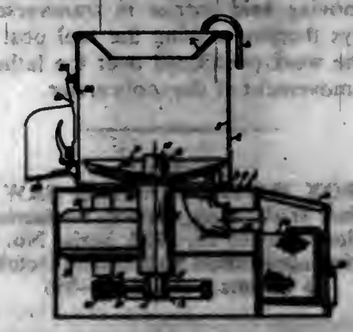
having its end portions secured to the tubes, said depth bar substantially paralleling the cutting edge of the blade and being engageable with the work, and means for adjusting said depth bar on the tubes.

---



2,769,471
HAND TOOLS FOR OPERATING WORM GEARED BAND CLIPS
Charles William Cheney, Hockley, Birmingham, England
Application March 9, 1953, Serial No. 341,003
Claims priority, application Great Britain March 15, 1952
1 Claim. (Cl. 145—50)

A screw-driver, for coacting with the cylindrical head of a worm screw having an annular recess in the periphery of said head, comprising a body having fingers gripping wings at one end thereof, an externally threaded shank at the other end of said body, a cylindrical socket in said shank, a tooth rigid with said body and extending centrally into the rear part of said socket, an internally threaded nozzle engaging said threaded shank and having a shoulder located in the rear of the forward end part of said nozzle, and a split expansible ring arranged coaxially in said nozzle and located between said shoulder and the forward end of said threaded shank, said ring being arranged in advance of the said tooth.



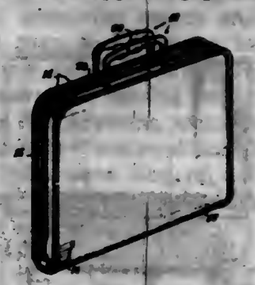
---

2,769,472
CITRUS JUICE EXTRACTOR HAVING PEEL SEPARATOR
Frank M. Alexander and Robert W. Bruns, Winter Haven, Fla., assignors to Brown Citrus Machinery Corporation, Whittier, Calif., a corporation of California
Application June 5, 1953, Serial No. 359,785
7 Claims. (Cl. 146—3)

1. In a citrus juice extracting machine of the type having a pair of extracting mechanisms for simultaneously extracting citrus juice and pulp from fruit halves, the combination with said mechanisms of a casing enclosing each of said mechanisms, each casing including a juice collecting pan and each pan having an opening in the lower portion thereof, walls forming a housing connecting the juice collecting pans and enclosing said openings, said housing having an opening in one of said walls, a pair of first separator grid members secured to said housing and extending downwardly from said openings, said grid members converging toward the center of said housing, a second separator grid member positioned below said pair of first grid members to receive peel and pulp falling therefrom, said second grid member being secured to another wall of said housing and extending downwardly and outwardly through the opening in the first-mentioned wall of said housing, and means for returning pulp particles from the lower end of said second grid member to the interior of said housing.

2,769,473
VEGETABLE PEELER HAVING A REVERSING SWITCH
William R. Comber, Erie, Pa., assignor to Champion Dish Washing Machine Company, Erie, Pa., a corporation of Pennsylvania
Application May 17, 1954, Serial No. 430,014
1 Claim. (Cl. 146—49)

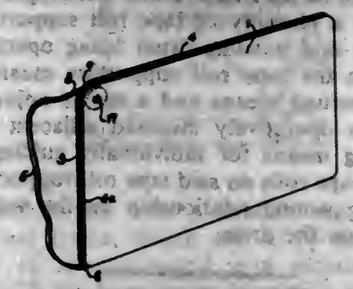
A vegetable peeler comprising a container, a rotatable disk in said container having an abradant upper surface, said rotatable disk having radially extending rounded elevations and valleys equally spaced around the surface of said disk connected by smooth curves at the merging points thereof defining continuous rounded curves, a reversible electric motor, means for transferring rotative force from said motor to said disk, a reversing switch having a neutral position connecting said motor to a power supply, said switch being adapted to be thrown from an off to a first position to operate said motor in one direction whereby said disk rotates in one direction and said rounded elevations wear on one edge, said switch being movable from said first position through an off position to a second position whereby said motor drives said disk in another direction whereby said elevations wear on another edge, said switch comprising a switch body having a movable contact, spaced first and second fixed contacts, means to connect a power supply to said movable contact, lever means associated with said movable contact to move said movable contact into engagement with said first fixed contacts, an axle carried by said movable contact, said lever means having an arcuate portion to move said axle out of a notch in said body, a slide member slidably supported on said switch and having a cam member thereon for guiding said axle into said notch in said switch body when said lever means moves said movable contact out of engagement with said first fixed contacts, a cam on said switch body on each side of said notch whereby said axle and said movable contact are caused to pause before moving into engagement with said second fixed contacts whereby said motor is allowed time to slow down before said switch is moved to said second position, said switch adapted to be moved from said off to said second position whereby said motor is reversed on alternate operations of said switch.



---

2,769,474
HANDLE ASSEMBLY FOR PORTABLE BAGS
Abraham I. Klotz, New Rochelle, N. Y.
Application December 16, 1954, Serial No. 475,634
4 Claims. (Cl. 190—12)

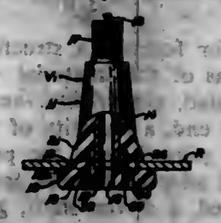
1. The combination with a portable bag of the type having panels connected together along their edges of an improved handle assembly comprising a separate handle retaining envelope swingingly secured inside the bag at the point of connection between the panels and having spaced handle receiving openings at its upper edge, said envelope having closed portions adjacent the inner ends of said handle openings and a handle member having a hand gripping portion with supporting portions adjacent the opposite ends of the gripping portion and extending downwardly through the handle openings in the envelope,



and retaining portions projecting angularly with respect to and secured to said supporting portions and disposed

inside the envelope beneath the aforesaid closed portions of the envelope.

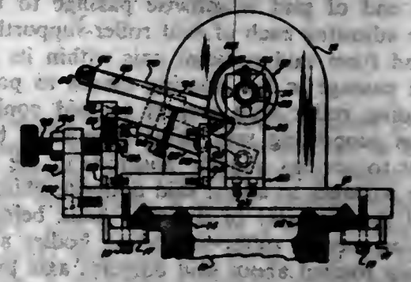
---



2,769,475
CARRYING CASE
Douglas A. Fisher, New York, N. Y.
Application February 8, 1954, Serial No. 408,846
3 Claims. (Cl. 150—33)

1. A carrying case including a casing, a carrying strap having one end connected to said casing, and a reel connected to said casing, the other end of said strap being connected to said reel and the latter being adapted to wind and unwind a portion of said strap, the first-named end of said strap and said reel being positioned at interspaced locations and said casing forming a substantially flat surface extending between said locations and against which said strap locates flatly when its said portion is wound on said reel so as to tauten the portion of said strap extending between said locations, said reel being located inside of said casing below the level of said surface and said casing having an opening formed therethrough and said strap extending through said opening.

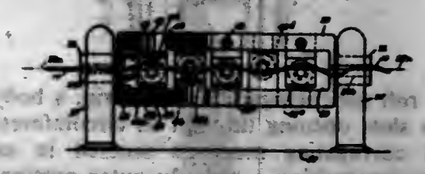
---



2,769,476
RUBBER TIRE VALVE ASSEMBLY
Frank Herzegh, Cleveland, Albert P. Wachter, Akron, and Walter J. Strong, Cuyahoga Falls, Ohio, assignors to The B. F. Goodrich Company, New York, N. Y., a corporation of New York
Application March 26, 1953, Serial No. 344,794
7 Claims. (Cl. 152—427)

7. A valve stem construction for a tubeless pneumatic tire rim comprising a rubber body portion adapted to project through and a distance radially outwardly of a rim valve hole and to fit against both sides of the edge thereof, a longitudinal air passageway through the stem, groove means in said body disposed circumferentially about and spaced radially from one end portion of said passageway and opening on the end of the body which projects radially outwardly of said rim valve hole, said groove means communicating with tire inflationary air when said rim and valve are in service with an inflated tubeless tire mounted on said rim, said groove means extending in depth axially of said body a distance beyond the portion thereof that fits against the sides of said valve hole.

---



2,769,477
BENDING APPARATUS
Kenneth R. Neer, San Diego, Calif., assignor to Solar Aircraft Company, San Diego, Calif., a corporation of California
Application April 17, 1952, Serial No. 282,861
7 Claims. (Cl. 153—54)

1. A mechanism for forming bendable material comprising a movable element having a deformable portion, a relatively stationary member having a rigid forming edge disposed in deforming pressure contact with said deformable portion, and means movably mounted on said member and movable with and to facilitate passage of a sheet of said bendable material between said element and said forming edge of said relatively stationary member to deform said material into an arcuate shape.

---

2,769,478
MACHINE FOR FORMING WIRE INTO A HELIX
Edward H. Schaus, Lakewood, Ohio, assignor to Famair Manufacturing Company, Cleveland, Ohio, a corporation of Ohio
Original application November 29, 1945, Serial No. 631,605, now Patent No. 2,588,663, dated March 11, 1952. Divided and this application August 10, 1951, Serial No. 241,298
1 Claim. (Cl. 153—66)

A forming machine for forming a wire into a helix of predetermined pitch and diameter comprising housing means having a lengthwise passage therethrough, means at the wire inlet end of the housing means defining a restricted inlet opening communicating with said lengthwise passage for the entry of the wire into said lengthwise passage, said lengthwise passage throughout its length being substantially larger in cross-section in all directions than said inlet opening, means defining an outlet opening at the opposite end of said housing means for passing the formed wire helix from said lengthwise passage, said lengthwise passage and said inlet opening having a conjoint axis, means supporting said housing means for free rotation about said conjoint axis, said housing means defining a plurality of transverse passages which intersect said lengthwise passage at axially spaced locations along said lengthwise passage, a corresponding plurality of roller-supporting bodies received individually in said transverse passages, a corresponding plurality of rotatable rollers individually supported in said lengthwise passage by said bodies and each having a peripheral

wire-engaging groove which encircles the axis of rotation of the roller, the width of the groove of each roller being substantially smaller than the width of said lengthwise passage in the housing means, each of said roller grooves presenting a wire-receiving peripheral portion which is offset transversely from said conjoint axis, with successive rollers along said lengthwise passage presenting said wire-receiving offset peripheral portions located respectively on opposite sides of said conjoint axis and with the respective axes of rotation of successive rollers along said lengthwise passage extending at opposite oblique angles to said conjoint axis to impart a helical twist to the wire as it engages said wire-receiving offset peripheral portions of the successive rollers in its travel from one end of said lengthwise passage to the other, means for adjusting each of said roller-supporting bodies toward and from said conjoint axis within its respective transverse passage in the housing means to position the corresponding roller with respect to said conjoint axis, and means supporting said roller-supporting bodies for adjustment to various angular positions in the respective transverse passages to adjust said opposite oblique angles to control the diameter of the wire helix being formed, said housing means, roller-supporting bodies and rollers being freely rotated about said conjoint axis by the feed of the wire being formed into said helix.

2,769,479

## ROLLS FOR CORRUGATING METAL STRIPS

Armstead G. Getz, Lakewood, Ohio, assignor to The Bishop and Babcock Manufacturing Company, Cleveland, Ohio, a corporation of Ohio

Original application March 23, 1951, Serial No. 217,228, now Patent No. 2,684,707, dated July 27, 1954. Divided and this application October 13, 1953, Serial No. 385,835

5 Claims. (Cl. 153—77)

1. In a roll for corrugating metal strip, a body having lengthwise slots opening through its circumferential surface, and corrugating members secured in said slots respectively comprising a radially outer portion providing a rib of undulatory formation lengthwise projecting radially outward beyond said roll body and radially inner positioning means substantially straight lengthwise of said rib and seating in the corresponding one of said slots.

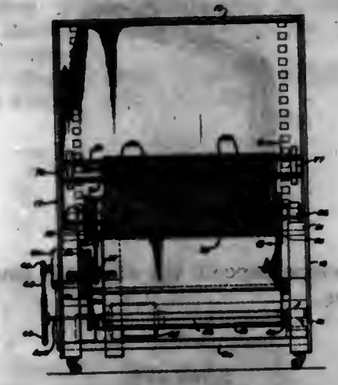
2,769,480



## METHOD AND APPARATUS FOR FORMING ASSEMBLIES OF CODED MARKERS ON PANELS

Norman Frank Diederich, Cleveland, Ohio

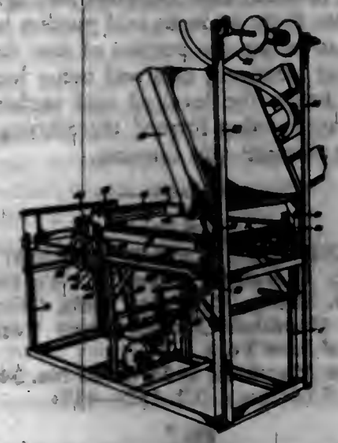
Application August 25, 1953, Serial No. 376,435

6 Claims. (Cl. 154—1.6)

1. The method of forming an article of manufacture comprising a panel of wire identifying tape consisting of arranging series of rolls of adhesive tape having non-adhesively coated surfaces of different appearances in pairs of common appearance, applying in a simultaneous and continuous manner the strips of tape to a supporting membrane in marginal abutment with the distinctive appearing surfaces thereof exposed and in pairs of common appearance and severing the assembled strips and membrane transversely of the direction of extension of the strip edges thereby to produce panels of pairs of strips, each pair being distinctive from all other pairs of assembled strips.

2. In an apparatus for winding adhesively coated tape upon a web of supporting material, the combination of a machine frame, a power driven winding drum rotatively supported on the frame, a web roll supporting means on the frame, a plurality of tape roll supporting means on the frame, said winding drum being operatively disposed between the tape roll supporting means and the web roll supporting means and a set of adjustable tape guiding means operatively disposed adjacent each tape roll supporting means for individually guiding tape extending from tape rolls on said tape roll supporting means to an abutting wound relationship on the web material being wound on the drum.

---



2,769,481

## MACHINE FOR FORMING STRUCTURAL MATERIAL

Doyle W. Meaner and Glenn G. Havens, San Diego, Calif., assignors to Narmco, Inc., San Diego, Calif., a corporation of California

Application October 2, 1952, Serial No. 312,830

18 Claims. (Cl. 154—1.8)

1. A machine for forming a structural material of a plurality of ribbons of thin material with alternate ribbons being undulated, comprising: an oven bed having an inlet and outlet end, a plurality of forming bars having a plurality of pins thereon for projecting into said structural material adapted to rest upon and be moved along said oven bed, a driven shaft, guide rails beneath said oven bed adapted to support forming bars, a forming bar engaging member, a parallelogram the upper side of which supports said forming bar engaging member beneath said guide rails, motion transmitting means transmitting rotary movement of said driven shaft into longitudinal oscillatory movement of the upper side of said parallelogram, thereby raising said forming bar engaging member into engagement with forming bars supported by said guide rails then advancing said forming bars along said guide rails, elevating means adjacent the inlet end of said oven bed receiving forming bars from said forming bar advancing means and raising same to the level of said oven bed, forming bar moving means driven by said drive means receiving forming bars from said elevating means and moving same across said oven bed, and forming bar lowering means withdrawing said pins from said structural material actuated by said drive means adjacent the output end of said oven receiving forming bars from said oven bed and lowering same to said forming bar advancing means.

2,769,482

## AUXILIARY SEATS FOR STROLLERS

Harry O. Carlson, Great Neck, N. Y.

Application March 16, 1953, Serial No. 342,383

4 Claims. (Cl. 155—10)

1. In combination with a stroller, the stroller comprising a base frame, wheels carried by the base frame, a plurality of interconnected strut members extending from and with the base frame forming a carriage frame and a handle for the stroller, substantially horizontal stay members carried by certain of the strut members, a main seat for the stroller carried by the stay members; of a pair of auxiliary seat frame members for association with the carriage frame, each auxiliary seat frame member comprising a pair of links, the links being pivotally connected to each other, an auxiliary seat carried by the links on each side of the carriage, one of these links anchoring it to a stay member, and the other of these links having means at its end for separably anchoring it to the base frame, the pivotal connection between the links providing means for accommodating the auxiliary seat positively to different distances between the stay members and the base frame.

---

2,769,483

## UNIVERSALLY ADJUSTABLE INVALID CHAIR

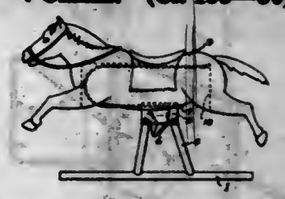
Marjorie A. Peterson, Fairfield, Calif.

Application April 25, 1953, Serial No. 503,529

14 Claims. (Cl. 155—28)

1. A universally adjustable chair comprising a back, a seat, and a leg drop, each formed of telescopic sections extendable longitudinally and laterally to conform to the width and height of a person to be seated therein, with said back and said leg drop hingedly connected to the respective back and front of the seat, and means for securing said back and leg drop in perpendicular or inclinably adjusted position relative to the said seat, at will; said means for securing comprising two telescopic struts for each side of the chair and connected at their respective ends to the back, and, to the seat and to the leg drop, and means for securing said struts in adjusted position.

---



2,769,484

## RESILIENTLY MOUNTED HOBBY HORSE

Howard G. Kalrath, Howard Beach, N. Y.

Application June 25, 1954, Serial No. 439,256

4 Claims. (Cl. 155—30)

4. In a seesaw, a pair of laterally spaced ground engaging runners, a pair of supports secured to and rising from the runners, said supports having upper end portions having outer sides, a saddle embracing said upper end portions, said saddle having a web portion and depending flanges engaging the outer sides of said upper end portions, a reclining U-shaped spring having upper and lower legs, said lower leg having a free end portion engaged between the web portion of the saddle and the upper end portions of the supports, means securing said free end portion in place, and a ridable body mounted on the upper leg of the spring, said supports each comprising an inverted U-shaped member having a bight portion and legs having lower ends, the lower ends of the legs being fixed to a related one of the runners, the bight portions of the U-shaped members constituting said upper end portions of the supports, said U-shaped members converging upwardly toward each other crosswise of the runners.

---

2,769,485

## BACK REST

Jacob Shapiro, Baltimore, Md.

Application August 28, 1951, Serial No. 243,981

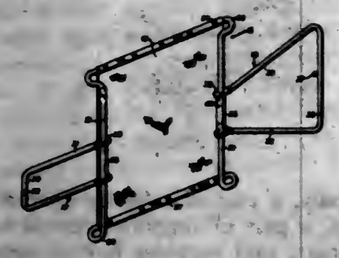
1 Claim. (Cl. 155—182)

A back rest comprising a base plate having a vertical portion and a horizontal portion, an elastic block superimposed on the horizontal portion of the base plate, an elastic cushion mounted on said block and secured to the vertical portion of the base plate, and a plate embedded in said cushion the margins of said plate being spaced from the margins of the cushion.

---

2,769,486

## BODY SUPPORTING DEVICE



Benjamin Rabinovitch, Bronx, and Albert Rothgart, Brooklyn, N. Y.; said Rabinovitch assignor to Henry L. Sobel, Hewlett, N. Y.

Application March 29, 1955, Serial No. 497,526

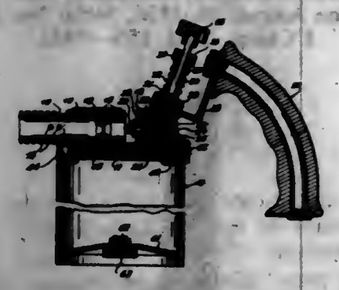
4 Claims. (Cl. 155—182)

1. A body supporting device comprising a generally polygonal open frame having one pair of opposed frame sides disposed in a plane spaced from the plane of the re-

maining frame sides, and a pervious flexible sheet extending tautly between an opposed pair of said remaining frame sides in the plane of the latter, whereby said frame is adapted to rest with said first named pair of frame sides against an appropriate surface and said sheet spaced from said surface to support the person of a user spaced from said surface, a first brace member having one end connected to one frame side of said first pair of frame sides for rotation thereabout toward and away from said sheet, and a second brace member of shorter length than

said first brace member and having one end connected to the other frame side of said first named pair for rotation thereabout toward and away from said sheet, and releasable interengaging means on the other ends of said first and second brace members for connecting the latter together in angular relation with respect to each other and said sheet, said device thus being adapted for selective disposition with one of said brace members adjacent to a supporting surface to maintain said sheet at a desired angle with respect to said supporting surface.

---



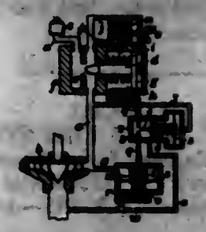
2,769,487

**BLOW TORCH**

Fritz L. Schweitzer, Aurora, Ohio

Continuation of application Serial No. 143,066, February 8, 1950. This application January 5, 1953, Serial No. 329,490

5 Claims. (Cl. 158—33)



5. A self-generating blow torch comprising in combination a hollow tank for the direct reception of liquid volatile inflammable fuel, said tank having a wall of highly heat conductive material, a burner nozzle disposed longitudinally along said wall in intimate heat exchange contact therewith whereby heat from said nozzle may be conducted to the interior of said tank to volatilize said fuel, a fuel passageway communicating with the interior of said tank and leading to said nozzle, said passageway including a highly elongated restricted tortuous chamber positioned in intimate heat exchange relation with said nozzle, and valve means in said passageway for controlling the flow of fuel to said nozzle, said heat conductive wall having a portion of substantial thickness immediately adjacent said nozzle and in intimate heat exchange relation therewith, said chamber being contained wholly within said thickened portion and comprising an elongated bore therein disposed generally parallel to said nozzle and means in said bore forming in cooperation with the walls thereof an elongated restricted spiral passage.

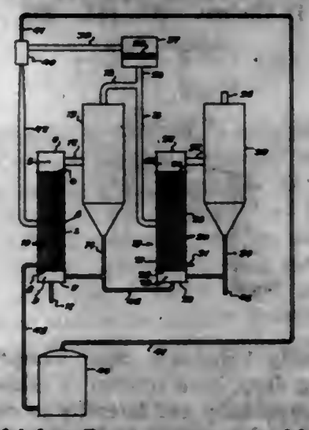
2,769,488

**LIQUID FUEL CONTROL MEANS**

Thomas Alfred Harris, Edgbaston, Birmingham, Owen Napier Lawrence, Dorridge, and Eugene Harold Warne, Otton, Birmingham, England, assignors to Joseph Lucas (Industries) Limited, Birmingham, England

Application July 22, 1952, Serial No. 300,176
Claims priority, application Great Britain July 31, 1951
4 Claims. (Cl. 158—36.4)

1. A liquid fuel supply system comprising in combination a centrifugal pump having an inlet and an outlet for liquid fuel, a fuel delivery pipe communicating with said outlet, a spring-loaded throttle arranged to provide a variable fuel-flow restriction in said pipe, a liquid-operated device connected to said throttle for effecting actuation thereof, and thereby varying fuel flow through said pipe, a first passage forming means connecting said pipe at the upstream side of said throttle to said device so that the latter tends to move said throttle against its spring loading towards a closed position in response to the delivery pressure of said pump, a second passage forming means connected to said device so that pressure liquid admitted to said device through said second passage forming means opposes the effect of the pump delivery pressure on said device, a valve arranged in association with said second passage forming means to control the pressure of the liquid admitted to said device through said second passage forming means, a governor responsive to the speed of said pump also arranged in association with said second passage forming means to control the pressure of the last mentioned liquid after said valve has assumed a predetermined position, and means responsive to the delivery pressure of said pump for moving said valve to said predetermined position before said governor becomes effective.



---

2,769,489

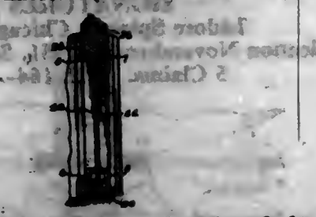
**MULTIPLE EFFECT EVAPORATOR**

Albert W. Eckstrom, Buffalo, N. Y., assignor to Blaw-Knox Company, Pittsburgh, Pa., a corporation of Delaware

Application September 16, 1954, Serial No. 456,030
3 Claims. (Cl. 159—24)

1. In a multiple effect evaporator with a first and a second effect each having a steam chest with heat transfer surfaces also forming a wall of the liquid space for the liquid to be concentrated, a condensate outlet line from each said steam chest, means for separating entrained

liquid from the vapor generated from said liquid by the heat from said first effect steam chest, and a vapor outlet from said separating means, the combination therewith of means for supplying high pressure steam to said first effect steam chest, comprising a boiler supplied with condensate from said condensate outlet line of said first effect, a pair of branches in said vapor outlet of said first effect, means connecting one of said branches to discharge vapor into the steam chest of said second effect, an enlarged separating chamber into which the other of said branches discharges vapor, a pad of closely intertwined thin elongated flexible pieces across said separating chamber and arranged to catch the mist-like droplets carried into said separating chamber by said vapor, said separating chamber having an outlet on the side of said pad remote from said other of said branches, a steam jet compresser having a vapor inlet, a steam pressure inlet and an outlet for the vapor compressed by steam from said steam pressure inlet, a conduit connecting said outlet for said separating chamber with said vapor inlet to said compresser, a steam line connecting said boiler with said steam pressure inlet of said compresser, and a conduit connecting said compressed vapor outlet of said steam jet compresser with said steam chest of said first effect, and means arranged to conduct said liquid from said first effect to said liquid space of said second effect.



---

2,769,490

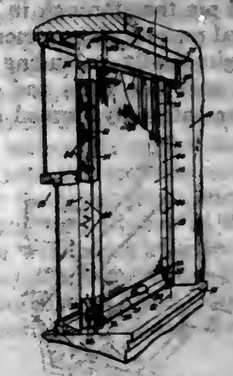
**ADJUSTABLE WINDOW SCREEN**

Salomon Kaziel Mahleoff, Montreal, Quebec, Canada, assignor of twenty-five percent to Frank C. Tanzer, Ste. Agathe des Monts, Quebec, Canada

Application January 7, 1952, Serial No. 265,263
15 Claims. (Cl. 160—21)

1. A screen construction for sash type windows, comprising a pair of upper frame members arranged in opposed side by side relation and united along their adjacent side edges for sliding endwise adjustment relative to one another, a pair of screen housing members arranged in opposed side by side relation and united along their adjacent side edges for sliding endwise adjustment relative to one another in cooptration with the corresponding upper frame members, a screening strip secured at one end to one of said upper frame members and at its other end to the corresponding housing member and a second screening strip normally disposed in overlapping relation with said first strip and secured at one end to the remaining upper frame member and at its other end to the remaining corresponding housing member, and roller means mounted in said housings for separately reeling and unreeling said screening strips to facilitate adjustment as to height of said screening strips.

---



2,769,491

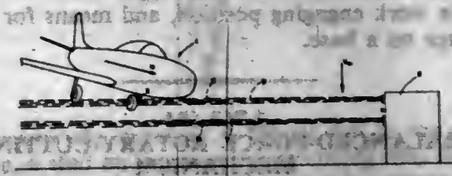
**RETRACTABLE WINDOW ENCLOSURE**

Robert Pitcoff, New York, N. Y., assignor to Epoch Products Corporation, New York, N. Y., a corporation of New York

Application June 17, 1952, Serial No. 293,926
11 Claims. (Cl. 160—23)

1. A latching mechanism for a retractable window screen comprising, in combination, an elongated latch bar for a spring roller screen, a plurality of tabs pivotally attached to said latch bar in spaced relationship to one another, means for pivotally attaching each of said tabs to the side of a window casing at a point removed from its point of attachment to said latch bar, said latch bar counterweighing said tabs, and means at the bottom of said latch bar for releasably engaging the free lower end

of the extended upwardly-urged screen whereby said latch bar is lifted and automatically swings said tabs into pinching engagement with the longitudinal edge of said screen.



---

2,769,492

**VELOCITY METER**

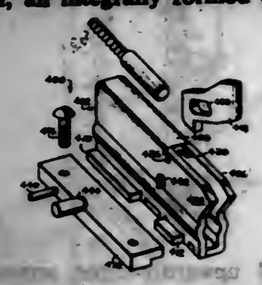
Ralph H. Ostergren, Fullerton, Sydney J. Goldberg, Los Angeles, and Robert R. Horstall, Jr., and John M. Wuerth, Whittier, Calif., assignors to North American Aviation, Inc.

Application July 21, 1952, Serial No. 299,982
14 Claims. (Cl. 161—18)

1. Means for measuring a velocity component of a moving object, comprising a retroflective element upon said object; a first and second optical system spaced apart a predetermined distance, each said optical system having a field of view which has negligible thickness in the direction of said velocity component and extending transversely to said component; a stationary light source; a light-projecting system adapted to project light along the optical axes of said first and second optical systems; photosensitive devices associated with each said optical system respectively; a timer; and electrical means connected between said timer and said photosensitive devices for starting and stopping said timer whereby light projected from said light-projecting system is intercepted by said retroflective element and is reflected into said first and second optical systems energizing said first and second photosensitive devices consecutively whereby said timer is started by the signal from said first photosensitive device and stopped by the signal from said second photosensitive device, the measured component of velocity of said object being reciprocally related to the time registered by said timer.

---

2,769,493

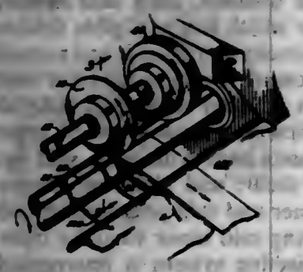


**STOP MECHANISM FOR PUNCH PRESSES**

Willard A. Kaysse, Flint, Mich.

Application April 7, 1955, Serial No. 500,009
3 Claims. (Cl. 164—69)

1. A material stop mechanism comprising a gage having a housing formed of a single sheet of material, said housing comprising a pair of oppositely disposed spaced and substantially parallel side walls having an integrally formed bight connecting the upper ends of said side walls and extending from one end thereof to a centrally disposed point, a pin extending between and supported on said side walls forwardly of and proximate to the terminal



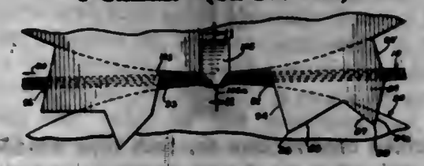
inner end of said bight, a second pin extending between and supported on said side walls below said first pin, a polygonal plate having an elongated slot formed therein, said plate being disposed between said side walls and receiving said second pin therethrough in said slot for pivotal and longitudinal reciprocal movement relative to said side walls, a longitudinally extending arcuate groove formed in each of said side walls and disposed in confronting relation, an integrally formed end wall extend-

ing from one of said side walls across said one end thereof, a cylindrical member having a closed end disposed in said grooves for reciprocation therein, a resilient member having an end thereof engaging against said end wall and said closed end of said cylindrical member, said closed end of said cylindrical member constantly engaging against a side of said plate to urge said plate for longitudinal and pivotal movement, said second pin being disposed in the path of movement of said plate to engage and thus limit its movement in one direction, said plate having an end thereof normally extending above the upper ends of said side walls in work engaging position, and means for securing said gage on a base.

---

2,769,494
**BALANCED-FORCE ROTARY-CUTTING MECHANISM**
William A. Spurrier and Russell K. Regier, Los Angeles, Calif.
Application June 24, 1954, Serial No. 438,908
4 Claims. (Cl. 164—61)

1. In a rotary cutting mechanism for trimming paper or other similar material, wherein a double-edged rotatable cutting device is operated cooperatively with a rotatable cutting roller, said roller including a cutting groove having two edges cooperatively associated with the edges of said rotary cutting device, the material to be trimmed being passed through the rotatable cutting device to a receiving surface; a device for removing scrap material from said cutting groove, said device comprising: a spring wire including first and second portions having opposite curvatures, said first portion being of substantially the same circular curvature as the inner edge of said cutting groove, including an opening allowing the entry of said cutting groove therein, and having a spring constant such that the insertion of said first portion around said cutting groove causes a frictional engagement therewith; and said second portion being arranged to engage said surface whereby the insertion of said first portion around said cutting groove, and the rotation of said roller causes said spring wire to engage said surface and to provide a scrap removable path for said material.



2,769,495
**WEB CUTTING AND SHEET DELIVERY AND STACKING MECHANISM**
Anthony W. Fenner, Piscataway Township, Middlesex County, and Charles J. Waechter, New Brunswick, N. J., assignors to John Waldron Corporation, New Brunswick, N. J., a corporation of New Jersey
Application July 1, 1953, Serial No. 365,376
6 Claims. (Cl. 164—68)

1. In mechanism of the type described, in combination, a ledger plate, a rotatable cylinder having a knife blade projecting therefrom to cooperate with said ledger plate when substantially midway between the horizontal and bottom positions, means to deliver a web horizontally over said ledger plate, pull rolls spaced from the ledger plate a distance less than the length of a cut sheet, an imperforate metal plate fixed and extending from the edge of the ledger plate to a position just in advance of the nip of said rolls, said metal plate being curved to parallel the knife movement from the ledger plate to a position directly below the cylinder axis and horizontal from there to the said position adjacent said nip.

---

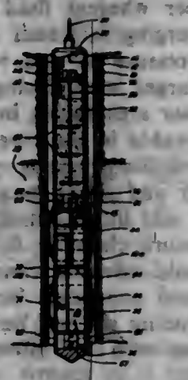
2,769,496
**ROTARY CUTTING DIE FOR PERFORATING SIGNATURES**
Isidore Spinner, Chicago, Ill.
Application November 23, 1951, Serial No. 257,700
5 Claims. (Cl. 164—99)

1. A rotary cutting die for forming a linear series of perforations in a stack of sheets of paper that are to constitute a signature, said die having a series of radially projecting punching teeth extending outwardly from the periphery thereof, the overall radial extent of each tooth being of sufficient length to project well beyond the signature and to eject the severed chips of the various paper layers from the formed perforation, and said die having sheet perforating projections between certain teeth, each having a substantially smaller corresponding transverse cross-sectional dimension and radial extent relative to said teeth, the teeth and the projections being in a common plane which passes through the centers of the teeth and the centers of the projections so that said projections produce cuts in the sheet substantially smaller than the blanks cut by the teeth and centered along the central plane of said teeth.

---

2,769,497
**METHOD FOR TREATING HYDROCARBON PRODUCING FORMATIONS**
Carl E. Reistle, Jr., Houston, Tex., assignor, by mesne assignments, to Esso Research and Engineering Company, Elizabeth, N. J., a corporation of Delaware
Application January 6, 1953, Serial No. 330,269
4 Claims. (Cl. 166—42)

1. A method for selectively increasing the permeability of a plurality of hydrocarbon productive intervals penetrated by a well bore having a tubing arranged therein

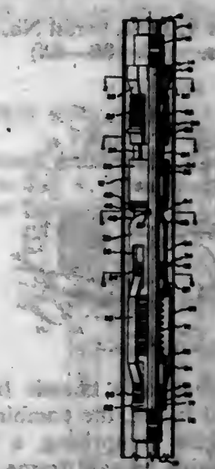


which comprises perforating a first hydrocarbon productive interval, sealing off the annulus between said tubing and said well bore below said productive interval, imposing fluid pressure on said perforated first interval sufficient to fracture said first interval perforating a second

hydrocarbon productive interval, sealing off the annulus between said tubing and said well bore below said second productive interval and then imposing fluid pressure on said second perforated interval sufficient to fracture said second interval.

---

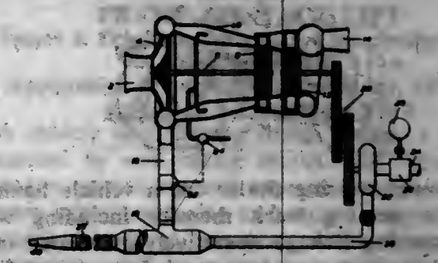
2,769,498
**APPARATUS FOR SQUEEZE CEMENTING WELL PERFORATIONS**
Theodore A. Huber, Houston, Tex., assignor, by mesne assignments, to Esso Research and Engineering Company, Elizabeth, N. J., a corporation of Delaware
Application July 26, 1954, Serial No. 445,556
9 Claims. (Cl. 166—48)



1. Apparatus for sealing off a selected interval in a perforated casing which comprises a body member adapted to be lowered on a wireline in the casing provided with a first chamber containing a releasable slurry of fluid cementitious material and a second chamber containing a releasable body of fluid, spaced apart packing members arranged on said body to isolate when inflated at least one selected perforation in said perforated casing, means fluidly communicating said first chamber with the outer surface of said body member between said spaced apart packing members, means fluidly communicating said second chamber with the interior of said packing members, and separate means for introducing said fluid cement between said packing members and introducing said fluid into said packing members to inflate said packing members and isolate a selected interval in said perforated casing.

---

2,769,499
**TUBING ANCHOR**
William H. McKissick and Jessee E. Pate, Jr., Tulsa, Okla.
Application April 30, 1951, Serial No. 223,759
7 Claims. (Cl. 166—209)



A tubing anchor for anchoring a string of tubing in the casing of an oil well, comprising a tubular mandrel interposed in the string of tubing, an actuating sleeve loosely disposed on the mandrel and having slots therein, a lower sleeve member on the lower end of the mandrel, stop means on the mandrel limiting downward movement of the lower sleeve, a plurality of friction springs disposed around the mandrel and radially spaced therefrom in engagement with the well casing, said friction springs having one end thereof slidably disposed in the slots of the actuating sleeve in a manner to provide limited longitudinal movement of the sleeve relative to the friction springs, and the opposite end of each friction spring secured to the lower sleeve member, whereby the friction springs preclude rotation of the actuating sleeve with respect to the well casing when the mandrel is rotated relative to the actuating sleeve, a helical spring around the mandrel anchored at its lower end to said lower sleeve member and continually urging the actuating sleeve

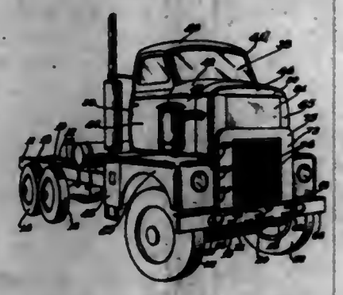
upwardly over the mandrel, a helical slot in the actuating sleeve, a stud on the mandrel extending into the helical slot and operable to move the actuating sleeve downwardly upon rotation of the mandrel in one direction against the action of the helical spring and adapted to release the actuating sleeve for upward actuation by the helical spring upon rotation of the mandrel in an opposite direction, a retaining ring loosely disposed on the mandrel above the actuating sleeve and adapted to be moved upward by the actuating sleeve upon upward actuation thereof by the helical spring, and a plurality of slips carried by the retaining ring adapted to engage the well casing upon upward movement of the retaining ring and adapted to become disengaged from the well casing when the retaining ring is released by the actuating sleeve upon downward movement of said actuating sleeve by said stud as the mandrel is rotated.

---

2,769,500
**FOAM-PRODUCING APPARATUS**
Wilfred James Clifford, Brentford, England, assignor, by mesne assignments, to The Fyr-Fyter Company, Dayton, Ohio, a corporation of Ohio
Application July 9, 1952, Serial No. 297,846
Claims priority, application Great Britain July 11, 1951
6 Claims. (Cl. 169—15)

1. A self-contained apparatus for producing foam comprising an internal-combustion gas-turbine engine

including an air compressor, connections for delivering air from said compressor to a combustion chamber of said engine, means defining a foam-mixing space, means for conducting air from the high pressure side of said compressor to said foam-mixing space, a pump driven by said engine, means for storing a limited amount of liquid under low head, connections from said pump to said liquid storing means whereby said liquid is withdrawn by said pump from said storing means, and means for conducting liquid under relatively high pressure from the discharge side of said pump to said foam-mixing space.



---

2,769,501

## BUMPER, RADIATOR, AND GRILLE ASSEMBLY FOR SECTIONAL VEHICLE CAB

John C. Wagner, Berkeley, Calif., assignor to International Harvester Company, a corporation of New Jersey

Application October 9, 1952, Serial No. 313,832
7 Claims. (Cl. 180—68)

6. In a motor truck having a chassis frame and an engine supported by said frame, the combination including said frame and engine comprising, a vehicle body supported above said engine by said frame and partially defining an enclosure for said engine, said body having a forwardly facing, inverted U-shaped opening in one end thereof; a movable door for closing a portion of said opening; a sub-assembly including radiator means for said engine and a bumper supporting said radiator means; and means for attaching said sub-assembly to said frame whereby said radiator means partially extends within said opening formed in said body and partially defines a wall of said engine enclosure, said means for attaching said sub-assembly to said frame affording quick detachment of said sub-assembly to gain access to one end portion of said engine and including a plurality of elements having portions thereof disposed forwardly and on the exteriorly facing side of said bumper, said door when in its closed position and said radiator means extends into said opening being adapted to close said opening.

---

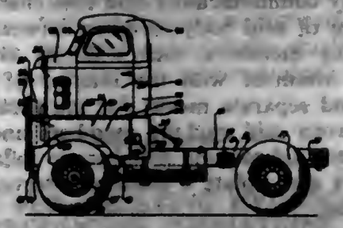
2,769,502

## HYDRAULIC POWER STEERING MECHANISM FOR VEHICLES

Joseph F. Zinkal, Brookfield, Ill., assignor to International Harvester Company, a corporation of New Jersey

Application December 10, 1953, Serial No. 397,427
11 Claims. (Cl. 180—79.2)

1. In a power steering device for a vehicle having a frame and a steering truck therefor including wheel means and steering linkage operatively associated therewith, manual steering apparatus carried upon said frame and including an output shaft rotatable pursuant to manipulation of said steering apparatus, a lever pivoted upon said shaft and having an operative connection to said linkage, an hydraulic motor reactively connected between said frame and said lever, said motor comprising a cylinder, a ram having a rod extending from one end of said cylinder and having a piston slidably mounted within said cylinder and dividing the same into advance and return chambers, valve means carried upon the opposite end of said cylinder and comprising a body with a longitudinal bore therein substantially coaxial with said cylinder, said body pivoted to said lever at an end remote from said cylinder, a valve spool within said bore and having a land in fluid tight engagement with said bore, guide collars at opposite sides of said land on said spool and spaced axially thereof and defining intake and outlet chambers with said land, respectively, a fluid reservoir, a pump having a suction side connected to said reservoir and a discharge side connected to said intake chamber, said outlet chamber connected to said reservoir, a by-pass passage in said valve body communicating with said intake and outlet chambers in the neutral position of said spool whereat said land is axially centered with respect to said passage, conduit means affording communication between said intake and return chambers, conduit means communicating with said advance chamber, a utilization port in said valve body connected to said last mentioned conduit means and communicating with said bore through a port chamber therein centered with respect to said land in said neutral position whereat said port chamber communicates with said intake and outlet chambers, said spool movable longitudinally of said bore in one direction from the neutral to close said by-pass passage and said port chamber to said outlet chamber and to simultaneously open said utilization port to communication with said intake chamber whereat fluid is ported into said advance chamber urging said ram to extended position against the back-pressure in said return chamber, said piston having a larger area facing into said advance chamber and a lesser area facing into said return chamber, said spool movable in the reverse direction to said first mentioned direction whereby opening said port to said outlet chamber and simultaneously closing said by-pass passage from said intake chamber whereby fluid is ported into said return chamber for retracting the ram while exhausting said advance chamber, and operating means for said spool connected between the same and said shaft and including shifting linkage for moving the spool in accordance with the movement of said shaft.



---

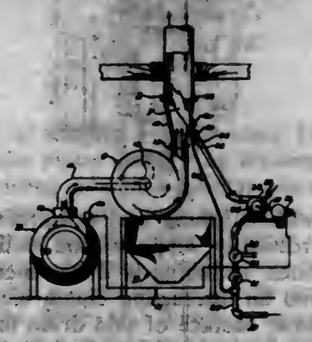
2,769,503

## PIVOTALLY MOUNTED FENDER FOR CAB-OVER-ENGINE VEHICLES

John C. Wagner, Berkeley, Calif., assignor to International Harvester Company, a corporation of New Jersey

Application October 9, 1952, Serial No. 313,831
6 Claims. (Cl. 180—89)

5. In a cab-over-engine type motor truck having an engine, an enclosure for said engine, and a vehicle cab having a doorway formed in the wall thereof for entering and leaving the vehicle cab, the lower marginal edge of said doorway being defined by a door sill, the combination including, a vehicle fender forming a side wall portion of said engine enclosure and comprising a stationary section and a movable section normally positioned in alignment with said stationary section, said movable section being pivotally supported by said motor truck for horizontal swinging movement with respect to said stationary section about a vertical axis spaced forwardly of said stationary section whereby outward horizontal swinging of said movable section with respect to said stationary section permits direct access to said engine; and lock means for maintaining said movable section in the normal, aligned position including a vehicle cab door pivotally mounted adjacent said doorway swingable between open and closed positions about an axis spaced from and substantially parallel to the pivotal axis of said movable fender section, the lower marginal edge of said door overlying and being transversely spaced from said door sill when said door is in its closed position, said movable fender section having a member fixed to and extending vertically from said movable fender section adjacent the free end thereof and disposed adjacent said door sill when said movable fender section is in its normal position, said member having a shoulder formed thereon adapted to be confined between the lower edge of said door and said door sill when said door is in its closed position and said movable fender section is in its normal position to prevent outward swinging of said movable section.



---

2,769,504

## METHOD AND APPARATUS FOR TREATING COFFEE ROASTER EXHAUST GAS

Earl M. Miller, Euclid, Ohio, assignor, by mesne assignments, to Cook Coffee Company, a corporation of Ohio

Application December 31, 1952, Serial No. 329,069
8 Claims. (Cl. 183—6)

2. A method for removal of combustible constituents from the exhaust gas stream of a coffee roaster oven comprising the steps of centrifugally separating entrained solid particles from the exhaust gas stream, thereafter burning combustibles in the gas stream by subjecting the exhaust gas stream while in flow through a discharge conduit to the action of flame injected into the conduit and controlling the flame action in relation to the prevailing temperature of the oven thereby to increase the burner flame upon increased content of combustibles in the exhaust stream attending increased oven temperature.

---

2,769,505

## ELECTRICAL PRECIPITATION APPARATUS FOR PROTECTIVE RESPIRATORS

Friedrich Julius Maas, Zurich, Switzerland, assignor to Société Financière d'Expansion Commerciale et Industrielle S. A. "Sinter," Sarnen, Switzerland, a company of Switzerland

Application March 29, 1952, Serial No. 281,404
Claims priority, application Switzerland April 26, 1951
16 Claims. (Cl. 183—7)

1. Electrical precipitation apparatus for protective respirators having a radioactive ionizer and electrostatic separator for particles contained in an air stream, the apparatus comprising means forming an ionizer chamber, said chamber having at least one axially extending inner wall portion, a coating of radioactive material arranged on said wall portion and emitting ionizing rays consisting of predominantly alpha and beta radiation and only a negligibly small amount of gamma radiation, electrode means creating in the region of said ionizing rays an electrical field in said chamber with its flux lines directed predominantly transversally to the direction of the air stream in said chamber, said electrode means being positioned down-stream of the ionizer chamber and a cylindrical electrode supporting member forming with the electrode means an exchangeable filter cartridge.

2,769,506

## APPARATUS FOR SEPARATING AEROSOLS FROM GASES

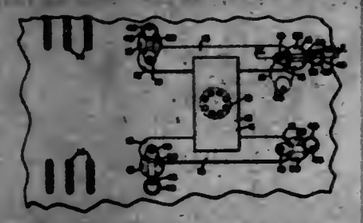
Harry I. Abbood, Ville Platte, La., assignor of one-half to Joe A. Izen, Houston, Tex.

Application January 18, 1952, Serial No. 267,065
4 Claims. (Cl. 183—58)

1. In a device for separating aerosols from gases, the combination of a casing structure having a first compartment and a second compartment, a porous filter bag positioned in said second compartment, a support member secured to the casing structure for dividing same into said first compartment and said second compartment and for supporting said filter bag within said second compartment, said bag having an open top, means for passing the gases through the compartments in a direction so they will pass from externally of the bag through the bag and out of the top of the bag opening whereby the aerosols will collect externally upon the bag, and a sound generator positioned in said first compartment for directing the waves therefrom in a direction towards and into the interior of said filter bag to subject the aerosols on the external surface of the bag to the action of the waves to cause the aerosols to drop by gravity from the external surface of the bag without causing appreciable visible vibration of the bag.

---

2,769,507

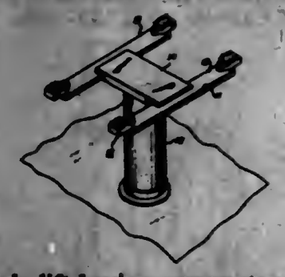


## FRAME CONTACT LIFT

James J. Pelouch, Cleveland, Ohio, assignor to Farm Tools, Inc.

Application July 10, 1953, Serial No. 367,199
6 Claims. (Cl. 187—8.75)

1. A vehicle hoist having lifting means, a superstructure carried by said lifting means, and variable extension means carried by said superstructure and including a primary vehicle engaging and supporting pad connected on a vertical axis at one end portion thereof to said superstructure, and a secondary vehicle engaging and supporting structure connected on a pivot shaft to said

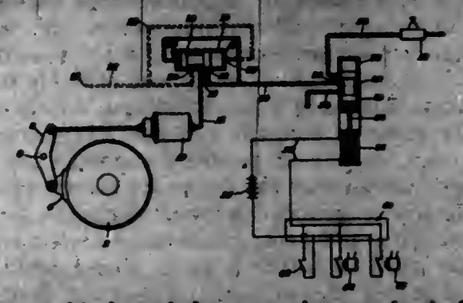


primary pad at another end portion thereof and having a horizontal vehicle engaging and supporting pad mounted at one end on said pivot shaft and extendable beyond said primary vehicle engaging and supporting pad,

and means including said pivot shaft for varying the vertical distance between said primary and secondary vehicle engaging and supporting structures, and for adjustably securing the second pad in different angular positions.

---

2,769,508
FRAME CONTACT LIFT
James J. Pulcrano, Cleveland, Ohio, assignor to Forn Tools, Inc., a corporation of Ohio
Application May 29, 1952, Serial No. 290,829
4 Claims. (Cl. 187—8.75)



1. In a vehicle lift having a superstructure, said superstructure including a body member, said body member having a socket provided with a top wall and a support member spaced from said top wall, a vehicle support including an arm with a supporting pad on a first end thereof, a shoulder element and a hook element, means mounting one of said elements facing downwardly from said top wall, means mounting the other of said elements projecting upwardly on the second end of said arm, said arm extending into said socket and residing within said socket with an intermediate portion engaging said support member and said arm and top wall elements interengaging, said support member constituting a fulcrum for said vehicle support whereby a downward force on said supporting pad is resisted by the arm element engaging said top wall element, and surfaces in said socket defining sufficient space vertically below said top wall element to accommodate the maximum vertical dimension of said arm element whereby removal of said vehicle support is effected by lowering said arm element away from said top wall element and pulling said arm from said socket.

---

2,769,509
ANTI WHEEL SLIP DEVICE
Raymond Wehr, Chicago, Ill., assignor to American Steel Foundries, Chicago, Ill., a corporation of New Jersey
Application October 30, 1953, Serial No. 389,193
6 Claims. (Cl. 188—1)

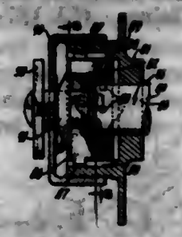
1. In a railway braking arrangement having means for increasing adhesion between a wheel tread and a rail, a wheel having a tread engageable with the rail, a brake lever having a shoe thereon engageable with the tread of said wheel, a fluid actuated brake cylinder operatively connected to the lever, a conduit carrying actuating fluid to the cylinder, and means in said conduit to control the pressure of said actuating fluid, said means comprising a two way pressure actuated valve connected to said conduit, a pressure actuated piston in the valve, a relatively high pressure line communicating with said valve and with one side of said piston, a relatively low pressure line communicating with the valve and with the other side of

said piston, said piston being operative to selectively connect one of said lines with said conduit, a solenoid controlled valve in said low pressure line operative to control the flow of pressure fluid therein, and electrical means to control the action of said solenoid controlled valve.

---

2,769,510
OVERRUNNING CLUTCH AND ONE WAY BRAKE WITH DISABLER FOR FISHING REEL
James H. Hayes, Yonkers, N. Y.
Original application May 1, 1946, Serial No. 666,396, now Patent No. 2,694,273, dated July 22, 1952. Divided and this application April 23, 1952, Serial No. 283,959
8 Claims. (Cl. 188—82.3)

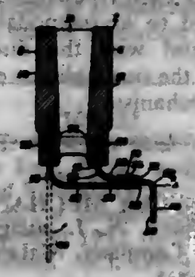
1. For use with a fishing reel comprising a housing, a spool shaft rotatably supported on said housing, an overrunning clutch including a drum member secured to said shaft and an interacting clutch element engageable with the inner surface of said drum member, a rod mounted in said housing, a first braking element rigid with said rod and with said clutch element, a second braking element supported by said housing for movement toward and away from said first braking element and nonrotatable in respect thereto, a plate longitudinally movable on said rod and nonrotatable in respect to said second braking element, springs interposed between said plate and said housing normally urging said second braking element away from said first braking element, a spring member interposed between said plate and a wall of said housing to move said second braking element into engagement with said first braking element against the action of said first mentioned springs.



---

2,769,511
ONE WAY BRAKE
James H. Hayes, Yonkers, N. Y.
Original application May 1, 1946, Serial No. 666,396, now Patent No. 2,694,273, dated July 22, 1952. Divided and this application April 23, 1952, Serial No. 283,960
2 Claims. (Cl. 188—82.9)

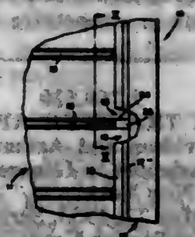
1. A one way brake comprising a housing having a cup-shaped body portion and a cup-shaped head in screw threaded adjustable engagement with said body portion, a spool shaft rotatably mounted in said body portion, a rod mounted in said head in coaxial relation to said shaft, a first braking element mounted on said shaft,



rotatable therewith and movable longitudinally thereon, a second braking element on said rod, movable longitudinally thereon and nonrotatable with respect thereto, a spring interposed between said second braking element

and said adjustable head whereby said second braking element will be maintained resiliently in contact with said first braking element and means for moving said first braking element into contact with said second braking element when said shaft rotates in one direction.

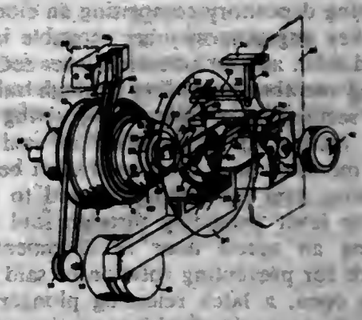
---



2,769,512
BRAKE ROTOR
Carl E. Tack, Chicago, Ill., assignor to American Steel Foundries, Chicago, Ill., a corporation of New Jersey
Application November 2, 1951, Serial No. 254,601
1 Claim. (Cl. 188—218)

A method of making a brake rotor having a pair of annular friction plates comprising forming a sheet metal support consisting of a flat annular plate having a plurality of notches in its inner perimeter defining spaced spokes projecting radially inwardly from the inner perimeter of the plate, forming another support consisting of a cylinder with a radially outwardly projecting flange, positioning the plate and flange in spaced relationship to each other in a mold, casting said friction plates respectively integral with the plate and the flange and spaced from the spokes and cylinder, removing the rotor from the mold, bending the spokes into radially overlapping relationship with the inner perimeter of the cylinder and securing said spokes to said cylinder internally thereof.

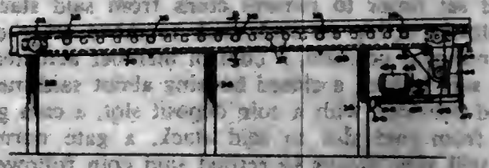
---



2,769,513
EDGE STRUCTURE FOR A CLOSURE DEVICE
Wesley A. Smith, Ferndale, Mich., assignor to The-A-Door Corporation, Detroit, Mich., a corporation of Michigan
Application August 8, 1955, Serial No. 526,940
5 Claims. (Cl. 189—46)

1. An edge structure for a closure device, comprising: a panel having a plurality of integral, offset channels arranged crosswise of one edge thereof, the ends of said channels adjacent to said one edge being aligned with, and spaced inwardly from, said one edge; an edge element having first and second, connected flanges, portions of said flanges near their free edges being urged toward each other and said one edge of said panel being disposed between said portions; a side plate integral along one edge with the free edge of said first flange, said plate extending away from the first flange on the opposite side from the second flange, and said ends of said channels being adjacent to said plate; and a clip having a substantially L-shaped portion, one part thereof being disposed between said first and second flanges, and another part thereof extending into an adjacent channel and substantially transverse thereof.

---



2,769,514
FREQUENCY SELECTOR DEVICE
Henry Clinton De Witt, New Providence, N. J., assignor to the United States of America as represented by the Secretary of the Army
Application May 3, 1951, Serial No. 224,380
4 Claims. (Cl. 192—.02)

1. A clutch assembly comprising a rotatably driven first member and a rotatable second member adapted to engage said first member, said first member comprising a cylindrical cup-shaped housing having a solid base, a diametral channel disposed within said base, a slideable cam follower member superimposed in said channel, means for maintaining said slideable member in sliding contact with the surface of said channel, an elongated pawl pivotally mounted on said base, linkage means connecting said pawl and one end of said slideable member whereby rectilinear movement of said slideable member affects angular movement of said pawl, a rectangular aperture in the other end of said slideable member, a cam disposed within said aperture and adapted to abut the edges thereof to actuate said slideable member, and a pivotally mounted centrifugally responsive lever arm superimposed on said slideable member and affixed to said cam for actuating said cam to disengage said clutch members when said first member is rotatably driven.

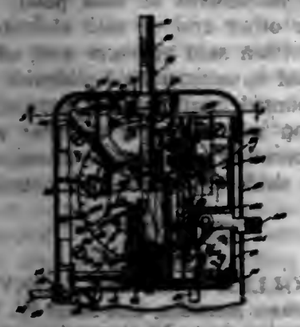
---

2,769,515
CONTROLLED GRAVITY CONVEYER
Theron H. Thomas, Arcadia, and John W. Huggins, Palo Alto, Calif., assignors to Mathews Conveyer Company, Ellwood City, Pa., a corporation of Pennsylvania
Application February 18, 1953, Serial No. 337,472
12 Claims. (Cl. 193—35)

1. In a controlled gravity conveyer having means for conveying articles by gravity in one direction, a control device comprising a rotatable element mounted on

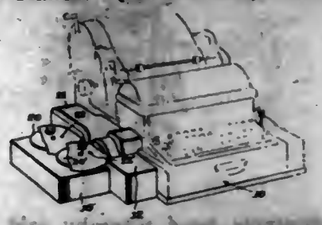
the conveyer and arranged to engage articles moving along said means, a driven element, and clutch means coupling said elements in a manner permitting relative rotation of said rotatable element with respect to said driven element thereof in a direction opposite to said one direction.

---



2,769,516
CLEANING DEPOSITORY
Robert K. Hensley, Jr., Silver Spring, Md.
Application January 16, 1953, Serial No. 331,564
9 Claims. (Cl. 194—4)

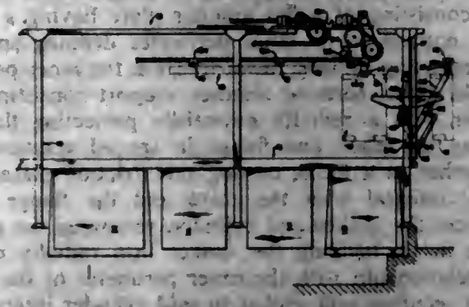
1. A cleaning depository comprising an elongated arcuate tube, a key engaging member movable in said tube, a slot in said tube, and an actuation lever secured to said key engaging member extending through said slot, said lever being secured to a rotatable receiving drum, said drum being rotated upon actuation of said lever, said drum being mounted on a shaft, said shaft being journalled in a casing, said tube being secured to said casing, said actuation lever extending through said casing, said casing having an access door in alignment with said drum, a latch for preventing rotation of said drum when said door is open, a latch releasing plunger secured to said door, a stop cam for limiting rotation of said drum without a key, said key engaging said stop cam upon movement of said actuation lever, said key engaging member moving said key in said tube against said stop cam to move the stop cam from operative position.



---

2,769,517
PERIODIC COIN COLLECTOR
William L. Hudson, Fort Wayne, Ind.
Application April 27, 1951, Serial No. 223,190
10 Claims. (Cl. 194—9)

1. A periodic coin collector, comprising a coin stack holder adapted to hold a plurality of coins flatwise in a stack, time-responsive mechanism operative at predetermined set times to remove coins from said stack, a coin follower acting on said stack to move other coins toward removal position, a control member actuated by coins in said holder, a closed housing about said mechanism and provided with a coin deposit slot, a cam guide leading from said slot to said stack, a gate normally closing said slot, means to retract said coin follower to permit addition of coins to replenish said stack, and means actuated with the retraction of said coin follower to move said gate to open position.

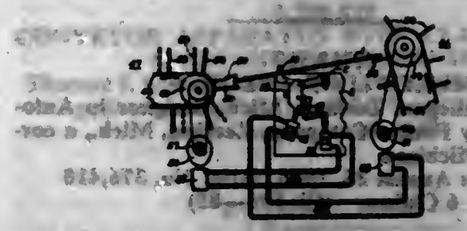


2,769,518
RECORD DISC FOR STORING INFORMATION AND SYSTEM USING SUCH RECORD
Charles E. Faulkner and Ralph R. Brewer, Chicago, Ill., assignors to Spiegel, Inc., a corporation of Delaware
Application June 22, 1954, Serial No. 438,439
6 Claims. (Cl. 197—20)

1. For use with a typewriter or similar machine having punching and reading stations with heads for normal cooperation with perforated tape, an attachment comprising two turntables in horizontal planes but at different levels, said punching and reading station heads also being at different levels and having slots at different levels for accommodating the record, said attachment being disposed so that the two turntables are substantially level with the slots in the two typewriter stations, and means coupling said turntables and said typewriter station mechanism for turning said two turntables through a predetermined angle for each typewriter actuation, each turntable being adapted to accommodate a disc record of perforatable material with the disc record extending beyond the edge of the turntable for entry into the slot of the station head mechanism.

---

2,769,519
TRANSFER MECHANISMS
Paul A. Hauck, Union, N. J., assignor to Hanson-Van Winkle-Munning Company, Matawan, N. J., a corporation of New Jersey
Application July 14, 1954, Serial No. 443,193
11 Claims. (Cl. 198—31)

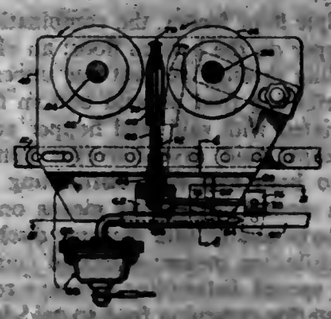


1. A mechanism for transferring article carriers between stations, which comprises spaced vertical columns, a track mounted for movement on each column and extending transverse thereto, a pair of arms each connected at its lower end with one of the columns for swinging and vertical movement and having a roller movable along the track on said column, means on the arms for supporting a carrier, means for rocking the arms, means for raising and lowering the tracks, and control means for causing the rocking means and the raising and lowering means to operate in a repetitive transfer cycle.

---

2,769,520
ARTICLE TRANSFER APPARATUS
Thomas R. N. Davidson and Arthur H. Scruton, Wembley, England, assignors to General Electric Company, a corporation of New York
Application May 22, 1953, Serial No. 356,794
Claims priority, application Great Britain June 5, 1952
3 Claims. (Cl. 198—26)

1. In combination, a first conveyor for receiving articles from a machine and a second conveyor for delivering the articles to another machine and having relative rates of operation such that the second conveyor is ready to receive articles at a rate which is greater than the maximum delivery rate of the articles from the first conveyor, and a transfer apparatus comprising a delivery channel for said articles interconnecting said conveyors, stopping means in said channel normally arresting the passage of said articles at a predetermined point, a first actuating means operable intermittantly in direct synchronism with the first conveyor to normally positively



withdraw said stopping means and release said articles at predetermined time intervals, locking means normally positioned to block withdrawal of said stopping means, and a second actuating means operable intermittently and independently of said first actuating means and in direct synchronism with the second conveyor to positively move said locking means to unblocking position and permit release of the articles at predetermined time intervals corresponding to the rate of operation of said second conveyor.

---

2,769,521
FRUIT INSPECTING AND REJECTING MEANS
James M. Hait, San Jose, Calif., assignor, by mesne assignments, to Food Machinery and Chemical Corporation, San Jose, Calif., a corporation of Delaware
Application March 5, 1952, Serial No. 274,917
5 Claims. (Cl. 198—33)

5. In a continuously moving fruit orienting device, the combination of a plurality of rollers forming a pocket therebetween adapted to receive an indented fruit, means for driving said rollers thereby rotating said fruit, a finder positioned in said pocket to engage the surface of the fruit, means for supporting said finder to permit the same to rotate through an arc when said finder locates and passes into said calyx indent, stop means limiting rotation of said finder to a substantially vertical position when the calyx indent is located, a switch, a switch actuating arm adjacent the path of said orienting device, and a contact arm carried by said finder to contact said actuating arm and close said switch when the finder has failed to locate said calyx indent and failed to rotate to said substantially vertical position.

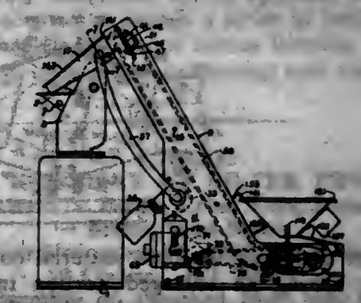
---

2,769,522
CONVEYOR AND STRETCHING MEANS
Fred B. Pfeiffer, Akron, Ohio
Application February 3, 1954, Serial No. 407,900
4 Claims. (Cl. 198—34)

1. A conveyor belt adapted to gradually decrease its initial speed comprising, a plurality of driven pulley drums having parallel axes and being spaced at predetermined intervals along said belt, a series of endless narrow stretchable elastic V belts mounted on and extending from each said drum to the next successive drum only, the drums which are intermediate the end drums of said plurality of drums being common to belts of the next successive series of endless belts, said endless belts being closely spaced laterally of said conveyor, said endless

belts of adjacent said series being disposed on their common drums in alternate relation so as to provide a continuous conveying surface, means for driving each successive drum at a decreased surface speed whereby each series of endless belts gradually decreases its speed from one drum to another and the endless belts have the same speed on their common drums.

---



2,769,523
ARTICLE CONVEYOR
Joseph F. Ochwat, Garfield Heights, Ohio, assignor to General Electric Company, a corporation of New York
Application April 16, 1953, Serial No. 349,195
5 Claims. (Cl. 198—34)

1. An article feeding device comprising a pair of horizontally extending side-by-side parallel endless conveyor belts for supporting the articles in a row therebetween, means connected with said belts for continuously moving them linearly to advance the articles therealong, article lift means comprising a pair of spaced parallel lift bars extending approximately parallel to and alongside respective ones of said conveyor belts, said bars being normally located in a lowered inoperative position disengaged from the articles on the conveyor belts, and means for moving said bars upwardly and rearwardly, while held in a rearwardly inclined position, so as to progressively engage and lift off the conveyor belts and also separate all the articles thereon beginning with the rearmost article and excepting the forwardmost article.

---

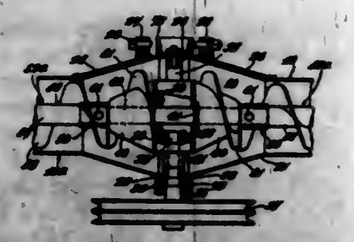
2,769,524
COIN HANDLING MACHINE
Clarence F. Regler, Chicago, Thomas E. Kale, Glenview, and Joseph Singer, Chicago, Ill., assignors to Johnson Fare Box Company, Chicago, Ill., a corporation of Delaware
Application April 18, 1952, Serial No. 282,966
9 Claims. (Cl. 198—37)

1. In a coin handling machine, a bucket type conveyor, means supporting said conveyor for lifting coins from

one level to a higher level, a hopper, having a discharge opening disposed at the bottom end of the conveyor, a platform disposed beneath the opening and adjacent the conveyor and having a discharge edge, and pusher means for moving coins from said platform, over said edge, into the conveyor buckets, said pusher means comprising a pair of pusher bars, means for guiding the bars on the platform for reciprocation thereon between the hopper discharge opening and the platform, means for reciprocating said bars in opposite directions, said means serving to move said bars between a position uncovering said platform to said opening and a position covering said platform and extending beyond the discharge edge thereof.

---

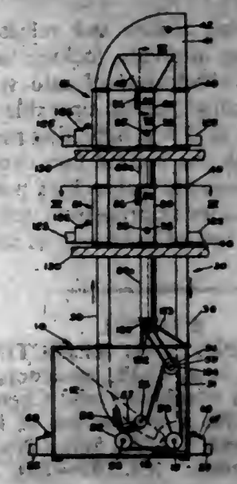
2,769,525
CONVEYORS OR ELEVATORS FOR BULK MATERIAL
William Horsevitch, Melbourne, Victoria, Australia
Application August 4, 1953, Serial No. 372,280
4 Claims. (Cl. 198—75)



1. In combination with an auger conveyor, an endless conveyor attachment comprising a frame having upper and lower runners and a plurality of V-shaped leg members symmetrically mounting said runners in the region of the wider ends of said leg members, an endless conveyor means having upper and lower runs supported on said upper and lower runners respectively, and means at the apices of said leg members for detachably securing the frame to the tube of the auger conveyor to extend parallel with said tube.

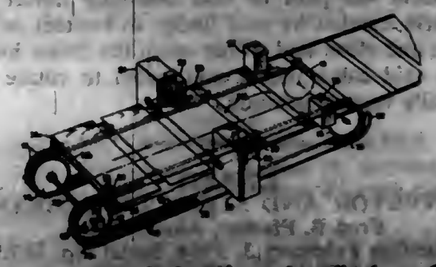
---

2,769,526
CONVEYORS
William Horsevitch, Mont Albert, Victoria, Australia
Application September 13, 1954, Serial No. 455,561
6 Claims. (Cl. 198—75)



1. An auger conveyor for bulk material comprising a straight tube having an enlarged portion intermediate in its length, a gear box mounted within the enlarged tube portion to allow passage of material in said tube portion past the gear box and having an input shaft extending to the exterior of the tube and an output shaft aligned with the tube, and a pair of augers together extending the greater length of the tube and located one upstream and one downstream of the gear box and operatively connected to the gear box output shaft, wherein the tube is formed in two parts having symmetrically flared adjacent ends and said gear box is carried by struts projecting radially inwardly of a ring receiving the extremities of said flared ends and forming therewith said enlarged portion of the tube.

---

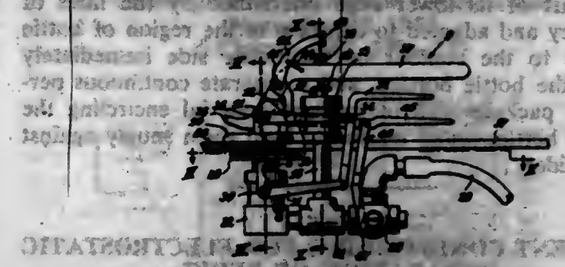


2,769,527
MULTIFLOOR FEEDERS
Marvin L. Smallegan, Zeeland, Mich., assignor to Automatic Poultry Feeder Company, Zeeland, Mich., a corporation of Michigan
Application August 25, 1953, Serial No. 376,410
6 Claims. (Cl. 198—85)

1. In a multiple floor feeder, the combination comprising: a feed hopper on the bottom floor; an elevator, said elevator extending through at least one upper floor; first means for distributing feed on said bottom floor; a first conveyor associated with said feed hopper and first said distributing means; said first conveyor simultaneously discharging into both said first distributing means and said elevator; a second distributing means on said upper floor; the discharge end of said elevator discharging into said second distributing means; a second conveyor associated with said second distributing means; a return means including a chute for returning feed to said feed hopper; said second conveyor discharging into said chute.

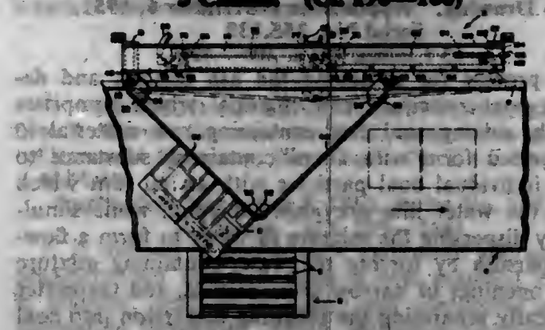
---

2,769,528
CONVEYOR MEANS HAVING PUSHER FINGERS RAISABLE AT SELECTABLE INTERVALS
John J. Goodrich and Richard C. Bentzen, Pensacola, Fla., assignors to St. Regis Paper Company, New York, N. Y., a corporation of New York
Application March 19, 1954, Serial No. 417,353
9 Claims. (Cl. 198—170)



1. In apparatus of the class described, endless belt means; a pair of series of pusher fingers mounted upon said belt means; each of such series comprising a plurality of pusher fingers, each finger being shiftable from a normal position wherein it is out of the path of workpieces to be pushed, into a pusher position, wherein it protrudes into the path of such workpieces, finger-raising means for urging into pusher positions pairs of such fingers, each pair comprising one finger in one such series and another finger in the other series; and means for actuating said finger-raising means at a preselected interval in response to the moving of a raised finger past a preselected norm station.

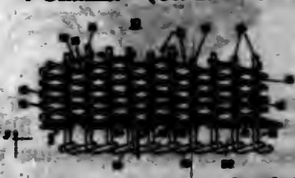
---



2,769,529
CONVEYOR APPARATUS WITH CLAMPING AND STRETCHING MECHANISM
Thomas J. Sortino and James D. Abondo, Newark, N. J.
Application October 12, 1954, Serial No. 461,892
16 Claims. (198—179)

5. Apparatus of the class described comprising a plurality of supports connected together in single file, means for driving said single file of supports in a predetermined closed path, with each of said supports being in combination with a plurality of clamping devices carried by said support, with at least one of said devices located on one side of said support and at least one clamping device located on the other side of said support, each of said clamping devices including a pair of fluid actuable jaws and a third jaw between said fluid actuable jaws, said fluid actuable jaws being movable towards said third jaw to clamp an element between one of said pair and said third jaw and to clamp said support between said other of said pair and said third jaw, and means for supplying fluid pressure to actuate each jaw of said pair independently of the other and in the course of travel of said support maintaining said pair in clamping condition.

---



2,769,530
DEFLECTOR FOR USE WITH CONVEYOR
Richard Powers, Bucknell, Pa., assignor to Bulletin Company, Philadelphia, Pa., a corporation of Pennsylvania
Application October 11, 1955, Serial No. 539,740
5 Claims. (Cl. 198—186)

1. A deflector for use with a conveyor comprising: a deflector arm pivotally mounted at its outer end on an axis substantially perpendicular to the plane of the conveyor, a slide, a second deflector arm pivotally secured to said slide on an axis substantially perpendicular to the plane of the conveyor, the inner ends of said arms being pivotally secured together on an axis substantially perpendicular to the plane of the conveyor, means connected to said slide to advance and retract the slide to, in turn, advance and retract the deflector arms over the conveyor.

---

2,769,531
WOVEN WIRE CONVEYER BELT
Raymond J. Gabe, Rydal, Pa., assignor to Audubon Wire Cloth Corporation of New Jersey
Application May 5, 1953, Serial No. 353,213
4 Claims. (Cl. 198—203)

1. A conveyor belt constructed of helical coils arranged side by side with the turns of each overlapping and having uniform rods extending transversely of the belt through the aligned openings formed by the overlapping turns, with the least dimension of the openings, measured in a plane perpendicular to the rods, appreciably exceeding the rod diameter the improvement in driving means therefor which comprises integral driving extensions on the ends of each rod, including an integral angular portion on the outer end of each extension, and an eye spaced from the ends of the helical coils overlapping the rod and located at the free end of each angular portion and snugly encircling the extension at the end of an adjacent rod to provide a hinge connection therewith, thereby spacing adjacent rods uniformly from one another lengthwise of the belt and ensuring adequate clearance longitudinally of the belt between the individual rods and the surrounding helical coils of the belt.

---

2,769,532
CONTROL FOR MECHANISMS
Charlie H. Witt, Fort Worth, Tex.
Application July 22, 1952, Serial No. 300,271
5 Claims. (Cl. 198—232)

1. In a monitor device for bottle crowning machines having a crown carriage and an automatic stopping mechanism therefor, in combination with an air valve for said stopping mechanism having a stem and connected in an air line, a mounting bracket supporting said valve, a tensioned actuating rod engageable with said stem in axial alignment therewith, a yieldable arm pivoted at its inner end to said mounting bracket and having a disk rotatively supported on its opposite end, the said disk being adapted to engage a series of bottle crowns in said crowning machine, and means forming a portion of the inner end of said arm restraining said valve actuating rod.

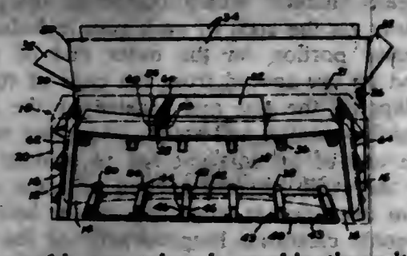
---

2,769,533
ASSEMBLY OF FILTER TIPS
Richard N. Booth, Cross Keys, Jamaica, British West Indies
Application November 21, 1950, Serial No. 546,178
10 Claims. (Cl. 206—56)

1. An assembly of sheathed filter tips for use with hand-rolled cigarets, each filter tip being strongly secured by adhesive to and across one side or face of a flexible

backing strip which is wound into scroll form so that each filter tip is held between an outer and an inner coil of said strip, said filter tips being also less strongly secured by adhesive to an adjacent coil of said strip but

on the other face of said strip, so that by a pull on the free end of said strip, the outermost filter tip can be automatically freed from one connection whilst remaining held by the other.



---

2,769,534

## PACKING CONTAINER FOR CURVED GLASS

Edward J. Lidgard, Royal Oak, Mich., assignor to Studebaker-Packard Corporation, a corporation of Michigan

Application July 12, 1954, Serial No. 442,586
13 Claims. (Cl. 206—62)

1. In a packing container in combination with a curved frangible sheet or the like, a substantially rectangular carton having top and bottom and side and end walls receiving the frangible sheet therewithin, bipartite end packs arranged between the top, bottom and end walls of the carton and engaging opposite ends of the frangible sheet throughout the entire length thereof, each of said bipartite end packs comprising an inner paperboard part having a main flat panel portion and an indented and folded sheet engaging saddle portion integral therewith and defined between a pair of spaced apart paperboard tunnels inwardly offset from the plane of the main panel portion, and an outer paperboard part stitched back to back respectively to the main panel portion and to a flap on one tunnel of the inner part and indented and folded to define a plurality of spaced apart yieldable tunnels each engaging the adjacent end of the carton, the axes of the tunnels of each part extending transversely to the axes of the other for cooperatively establishing a two-way rigidity against collapse of the pack, and bipartite edge spacer members arranged between the top, bottom and side walls of the carton and engaging the curved edges of the frangible sheet, each of said bipartite edge spacer members comprising an outer paperboard flat panel part and an inner paperboard part stitched back to back to the panel part and scored and folded to define a plurality of spaced apart tunnels extending transversely with respect to the length of and being inwardly off set from the plane of the panel part, said last named tunnels being of rectangular cross section and having the parallel walls and inner ends thereof provided with diagonally transverse slots disposed in staggered realtionship to receive and conform to the curvature of the curved edges of the frangible sheet.

---

2,769,535

## PACKAGE

John K. Bruce, South Pasadena, Calif., assignor to Bruce Engineering Corporation, Menlo Park, Calif., a corporation of California

Application September 18, 1952, Serial No. 310,293
11 Claims. (Cl. 206—65)

5. A package consisting of a plurality of bottles arranged in rows symmetrically about an intervening semirigid divider member, the divider member including a longitudinal member disposed between adjoining rows and extending from adjacent the bottom of the several bottles upwardly between adjoining sides thereof with the bottles contacting the longitudinal member along lines of tangency and transverse members disposed between constituent bottles of each row, the longitudinal divider member having an enlarged bead extending along at least

that part of its lower edge intersected by the lines of tangency and adapted to conform in the region of bottle contact to the contour of the bottle side immediately above the bottle bottom, and a separate continuous perimetral package wall of resilient material encircling the several bottles under tension to hold them snugly against the divider.

---

2,769,536

## REAGENT CONDITIONING FOR ELECTROSTATIC SEPARATION OF BERYL

Foster Frans, Hyattsville, Md., assignor to the United States of America as represented by the Solicitor of the Department of the Interior

No Drawing. Application January 21, 1953, Serial No. 332,578
4 Claims. (Cl. 209—9)
(Granted under Title 35, U. S. Code (1952), sec. 266)

1. A process for conditioning beryllliferous ore for electrostatic separation of beryl from associated minerals comprising treating said ore in a first stage of a multistage conditioning operation with a dilute aqueous solution of an alkali, treating the ore in a further stage with a dilute aqueous solution of hydrofluoric acid and washing the ore between said stages.

2,769,537

## PRODUCTION OF HIGH-GRADE PRODUCTS, ESPECIALLY FUELS, FROM RAW MATERIAL CONTAINING PIT COAL OR BROWN COAL

Wilhelm Roerlak, Essen-Bredeney, Walter Mischenborn, Essen, and Erich Nötzold, Essen-Haarhoef, Germany, assignors to Bergwerksverband Zur Verwertung Von Schutzrechten der Kohlentechnik G. m. b. H., Dortmund-Eving, Germany, a German company

No Drawing. Application November 6, 1951, Serial No. 255,132
13 Claims. (Cl. 209—49)

1. A process for removing the ash content and dewatering coal-containing raw material which comprises intimately mixing said coal-containing raw material in finely divided form with an oil-containing substance to wet the individual coal particles with an oil film which replaces the water film previously thereon, while simultaneously dispersing the mixture in water to form a flowable dispersion by forcing the water-containing mixture through openings of narrow cross section, and thereafter mechanically separating the resulting dispersion into coal concentrate and waste water containing the ash in finely divided form.

---

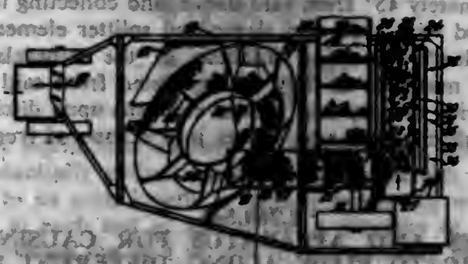
2,769,538

## PROCESS FOR FROTH FLOTATION DRESSING

Wilhelm Roerlak, Essen-Bredeney, Walter Mischenborn, Essen, and Erich Nötzold, Essen-Haarhoef, Germany

No Drawing. Application October 30, 1952, Serial No. 317,826
8 Claims. (Cl. 209—49)

1. A process for the froth flotation dressing of solid materials containing components of varying wettability, which comprises mixing said materials with water and a flotation agent to produce a flowable mixture, subjecting the mixture to a forcing treatment by pressing through narrow cross-sections such as slits and nozzles to produce an essential unaerated mixture of flotation agent wetted components and water wetted components, and thereafter separating the respective components by aeration in a froth flotation zone.



---

2,769,539

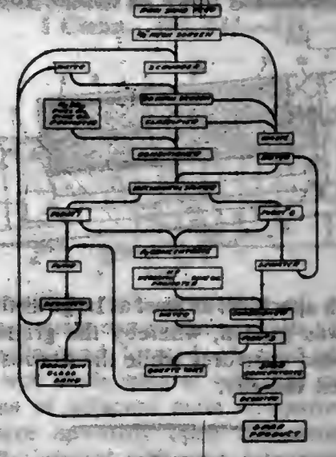
## SEPARATING APPARATUS

Percival James Packman, Twyford, England, assignor to Packman Harvester Developments Limited, London, England, a British company

Application November 17, 1952, Serial No. 320,869
Claims priority, application Great Britain
November 20, 1951
5 Claims. (Cl. 209—78)

1. A separating apparatus for the removal from root crops of foreign bodies, such as stones and clods raised with the crops during harvesting, comprising in combination an endless band conveyor, a multiplicity of upstanding fingers on said endless band, which fingers are spaced apart by distances corresponding approximately to the maximum dimensions of foreign bodies to be removed from the crops, are stiff enough to remain erect under the load of mixed crops and foreign bodies passed on to said endless band for separation, and have resilient tips and walls of rubber or rubberlike material, support means to support said endless band so as to provide a separator length which is canted to the horizontal transversely of its length and is substantially horizontal in the direction of its length, feeder means a one side of and spaced from one end of said separator length through which a mixture of crops and foreign bodies can be fed onto said fingers in said separator length, crop discharge means at the other side of said separator length through which crops are discharged, and means to move said endless band longitudinally of itself so that its movement in its separator length is towards said one end thereof.

---



2,769,540

## METHOD OF BENEFICIATING SAND

Otto R. Brown, Sacramento, Calif., assignor to American Cyanamid Company, New York, N. Y., a corporation of Maine

Application November 8, 1952, Serial No. 319,510
4 Claims. (Cl. 209—166)

1. A method of preparing a glass sand approaching a predetermined analysis, from a raw material excessive in feldspar, deficient in quartz and containing iron-contaminating impurities, which comprises: subjecting said raw material to attrition scrubbing and desliming; conditioning in an acid circuit with a promoter and frother; floating to produce a concentrate rich in iron and a tailing substantially iron-free; effecting the removal of the feldspar content from a portion of said tailing by conditioning said portion with hydrofluoric acid, a frother and promoter, and separating by flotation said conditioned tailing into a fraction containing the removed feldspar and a quartz fraction; and intimately mixing said quartz fraction with the remainder of said tailing to obtain said glass sand; the part of said tailing conditioned being selected so as to remove an amount of feldspar equal to the excess thereof in the original material, there being no

separation of said tailing into feldspar and quartz fractions except by said conditioning operation.

---

2,769,541

## BENEFICIATION OF IRON ORES

Richmond E. Perry, Tuscaloosa, Ala., assignor to United States Pipe and Foundry Company, Burlington, N. J., a corporation of New Jersey

No Drawing. Application April 9, 1953, Serial No. 347,831
17 Claims. (Cl. 209—166)

1. A method of beneficiating siliceous oxidized iron ores which comprises, first activating an aqueous pulp of such ores with a water-soluble compound of an inorganic anion and an alkaline earth metal and conditioning the pulp with a water-soluble inorganic alkali metal compound, then treating the so-activated and conditioned pulp with a petroleum oil in the presence of an anion-active collecting agent selected from the group consisting of fatty acids, rosin acids, and soaps thereof, and subjecting the treated pulp to a gravitational separation whereby a concentrate relatively rich in iron minerals and a tailing containing a major proportion of siliceous material are produced.

---

2,769,542

## BENEFICIATION OF BAUXITE

John Congdon Russell, Kitwe, Northern Rhodesia, and James Stephen Kennedy, Stamford, Conn., assignors to American Cyanamid Company, New York, N. Y., a corporation of Maine

No Drawing. Application April 3, 1953, Serial No. 346,777
9 Claims. (Cl. 209—166)

1. A method of beneficiating bauxite-containing ores which comprises conditioning in an acid circuit with a petroleum sulfonate a deslimed ore ground to about 35 mesh; and floating to recover a flotation concentrate rich in $Al_2O_3$ and low in silica.

---

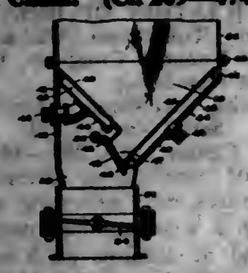
2,769,543

## SEPARATION OF COMMINUTED CELLULOSE ACETATE

Stanley Bird and Albert Robinson, Spondon, near Derby, England, assignors to British Celanese Limited, a corporation of Great Britain

Application January 5, 1954, Serial No. 402,344
Claims priority, application Great Britain
January 6, 1953
3 Claims. (Cl. 209—235)

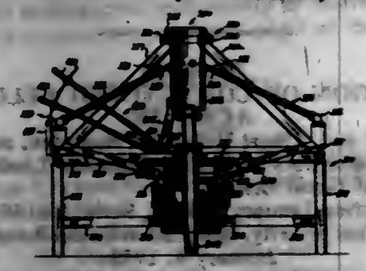
1. A method of separating particles of fibrous character from particles of granular character in a comminuted cellulose acetate material containing both kinds of parti-



cles, said method comprising grading the material to a size such that all its particles can pass through apertures of a given size and then causing the graded material to slide and roll unidirectionally down an oblique rotating surface

perforated with apertures at least as large as those to which the material was graded, whereby the granular particles pass through said apertures while the fibrous particles remain supported thereby.

---



2,769,544
MATERIAL TRAP
Joseph H. Morrow, Hokendauqua, Pa., assignor to Fuller Company
Application December 15, 1951, Serial No. 261,874
1 Claim. (Cl. 209—474)

In an apparatus for separating foreign material from a stream of material moving through a conveyor trough, a container disposed beneath the trough and in communication with the interior thereof, a pair of aeration units within the container, each unit including a plenum chamber closed at its top by a flat gas-permeable wall and the units being disposed at opposite sides of the container with their top walls lying at opposite angles to the vertical and defining a wedge-shaped bottom for the container, one unit being longer than the second and having its lower end beneath and spaced from the lower end of the second unit, a discharge port between the lower ends of the units, a gate operable to open and close the port, and means for supplying a gas under pressure to the plenum chambers for diffusion through the gas-permeable walls into the contents of the container.

---

2,769,545
APPARATUS FOR SEPARATING AND CONCENTRATING GRANULAR MIXTURES
Harry B. Cannon, Lakeland, Fla.
Application November 17, 1954, Serial No. 469,414
8 Claims. (Cl. 209—493)

1. In a separating unit for separating valuable minerals from a slurry containing mineral-bearing ores including gangue materials, the combination of a vertically extending conduit for delivering a slurry vertically upwardly, a separating battery including a plurality of pinched-slice type troughs arranged in an annular array about said conduit and each having raised converging sidewalls and a sloping floor surface to thereby provide the separating battery with the shape of an inverted frustrum of a cone said separating unit having supporting means for mounting the said battery and said conduit in an upright position, distributing means connected to said conduit and positioned to cooperate with the said separating battery for delivering the slurry thereto, a plurality of concentric slurry-splitting members surrounding said conduit, each member including a tubular depending sleeve portion concentrically mounted about said tubular conduit and including at its vertical edge a circular slurry splitter element formed of rubber and having converging wall surfaces defining a splitter edge directed radially outwardly and upwardly at an angle of approximately 45° from said sleeve, and collecting means associated with each said sleeve and splitter element for independently receiving fractions of the minerals and gangued materials as they are separated from said mineral-bearing ores by said splitter elements upon discharge of said slurry from said sluices into a zone of free fall.

---

2,769,546
PROCESS AND APPARATUS FOR CAUSING A LIQUID TO FLOW ALONG DIFFERENT CONDUITS DEPENDING ON THE VISCOSITY OF THE LIQUID CONCERNED
Frank J. Fontein, Heerlen, Netherlands, assignor to Staatsmijnen N. V., Heerlen, Netherlands
Application October 13, 1952, Serial No. 314,586
Claims priority, application Netherlands October 17, 1951
15 Claims. (Cl. 210—1)

1. Apparatus for causing a liquid to flow along different conduits according to the viscosity of said liquid comprising a closed radially symmetrical chamber, a circular axial discharge aperture in said chamber, a feed passage discharging into said chamber on a radius exceeding that of said discharge aperture, whereby said chamber is adapted to form a liquid vortex therein discharging through said discharge aperture in the form of a hollow diverging cone, a discharge receiving device positioned opposite said discharge aperture, said device including an annular discharge intercepting edge of greater diameter than said discharge aperture, axially spaced from and axially aligned with said discharge aperture, and means for separately receiving liquid passing outside and inside said discharge intercepting edge.

---

2,769,547
ARTICULATED SURFACE WASHING DEVICE WITH OSCILLATORY NOZZLES FOR FILTER BEDS
Abraham Adler Hirsch, New Orleans, La.
Application June 25, 1951, Serial No. 233,378
9 Claims. (Cl. 210—120)

1. A reactively driven rotary filter sweep having radial conduits on either side of a central suspension,

nozzles flexibly attached to said conduit, the flexible connection therefor being elastic and having a minimum section modulus of the area of wall thickness thereof arranged parallel to the axis of said radial conduit, said nozzles being adapted to flex by hydraulic reaction in a plane inclusive of said conduit and inclined about 15 degrees downwardly below the horizontal.

---

2,769,548
LIQUID FILTER
Ernst Max Tischer, Augsburg, Germany
Application April 29, 1952, Serial No. 284,942
Claims priority, application Germany March 3, 1952
7 Claims. (Cl. 210—164)

1. A liquid filter element for fine filtering, comprising a substantially cylindrical drum of a diameter at least equal to its axial length, a radially outwardly extending flange at each end of said drum, a plurality of annular gaps through the wall of said drum providing bands adjacent each flange and between the gaps, the width of gaps and bands being such that the area of the bands at least equals the gaps, a sieve strip woven of liquid-impervious filments, said strip being of a width equal to the distance between said flanges and having one end secured to said drum, said strip being wound a plurality of times about said drum under such tension as to create a substantial radial pressure in said strip against the drum, whereby the layers of said strip tightly engage against each other and against said bands with a substantial and uniform radial pressure at all points.

---

2,769,549
SWIMMING POOL CLEANING TOOL
Suzanne G. Bixby, Northridge, Calif.
Application February 23, 1954, Serial No. 411,898
3 Claims. (Cl. 210—236)

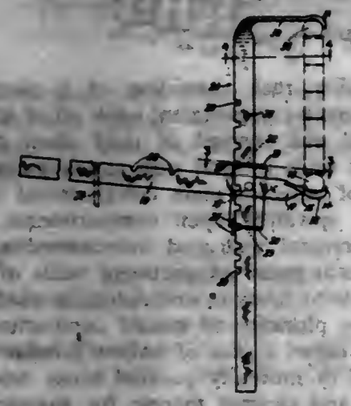
1. A swimming pool cleaning tool comprising a body member having a depending flange around the periphery thereof, bristles secured to said flange about a portion of the periphery of the body member, and an elongated handle secured to said body member, said body member being hollow and provided with apertures in the upper surface thereby permitting circulation of fluid, the body member being generally polygonal with the bristles being disposed on the sides and rear thereof, the flange on the front of said body member terminating above the lower end of said bristles thereby forming an entrance for permitting water to flow into the interior of said body member, a trap door pivotally suspended from the front of said body member and forming a portion of said flange, a stop on said body to preclude forward swinging movement of the door beyond a vertical position thereby providing a check valve for fluid passing through the body member.

2,769,550
NOVELTY UTILITY ARTICLE
Katherine Beck Rollins and Mark L. Rollins, Valley Stream, N. Y.
Application March 31, 1952, Serial No. 279,564
1 Claim. (Cl. 211—11)

A novelty utility rack consisting of a plurality of mutually spaced main compartment walls all of which are mutually parallel and formed of rigid sheet material, curved floor web walls integral with and interconnecting lower portions of adjacent main compartment walls to form successive upwardly open compartments, curved top web walls integral with and interconnecting upper portions of adjacent main compartment walls of successive compartments to form an undulating upwardly open serially successive plurality of spaced compartments integral with each other, a pair of hollow tubular support runners disposed in mutually parallel array below said floor web walls and secured thereto for supporting the same, a first integral shallow rack lip trough carried by one of said main compartment walls at its upper end for supporting articles, a second integral shallow rack lip trough carried by another of said main compartment walls at its upper end for supporting articles, said first and second rack lip troughs being carried by main compartment walls at opposite ends of said utility rack so as to extend in opposite directions outwardly therefrom, and an upstanding stub wall integral with said second rack lip trough with a socket formed in said stub wall and adapted for supporting articles seated in said socket.

---

2,769,551
DISPLAY AND DELIVERY STAND
George A. Just, Scarsdale, N. Y., assignor to The Grand Union Company, East Paterson, N. J., a corporation of Delaware
Application January 26, 1953, Serial No. 333,037
3 Claims. (Cl. 211—49)



1. A display and delivery stand comprising supports, a plurality of vertically spaced shelves mounted on said supports and arranged one above another in inclined positions sloping from the rear to the front of the stand at an angle sufficient to cause articles placed on the shelves to move forward by gravity on removal of articles from the front of the shelves, each shelf including a carriage in the form of a frame, parallel article supporting and guiding means mounted on said frame and extending from the front to the rear thereof for guiding articles in their movement on said shelves under the action of gravity, tracks mounted on the supports along which said carriage is movable from a retracted display and delivery position to an extended loading position, cooperating means on said supports and tracks adjustable to vary the angular inclination of said tracks and shelves with respect to said supports, and manually operable

latch means releasably retaining said carriage in said retracted position, said latch means being mounted on the carriage near the front thereof and in position to be operated by a person grasping the front of the carriage and controlling its forward movement on release of the latch means.

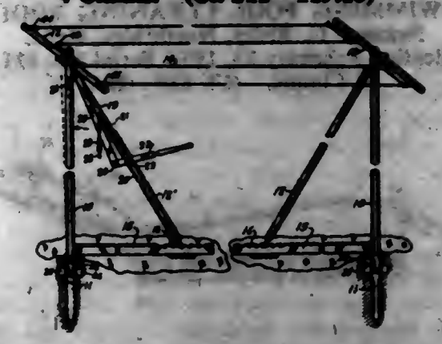
---

2,769,552
GARMENT HANGER
Irving Goldman, New York, N. Y.
Application May 19, 1953, Serial No. 355,989
3 Claims. (Cl. 211—86)

1. A clothes hanger of the character described for removably mounting upon door hinges having hinge-pins of varying lengths and extending hinge-pin knuckles, a main hanger bar for horizontal extension endwise from a door hinge, means at the inner end of said main bar for releasably engaging the lower end of a hinge-pin knuckle, said means comprising a depression facing upwardly, a pair of upstanding opposed lugs adjacent said depression at the extreme end, and a pair of opposed shoulder lugs at the inner end adjacent said depression, spaced notches along the upper edge of said main bar for receiving the wire hooks of garment hangers, an auxiliary hanger link bar for positioning vertically adjacent the hinge and across the inner end of said main hanger bar, said auxiliary hanger link bar having an upper horizontal short arm and a vertical long arm bent at a right angle thereto, means at the inner end of said short arm for releasably engaging the upper end of said hinge-pin knuckle, said last-named means comprising a depression facing downwardly and a pair of opposed lugs adjacent said last-named depression at the extreme end, notches in the outer edge of said long arm, a substantially U-shaped member including a vertical plate and top and bottom arms extending at right angles to the vertical plate, said last mentioned arms having registering elongated slots through which the vertical long arm of the auxiliary hanger link bar extends, said vertical plate being pivotally mounted on said main bar adjacent the inner end thereof, the outer edge of the slot in the top arm of the U-shaped member selectively engaging the notches in the outer edge of said long arm for adjustably connecting the main and auxiliary bars in clamping engagement with the hinge pin.

---

2,769,553
DISPLAY AND LIKE DEVICES
William Gray Horton, Northampton, England
Application February 19, 1953, Serial No. 337,846
1 Claim. (Cl. 211—87)



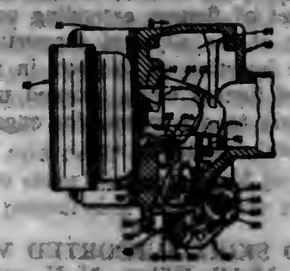
In a display device of the type including a series of rectangular plates supported on spaced parallel flanged bars, a construction in which each plate is formed from a single sheet metal blank with a central rectangular area and four rectangular extensions thereto based on its four sides, the smaller sides of all the rectangular extensions being of the same length, the central rectangular area having a plurality of spaced rows of elongated slit perforations parallel to two of its sides, and a further plurality of parallel spaced rows of elongated slit perforations at right angles to the said first mentioned rows and parallel to its other two sides, whereby the perforations as a whole define a plurality of adjoining squares of unit area, and in which the last rows of slit perforations adjacent the sides of said rectangular area are spaced from said sides at a distance equal to half the side of such square, slit perforations of half the length of the other perforations continuing the spaced rows of parallel slit perforations and terminating at the sides of the rectangular area and there opening into rows of similarly spaced

rectangular holes coming beyond and bounding the rectangular area and located in the four rectangular extensions, each of the said rectangular extensions at its outer corners having similar rectangular portions cut away to leave its outer longer side with a central outer projecting portion, the rectangular extensions being bent at right angles along the sides of the rectangular area to constitute main flanges, and said central outer projecting portions of the rectangular extensions being bent along median lines parallel to the sides of the rectangular area to form auxiliary flanges on the main flanges and to provide four hooks bounding four channel-like spaces so that any two parallel hooks may engage said spaced parallel bars.

---

2,769,554
REMOVABLE CLOTHESLINE SUPPORT AND TENSIONING DEVICE
William L. Bodine, Elyria, Ohio
Application September 26, 1951, Serial No. 248,400
4 Claims. (Cl. 211—119.15)

1. A removable clothesline pole and tensioning mechanism, including an anchoring socket adapted to be positioned in the ground and extending to the surface thereof; an upright clothesline supporting post adapted to be inserted and removed from said socket, said post extending below the surface of the ground into said socket; a laterally extending base connected to said post and interconnected with said socket; said base having a plurality of notches along the upper surface thereof; an adjustable diagonally arranged brace member pivoted to said post adjacent the upper portion thereof, the lower end of said brace fitting into one of said notches on said base member; said diagonal brace member including two telescopic sections; means to extend or retract said sections including a hand operated toggle mechanism interconnected between said sections forming means to tension the clothesline; and means to lock said brace in said adjusted position.



2,769,555
RAILWAY FRONT END STRUCTURES
Ewing L. Johnson, Yonkers, N. Y.
Continuation of abandoned application Serial No. 26,554, May 13, 1948. This application August 19, 1953, Serial No. 375,136
16 Claims. (Cl. 213—6)

1. In a railway locomotive front end construction unit, main longitudinal framing elements forming an elongated pocket for receiving a draft gear and an associated coupler, a front structure depending from said framing members and including parts projecting forwardly and laterally outwardly therefrom, and constituting an obstacle-deflecting pilot member, said front end structure including elements extending from the outer lower portions of said obstacle-deflecting pilot member generally diagonally rearwardly, upwardly and inwardly to said main framing elements at points on the latter rearwardly of said coupler and draft gear-receiving pocket, whereby said obstacle-deflecting pilot member is braced from said main framing members at points rearwardly of draft gear which may be mounted in the pocket.

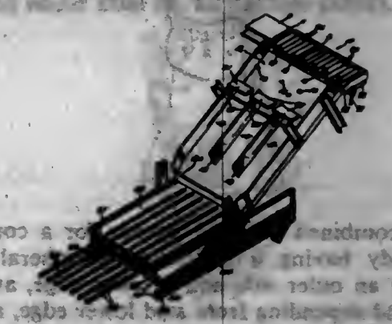
---

2,769,556
CAR COUPLER
William J. Metzger, East Cleveland, Ohio, assignor to National Malleable and Steel Castings Company, Cleveland, Ohio, a corporation of Ohio
Original application November 3, 1949, Serial No. 125,323, now Patent No. 2,709,007, dated May 24, 1955. Divided and this application January 4, 1954, Serial No. 401,895
8 Claims. (Cl. 213—127)

1. In a car coupler having a head, a pivoted knuckle, a knuckle thrower for opening said knuckle, a lock having a leg extending downwardly into an opening in said head, and means for actuating said lock to unlock the coupler, the rear wall of said opening having a forwardly extending abutment portion for engaging said lock leg when said lock is in locking position, said leg having a rearward projection spaced from said rear wall when said lock is in said last mentioned position, said projection being adapted for engagement with said thrower to actuate the latter during unlocking of the coupler.

---

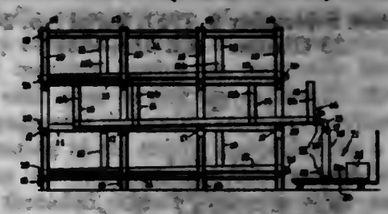
2,769,557
SKID INVERTER
Norman T. Olz, Glen Rock, N. J., assignor to Rutherford Press, Inc., Rutherford, N. J., a corporation of New Jersey
Application February 11, 1953, Serial No. 336,328
2 Claims. (Cl. 214—1)



1. A device for inverting sheets of material stacked on a skid comprising a rigid hoop of circular unobstructed outline, at least two substantially perpendicular chord sections on said hoop adapted to receive adjacent sides of a stack of sheets, another chord section opposite one of said perpendicular chord sections, said last-mentioned chord section having clamping screws extending there-

from to clamp said stack of sheet material in said chord sections, whereby said hoop may invert said stack of sheets while maintaining alignment thereof.

---



2,769,558
APPARATUS FOR PRODUCING A GLUED UNIT LOAD
Otto William Ehlers, Hermosa Beach, Calif., assignor to Unitbinder, Inc., Los Angeles, Calif., a corporation of California
Application July 20, 1953, Serial No. 369,119
13 Claims. (Cl. 214—6)

1. In a device for receiving cartons from a conveyor and assembling them into a unit load, the combination of: a terminal conveyor section for receiving cartons in single file order, means for moving a group of cartons laterally from said conveyor section toward a stacking location, selectively operable orienting means for turning cartons at right angles during the course of such lateral movement, a retractable member at said stacking location adapted to receive a plurality of groups of cartons, and means for retracting said member from below said groups of cartons to form a layer of a unit load.

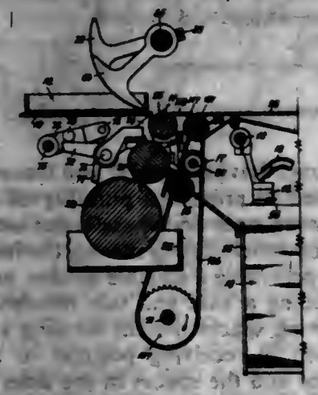
---

2,769,559
STALL TYPE RACK
George Robert Johnson, Milford, Conn.
Application August 13, 1952, Serial No. 304,095
1 Claim. (Cl. 214—16.4)

In a stall type rack having vertical and transverse members interconnected to provide a plurality of superposed horizontally disposed open-ended stalls for storing heavy objects movable by article lifting means, the improvement which comprises providing a slidable section in each stall, said section including a base and side members with the side members having spaces therein forming an open-top unit adapted when in receiving position to receive the object to be stored and the spaces in the sides permitting the lifting means to deposit the object on the base without interference; stop means at the rear of each stall to en-

gage the section and prevent movement of the section therethrough; means mounting said slidable sections for movement through the front open end of the stall for substantially the full length of the section to present the open top of a selected slidable section to receive heavy objects deposited directly by article lifting means, said means including a plurality of longitudinally spaced, transversely extending, elongate, ball bearing supported rollers in each stall extending thereacross and having their axes lying in a rearwardly inclined plane whereby the sections are urged rearwardly to said stop means and against unintentional movement through the front of the stall; and a movable carriage having a vertically extensible support post thereon, said post having means at the upper end to interlock with the selected section and support the front end of the slidable section in all projected positions.

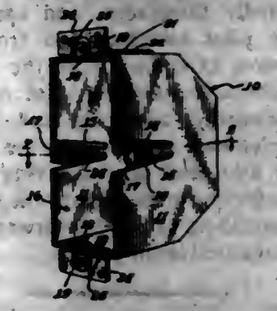
---



2,769,560
**BOTTLE CAP AND OPENER**
Robert F. Lee, Houston, Tex.
Application December 10, 1954, Serial No. 474,682
4 Claims. (Cl. 215—46)

4. In a combined cap and opener for a container, a circular body having a depending peripheral crimped skirt having an outer side and a lower edge, an integral sleeve on and depending from said lower edge, an opener member comprising a pair of elongated legs in lateral contact with each other and securably engaged lengthwise through said sleeve, said legs having upper ends projecting above said sleeve and bearing against said outer side of the skirt, and a head on the upper ends of and connecting the upper ends of the legs and overlying the circular cap body, said head being triangular and comprising laterally oppositely extending base portions on the upper ends of the legs, said base portions terminating in convergent side portions having terminal ends connected together, said base and said side portions being in contact with the circular cap body.

---



2,769,561
**BOX MAKING MACHINES**
George W. von Hofe, Bound Brook, and Edwin K. Wolff, Palisades Park, N. J., assignors to New Jersey Machine Corporation, Hoboken, N. J., a corporation of New Jersey
Application September 5, 1951, Serial No. 245,194
23 Claims. (Cl. 216—55)

1. In a machine for applying sheets to articles, means for supporting a stack of sheets with their leading edges in a fixed position in the stack, means for feeding successive sheets from the stack so that their leading edges will arrive at a place of registry in a fixed, predetermined interval of time irrespective of the lengths of such sheets, and means for successively feeding articles to such place of registry to progressively attach a surface thereof to such sheets, and including means for varying the approaching relation of an article to a sheet so as to vary the position of initial engagement of such article surface with the surface of such sheet at said place of registry.

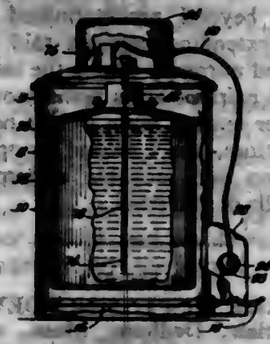
---

2,769,562
**ELECTRICAL BOX**
Nathan H. Randolph, Aurora, Ill., assignor to All-Steel Equipment Inc., Aurora, Ill.
Application October 13, 1955, Serial No. 540,434
10 Claims. (Cl. 220—3.4)

1. For mounting within an opening in a supporting wall, an electrical box having two sets of mounting flanges spaced apart a distance substantially corresponding to the thickness of said supporting wall, the first of said sets extending outwardly from said electrical box for engagement with the front face of said wall, and the second of said sets being carried by deformable tongue means anchored to side wall portions of said box and extending forwardly and inwardly across openings therein, said second set of flanges extending outwardly and terminating short of the adjacent supporting wall portions to facilitate insertion of the box in said opening, said second set of flanges being adapted upon outward deformation of said tongue means for engagement with the rear face of said supporting wall.

---

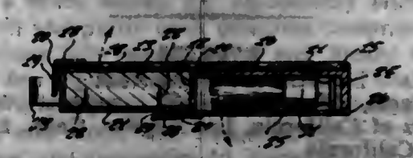
2,769,563
**INSULATED SKIRT SUPPORTED VESSELS**
Nicholas A. Weil, Middle Village, N. Y., assignor to The M. W. Kellogg Company, Jersey City, N. J., a corporation of Delaware
Application June 22, 1955, Serial No. 517,231
8 Claims. (Cl. 220—9)



1. A vessel adapted in use to be subjected to elevated temperatures comprising a shell having a bottom section of diminishing diameter, a supporting skirt member having an end positioned on said vessel in the region of said bottom section, a weld metal deposit at said end uniting said skirt member to said vessel, and a depth of insulation forming a heat barrier between said vessel and the atmosphere and said skirt member and the atmosphere, said skirt member and said vessel providing a crotch formation at their juncture of increasing area in the direction

of the bottom of the vessel, said insulation applied to substantially the whole internal surface of said skirt below a level below said juncture at least approximately 10 times the thickness of said skirt member, said insulation applied to substantially the whole external surface of said bottom section inward of said skirt member to said level to provide an annular space at said crotch formation in part defined by exposed surface of said vessel and said skirt for heat flow by radiation and convection from one to the other of said vessel and said skirt members.

---



2,769,564
**PORTABLE MILK PASTEURIZER**
Oscar C. Hoppens, Chicago, Ill.
Application January 13, 1954, Serial No. 403,793
1 Claim. (Cl. 220—13)

A portable pasteurizer comprising an outer container for accommodating a liquid heating medium, an inner container disposed within said outer container, a cover means for said inner container, means for securing said cover means on said inner container in a liquid-tight manner, a laterally and outwardly extending shoulder formed on said inner container, a laterally extending bracket mounted on the inner vertical surface of said outer container and positioned to receive and support said shoulder, and restraining means mounted on the inner vertical surface of said outer container, said restraining means being adapted to engage said securing means and thereby hold said inner container against said bracket whereby positively to prevent vertical displacement of said inner container within said outer container and thereby to insure that the entire outer surface of said cover means is subjected to the pasteurizing temperature of the liquid heating medium.

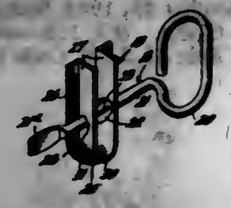
---

2,769,565
**COMPACT SHAVING KIT**
John Scalia, Manhasset Harbor, N. Y.
Application October 18, 1953, Serial No. 386,191
1 Claim. (Cl. 220—20)

A compact shaving kit comprising a substantially flat rectangular casing, a first compartment at a first longitudinal end of said casing opening to the top of said casing, a second compartment at a second longitudinal end of said casing opening to the bottom of said casing, said first and second compartments lying between common parallel horizontal planes and being separated from each other by a transversely extending vertical wall disposed midway between said longitudinal ends of said casing, a first horizontal wall extending longitudinally from the lower edge of said vertical wall and forming a floor for said first compartment, a second longitudinal horizontal wall extending from the upper edge of said vertical wall in a direction opposite to said first horizontal wall and forming a floor for said second compartment, said vertical wall being of a height corresponding to the depth of each said compartment, a carrying handle disposed at said first longitudinal end of said casing, a first cover having vent openings hingedly connected to the top of said second longitudinal end adapted to overlie said first compartment, a second cover hingedly connected at the bottom of said second longitudinal end of said casing adapted to overlie said second compartment, said first cover extending between said second end and said first end of said casing and said second cover extending between said second end and said vertical wall of said casing, and releasable means for securing each of said covers in closed position.

---

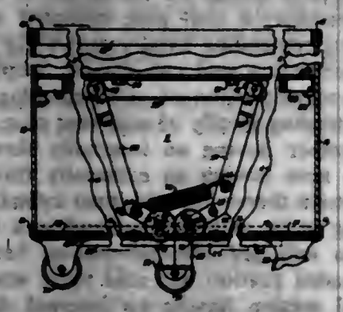
2,769,566
**FILLING PLUG FOR FUEL AND PRESSURE CONTAINERS**
Morris Thompson, Baltimore, Md., assignor to the United States of America as represented by the Secretary of the Army
Application October 23, 1953, Serial No. 388,077
1 Claim. (Cl. 220—44)
(Granted under Title 35, U. S. Code (1952), sec. 266)



A vented plug closure for metallic receptacles comprising a plug body member including an externally threaded outer cylindrical wall member provided with external threads to engage said receptacle, an inner cylindrical member positioned within said outer cylindrical wall member and a flange joining an axially inner portion of said outer cylindrical member with the axially outer portion of said inner cylindrical member thereby forming a cup-shaped inclosure; a vent member comprising a cup member positioned within said cup-shaped enclosure and a nose portion extending axially inwardly from said cup member and in engagement with the interior of said inner cylindrical member, said cup member extending axially outwardly past said cup-shaped inclosure, hand grip means on the axially outer portion of said cup member; a vent plug mounted within said nose portion and extending axially outwardly for a substantial distance within said cup means, coupling means on the axially outer portion of said vent plug, a central passageway extending axially of said vent plug; said inner cylindrical member having an internally threaded portion, and said nose having an externally threaded portion in engagement therewith; said inner cylindrical member terminating at its axially inner end in a valve seat, and having an enlarged internal section between said internally threaded portion and said valve seat, said enlarged internal section having an internal diameter at least as great as the maximum diameter of the externally threaded portion of said nose member; said nose member carrying at its axially inner end a valve disk, said valve disk having a frustoconical surface radially within and extending past said valve seat, said seat and disk being formed so as to make substantially line contact; a central bore in said nose member in alignment and communication with said central passageway, at least one radial bore extending from said central bore to said externally threaded portion; said parts being so proper-

tioned that when said cup member is turned in one direction said nose member may be screwed inwardly to a point where said valve disk is disengaged from said valve seat and the outer ends of said radial bores are positioned within said enlarged internal section, while when it is turned in the other direction the said nose portion may be screwed outwardly until said valve disk contacts said valve seat and the outer ends of said radial bores are positioned within said internally threaded portion, said handgrip means including a wheel portion extending outwardly from said cup member and a lever pivotally mounted on said wheel portion in such a manner that when swung into one position it extends across the end of said vent plug and said cup member and when in another position it extends outwardly from said cup member.

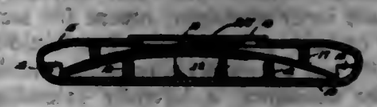
---



2,769,567
**CAN OPENER KEY AND STRIP GUIDE**
Clyde H. Turbett, Harrisburg, Pa.
Application April 23, 1953, Serial No. 350,611
1 Claim. (Cl. 220—52)

A strip guide permanently rotatably mounted on a slotted can opening key comprising a strip of sheet metal bent into U-shape to provide elongated substantially parallel leg portions and a connecting bight portion, said leg portions having opposed openings therein intermediate the ends and edges thereof rotatably receiving the shaft portion of the can opening key, and a planar flange integrally connected to adjacent edges of said leg portions and to the adjacent edge of said bight portion, said flange extending laterally outward from said leg and bight portions substantially at right angles thereto the flange and the web of the metal strip jointly having an L-shaped cross-section, the flange providing bearing engagement with the surface of a can.

---

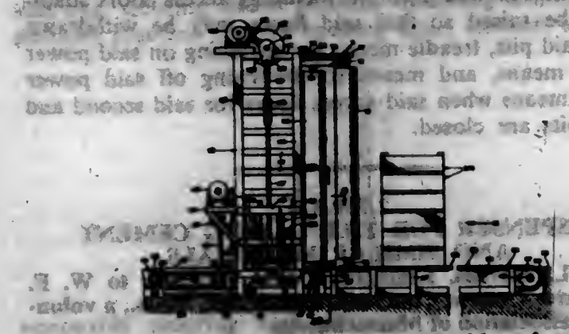


2,769,568
**TRUCK WITH FALSE MOVABLE BOTTOM**
Noah W. Estes, Lincolnton, N. C., assignor to Excel Textile Supply Company, a partnership
Application April 6, 1953, Serial No. 347,097
7 Claims. (Cl. 220—93)

4. In a bobbin truck having a wheeled frame, side walls and a vertically movable false bottom, the combination of means for maintaining said false bottom in a constant predetermined attitude relative to said side walls and for causing vertical movement of said bottom in response to variation in the amount of weight placed thereon, said means comprising a pair of transverse parallel shafts rotatably mounted on said frame intermediate the ends thereof, means connecting said shafts causing simultaneous rotation of the same in opposite directions, a first pair of transversely spaced rigid parallel arms fixed at their lower ends to one of said shafts in perpendicular relation thereto and extending upwardly and outwardly at an angle from said shaft, a second pair of transversely spaced rigid parallel arms fixed at their lower ends to the other of said shafts in perpendicular relation thereto and extending upwardly and outwardly from said shaft, said first and second pairs of arms diverging upwardly and outwardly at equal angles away from a vertical plane parallel to and between the two shafts, a first group of rollers rotatably mounted on the upper ends of said arms, a pair of spaced parallel longitudinally extending trackways on the under surface of said movable bottom, means for permitting longitudinal movement of said rollers along said trackways and otherwise preventing relative movement between said rollers and said trackways, stops limiting longitudinal movement of said rollers relative to said trackways beyond predetermined points, resilient tension means extending between said first and second pairs of arms and normally urging the same together, said first and second pairs of arms being movable apart from each other under tension upon weight being placed upon the movable bottom, and a second group of rollers rotatably mounted on said movable bottom in engagement with the side walls of said truck.

---

2,769,569
**BLADE DISPENSING DEVICE**
Robert L. Sinclair, Dedham, Mass., assignor to The Gillette Company, a corporation of Delaware
Application September 16, 1950, Serial No. 185,188
5 Claims. (Cl. 221—37)

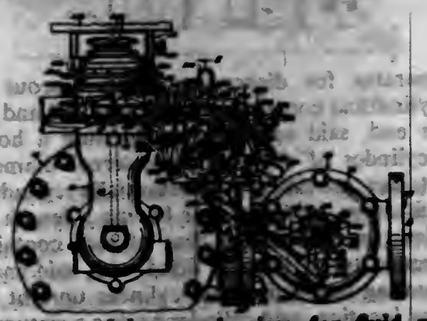


1. A blade-dispensing device comprising a casing having a top opening, a stack of flexible and resilient blades disposed in said casing in alternately staggered and overlapped relation, means for bowing the central portion of said stack of blades towards said top opening to urge an end of the uppermost blade into said top opening, and a slide mounted for reciprocable movement relative to said casing and closing said top opening, said slide having a window wider than the width of the blades, said slide normally restraining the uppermost blade end and being reciprocable between alternate positions in which its window is in register with successive restrained blade ends to permit said successive blade ends to extend through said top opening and said window and beyond the dispensing device for manual removal of the blades therefrom.

---

2,769,570
**BOX UNSTACKER**
Loyd Adams, Maywood, Calif., assignor to Calavo Growers of California, Los Angeles, Calif., a corporation of California
Application June 13, 1952, Serial No. 293,361
3 Claims. (Cl. 221—225)

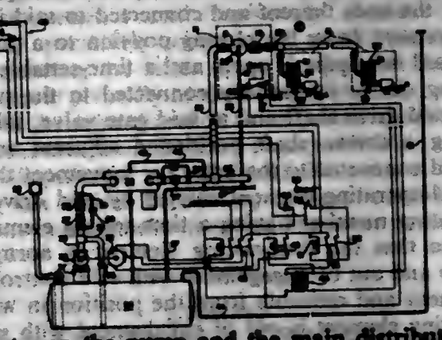
2. In a machine for handling boxes, the combination of a frame, a feeder conveyor supported by said frame and adapted to convey a stack of boxes, said feeder conveyor including a pair of spaced endless members, an unstacker assembly intermediate the ends of said frame in a position to operate upon a stack of boxes on said feeder conveyor, said unstacker assembly including means for simultaneously lifting all but the lowermost of the boxes in a stack, said means including a vertically reciprocable carriage, a bracket member on said carriage, said bracket member being provided with an aperture, a discharge conveyor having a receiving end and a delivery end and including a pair of spaced endless members, the delivery end of said discharge conveyor being pivotally connected to said frame and the receiving end thereof extending into nested relation between the endless members of said feeder conveyor, and means operably connecting the receiving end of said discharge conveyor with said carriage for moving said receiving end in timed relation with



the operation of said unstacker assembly whereby the lowermost box is transferred from said feeder conveyor to said discharge conveyor, said last means including a rod extending upwardly from the receiving end of said discharge conveyor and through said apertured bracket member, the upper end of said rod being provided with stop means engageable by the upper surface of said bracket member.

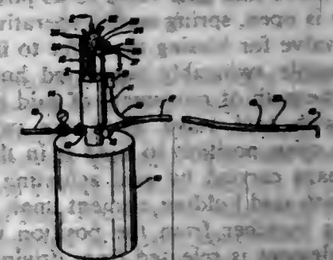
---

2,769,571
**REGISTER COORDINATED CONTROL MECHANISM FOR CLOSING A METER VALVE**
Elmer Thereson, Pittsburgh, Pa., assignor to Rockwell Manufacturing Company, Pittsburgh, Pa., a corporation of Pennsylvania
Application December 13, 1951, Serial No. 261,448
28 Claims. (Cl. 222—29)



1. In predetermining mechanism for fluid meters, a fluid flow control valve, actuating means operatively connected with said valve manually operable to open the valve, a valve closing spring connected with said valve energized by opening of said valve, said actuating means including a shaft, means for successively latching said valve in full and partly open positions comprising a pair of circumferentially spaced stops and means mounting said stops for angular movement with said shaft, a pivoted latch lever spring biased toward latching engagement with said stops, and means operable at predetermined times and responsive to increments of fluid flow through the meter to trip said latch lever out of engagement with the respective stops and permit staged closure of said valve by said spring.

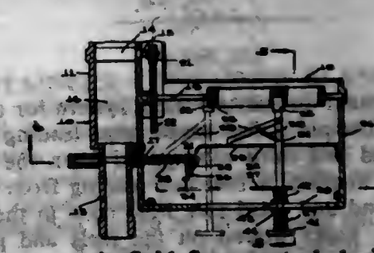
---



2,769,572
**MULTIPLE REFUELING SYSTEM**
Gerald J. Harmon, Beverly Hills, Harwood D. Hooker, Sunland, and Robert T. Rommel, Burbank, Calif., assignors to Lockheed Air Terminal, Inc., Burbank, Calif.
Application November 15, 1952, Serial No. 320,726
8 Claims. (Cl. 222—26)

1. A multiple station refueling system comprising a fuel storage tank, a pump drawing fuel from the tank, a main distribution line connected to the pump to directly receive fuel therefrom and having the individual stations connected thereto, a master fuel-water separator interposed between the pump and the main distribution line, pump starting and stopping controls at each refueling station, and a master pump control arranged to stop the pump and deactivate the station controls.

---



2,769,573
**MOLD FILLING APPARATUS**
Theodore A. Miller, Cuyahoga Falls, Ohio
Application September 22, 1954, Serial No. 457,685
3 Claims. (Cl. 222—43)

1. Mold filling apparatus, comprising a storage tank for containing a liquid molding material, a measuring cylinder having an inlet communicating with the liquid in the tank, means for applying fluid pressure to the liquid in said tank to force it into said cylinder, a piston in said cylinder and having a piston rod and adjustable stop means limiting movement of said piston rod under pressure of the liquid, said stop means comprising a turret having a plurality of projecting stops engageable with said piston rod, means mounting said turret on said measuring cylinder with the turret axis lying in, but perpendicular to, the path of said piston rod, and power means for moving said piston from said stop means against pressure of the fluid, to deliver a measured charge from said cylinder.

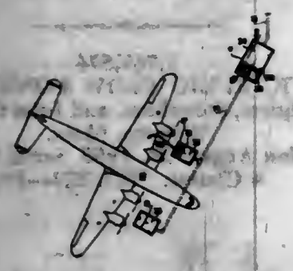
---

2,769,574
**AUTOMATIC FLUID FLOW CONTROL DEVICE**
Paul J. Algiers, Stoneham, and John O. Kercheval, Woburn, Mass.
Application August 26, 1955, Serial No. 530,751
4 Claims. (Cl. 222—59)

4. An automatic fluid flow control device comprising a cylindrical housing having oppositely-disposed outlet and inlet pipes projecting from the periphery thereof, a horizontally-disposed drive shaft rotatably supported in said housing and having one end projecting therefrom, a

paddle wheel positioned within said housing and carried by said shaft for rotation therewith in response to the flow of fluid admitted through said inlet pipe, a gate valve arranged transversely of and closing said inlet pipe intermediate the ends thereof and connected to said inlet pipe for movement from the closing position to a position in which said inlet pipe is open, and a time-settable control-operating device operatively connected to the projecting end of said drive shaft and to said gate valve, said device including a driven shaft positioned adjacent said drive shaft and connected to the latter for movement therewith, a control-operating element carried by said driven shaft, an actuating member having a time-setting element positioned so that the time-setting element is normally adjacent to and out of engagement with said control-operating element and movable from the position in which the time-setting element is out of engagement with said control-operating element to any selected position of driving engagement with said control-operating element, a latching element pivotally carried by said actuating member and engageable with means on said gate valve when the latter is in its closing position and releasable from said means upon initiation of the movement of said actuating member from the position in which the time-setting element is shifted from its position of out of engagement with said control-operating element to any selective position of driving engagement with said control-operating element and move said gate valve to its position in which the inlet pipe is open, spring means operatively connected to said gate valve for biasing the latter to its closed position, a releasable swingably supported holding element arranged in the path of movement of said gate valve and engageable with said valve when the valve has been moved to its open position to hold it in the latter position, and means carried by said actuating member and engageable with said holding element upon movement of said actuating member from the position in which said time-setting element is released from driving engagement with said control-operating element to release said holding element from engagement with said gate valve and permit said gate valve to return to its closing position under the action of said spring means.

---



2,769,575

**AIRPLANE REFUELING SYSTEM WITH RATE OF FLOW METERING**

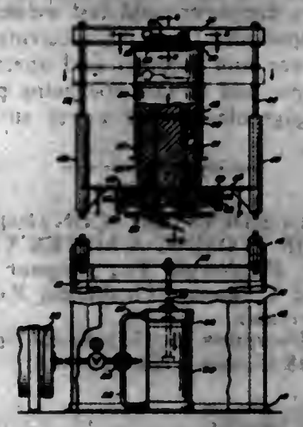
Gerald Jerome Herman, Beverly Hills, Harwood D. Hosher, Sunland, and Robert T. Rummel, Burbank, Calif., assignors to Lockheed Air Terminal, Inc., Burbank, Calif.

Application December 6, 1952, Serial No. 324,582

1 Claim. (Cl. 222—71)

An underground aircraft refueling system for airplanes comprising a first pit, a fuel supply pipe leading into the first pit, second and third pits spaced from the first pit and from one another, a fuel line leading from the first pit to the second and third pits, hose reels in the second and third pits, hoses wound on the reels and provided with valved fuel dispensing nozzles, the hoses being adapted to be unreeled for extension from the second and third pits so as to supply fuel to the aircraft, meters in the first pit manifolded in parallel relation between said fuel supply pipe and said fuel line, power driven means in the second and third pits for rotating their respective reels to receive the respective hoses, cover means for the pits, the cover means for the first pit including an access door adapted to be raised, a self closing valve in the first pit for controlling the flow of fuel through said supply pipe, means actuated by the door upon moving the same to the closed position for closing said valve, the cover means for the second and third pits including access doors adapted to be raised so that said hoses may be withdrawn from said pits, treadle means for switching on said power driven means, and means for switching off said power driven means when said access doors for said second and third pits are closed.

---



2,769,576

**DISPENSER FOR TILE LAYING CEMENT AND SIMILAR MATERIALS**

Frank L. Stevens, Lexington, Mass., assignor to W. F. Webster Cement Company, Cambridge, Mass., a voluntary association of Massachusetts

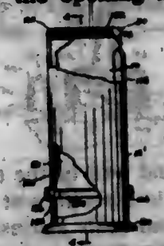
Application September 25, 1953, Serial No. 382,283

5 Claims. (Cl. 222—80)

1. Apparatus for dispensing highly viscous material from a cylindrical container open at one end and closed at the other end, said apparatus comprising a hollow dispensing cylinder of slightly less external diameter than said container providing a substantially cylindrical dispensing chamber, said chamber having a length and volume at least approximating that of said container, and being adapted to be initially filled with said material, a fixed mounting supporting said cylinder upright at a predetermined location, said cylinder having a circumferential opening into said chamber at its upper end and a plurality of relatively short dispensing nozzles mutually spaced from each other by predetermined intervals opening directly from said chamber at its lower end, said cylinder further having a circumferential circular external sealing flange about said circumferential opening adapted to enter said container and to fit the internal wall thereof with a sealing fit, a forcing member mounted above said circumferential opening, said member being adapted to engage the closed end of said container, mechanism for forcing said member downwardly toward said cylinder thereby to force the wall of said container over said flange and to discharge material from said container through said circumferential opening into said chamber while simultaneously extruding material from said chamber through said nozzles.

---

2,769,577



**BAG CONTENT DISPENSER**

Bernhardt Stallman, Omaha, Nebr.

Application April 21, 1950, Serial No. 157,209

7 Claims. (Cl. 222—399)

1. A device for dispensing the contents of a flexible bag having an opening therein comprising: an outer housing having two hollow portions disposed opposite each other for receiving said bag therein, at least one of said portions having a rough surface disposed opposite the other of said portions for receiving against said rough surface one end of said bag, one of said housing portions having another rough surface disposed spaced apart from said first rough surface and opposite the other portion of said housing for receiving therebetween the other end of said bag, securing means pivotally attaching said housing portions together for the opening apart thereof; a clasp

removably securing said portions in closed position; means attached to said housing for holding and supporting said bag at one of its ends; a member slidably secured to said housing for movement between said rough surfaces, said member having a slot for receiving the other end of said bag, said member having a knob disposed extending outwardly of said housing; and means attached to said housing for maintaining the walls of said bag opening in closed position.

2,769,578

**PLASTIC CEMENT APPLICATOR**

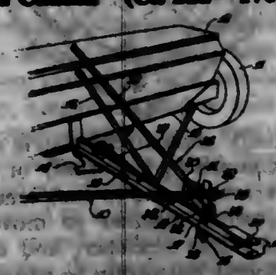
John Johnson, San Francisco, Calif.

Application December 12, 1955, Serial No. 552,351

3 Claims. (Cl. 222—107)

3. In a new article of manufacture, a plastic cement applicator comprising a rectangular envelope of flexible plastic material having an open end folded diagonally upon itself from one corner thereof, with said open end matching an adjacent side edge of said envelope and forming a pointed spout aligned with said side edge; a plurality of slanted and graduated indicia on the apex of said pointed spout; and a transparent adhesive strip mounted around said pointed spout, and around said folded corner and sealing said folded corner flatly against said envelope.

---



2,769,579

**IMPLEMENT ADJUSTING DEVICE**

David M. Morris, Richmond, Ind., assignor to International Harvester Company, a corporation of New Jersey

Application March 30, 1954, Serial No. 419,782

12 Claims. (Cl. 222—176)

1. In agricultural distributors and the like having a supporting frame including a hitch frame for connection to a tractive vehicle, and a hopper extending upwardly from the frame having discharge openings therein and closure means for regulating the flow of material, an actuating member associated with the hopper for operating the closure means, a rocker pivotally mounted on the hitch frame operatively connected to said actuating member for operating the latter upon rocking the rocker, an elongated lever pivotally mounted on said hitch frame for swinging in the same direction as and relative to the rocker, abutment means on the lever engageable with the rocker in one direction of movement of the lever, and means providing lost motion connecting the lever to said rocker to limit the relative movement of the lever in the other direction.

2,769,580

**COMPRESSION SPRAYER**

Robert C. Hudson, Glencoe, Ill., and August H. Plake, Hastings, Minn., assignors to H. D. Hudson Manufacturing Company, Chicago, Ill., a corporation of Minnesota

Application June 19, 1953, Serial No. 362,914

6 Claims. (Cl. 222—397)

3. In a compression sprayer having a tank for a spray solution and provided with a constricted filler opening and an enlargement at the top providing a funnel for facilitating supplying the tank with the solution to be sprayed, a pump having a barrel adapted to be detachably mounted in the filler opening for supplying the tank with sufficient air pressure to permit continuous spraying over an extended period of time, said enlargement having spaced inturned flanges providing inclined camming surfaces and said pump having a cover provided with spaced arms each having an inclined camming surface adapted to be received beneath the camming surfaces on said enlargement and when rotated in one direction locating the pump barrel in the filler opening and sealing the interior of the tank to permit the pump to build up air pressure in the tank, and when moved in the opposite direction disengaging the camming surfaces and permitting removal of the pump and its barrel from the tank, said barrel having an external flange and sealing means carried by the flange at the upper open end of the barrel, the barrel being of maximum diameter below said flange and thereat conformably received within the filler opening and provided with a tapered constriction beneath said portion of maximum diameter for relieving entrapped pressure in the tank about said constriction as the barrel is elevated by the entrapped pressure in the tank and before the camming surfaces are disengaged, and an abutment on one or more of said camming surfaces for preventing disengagement of the camming surfaces until pressure is relieved in the tank.

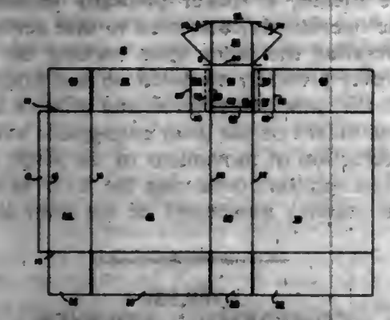
2,769,581

**CONTAINERS, CONTAINER BLANKS AND METHOD OF MAKING SAME**

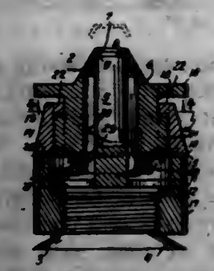


George H. Lagemann, Mundelein, Ill., assignor, by direct and mesne assignments, of nine-tenths to Custom Designers, Mundelein, Ill., a partnership, and one-tenth to Arthur James Wagner

Application March 20, 1953, Serial No. 343,543

9 Claims. (Cl. 222—455)

1. In a container, a pocket member formed from a vertically an extended portion of an end wall and disposed within said container, said pocket member having an open side positioned in acute angular relation with an inner wall of said container so as to provide direct communica-



tion of the pocket with the interior of said container, and aperture forming means for placing an aperture in said wall above said pocket opening comprising spaced slit lines extending along three sides of a given section of said

wall and a creased line extending along the fourth side thereof to permit depression of the section about the creased line into said pocket opening to divide same into two communicating compartments.

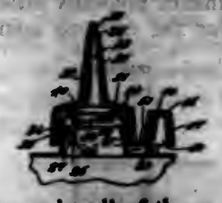
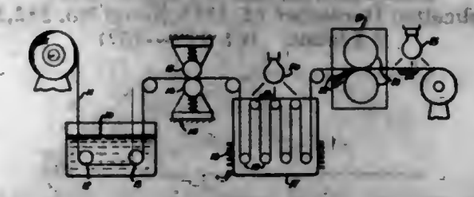
2,769,582
CLOSURE MECHANISM FOR CONTAINERS
Theodore F. Schlichtapp, Long Island City, N. Y.
Application September 14, 1953, Serial No. 379,860
6 Claims. (Cl. 222—513)



6. In a discharge mechanism for containers, a body member constructed to be attached to the container, a post-like member fixed at its inner end to said body member, a manually movable spout member projecting from a bore in said body member, said spout member surrounding said post and forming therewith an annular passage for the material to be discharged, cooperating valve and valve seat members on said respective post and spout members arranged to control a discharge aperture at the outer end of said spout member, spring means arranged to urge said spout member to open position, cooperating cam formations on said spout and body members respectively to effect axial shifting of said spout member to an inner position to close said discharge aperture and to an outer position to open said discharge aperture when said spout member is manually rotated, an annular diaphragm fixed at its outer periphery to said body member, and means including said spring means for maintaining the inner margin of said diaphragm in sealing engagement with said spout member, so as to prevent the escape of vaporized material from the interior of the container.

---

2,769,583
CLOSURE
Henry S. Darlington, Jr., Media, Pa., assignor to A. H. Wirz, Inc., Chester, Pa., a corporation of Pennsylvania
Application May 12, 1954, Serial No. 429,251
4 Claims. (Cl. 222—541)



1. In a container including a neck provided with an external annular neck bead, an external annular recess behind the neck bead, an end opening in the neck and an end wall on the neck beyond the neck bead, the invention which comprises an integral elastomer closure comprising an end wall positioned beyond and in spaced relation to the end wall of the neck and adapted to close the opening in the neck, an annular flange extending around the outside of the neck, having an internal annular rib on the flange which engages firmly immediately behind the external bead on the neck, and having an integral elastic diaphragm extending from the inside of the end wall in a direction diagonal to the axis of the flange in repose of the closure, occupying the space between the end wall of

the closure and the end wall of the neck, displaced by the end wall of the neck to a position at which the diaphragm engages diagonally and seals against the end wall of the neck, the angle of the diaphragm to the axis in sealing position being between 75 and 90 degrees, the diaphragm being compressed against the end wall of the neck when the rib on the inside of the flange engages immediately behind the bead on the neck ring.

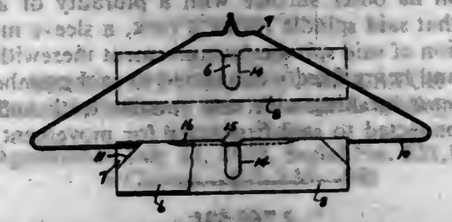
2,769,584
METHOD OF PERMANENTLY PLEATING FABRICS
Martin Zinamon, Jackson Heights, Edward F. Semlitz, Fresh Meadows, and Jordan Levin, Brooklyn, N. Y.
Application February 9, 1954, Serial No. 409,162
6 Claims. (Cl. 223—30)

1. A method of permanently pleating and creasing an indivisible rolled length of fabric containing natural fibres in one continuously moving operation, said method comprising subjecting a soft starchless and creaseless fabric to a hot aqueous solution of a formaldehyde resin containing a catalyst, mangling the fabric, heating the fabric, forming permanent pleats in the fabric after heating and while it retains about 5 to 10% moisture, and then curing the fabric.

---

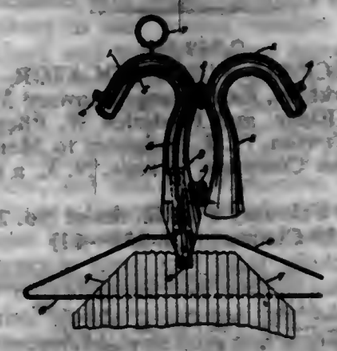
2,769,585
COLLAR STRETCHER
Abraham Goldstein, Brooklyn, N. Y.
Application January 4, 1955, Serial No. 479,767
6 Claims. (Cl. 223—52.1)



1. A substantially annular expansible and contractible collar stretcher comprising a plurality of substantially arcuate segments arranged end-to-end, tension spring connecting said segments together to move the same inwardly to contract said stretcher, and cams means for moving said segments outwardly to expand the stretcher comprising a rotary plate within the confines of said segments, internal slots in said segments in which said

plate is rotatable, peripheral cams on said plate rotatable in said slots by said plate, and means in said slots engaged by said cams to cam said segments outwardly in opposition to said springs.

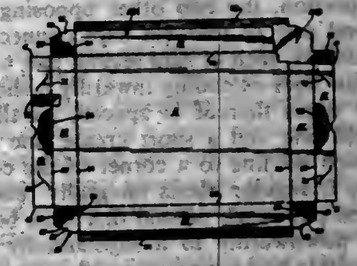
---



2,769,586
HANGERS FOR TROUSERS
John D. Lee, Freeport, Pa.
Application May 5, 1954, Serial No. 427,751
1 Claim. (Cl. 223—95)

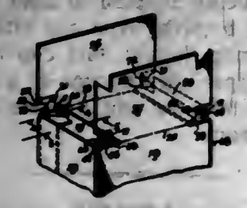
An attachment for a garment hanger having a horizontally extending portion to receive the attachment, comprising a trousers suspension member constructed of an integral sheet of tough stiff material, said member folded along three parallel lines extending in the longitudinal direction to form a pair of downwardly disposed supporting panels and a pair of upwardly disposed attaching panels, said panels being oblong rectangularly-shaped and uniform in length and width, said supporting panels positioned flatly against each other and joined together at the tops thereof along the center fold line, said attaching panels positioned flatly against the outer face of respective supporting panels and having the bottoms thereof joined with the bottoms of respective supporting panels, the joined top of the supporting panels being provided with a longitudinally extending slot for receiving and attaching the garment hanger with said member, each of said attaching panels provided with a centrally disposed transversely extending recess opening at the free top thereof, and reinforcing means engaged near the juncture of each of said attaching panels and the adjacent supporting panel for holding said panels flatly against each other.

---



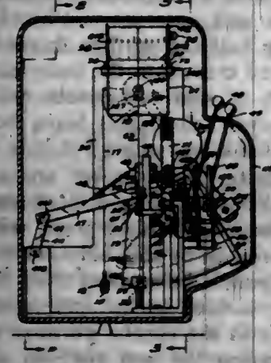
2,769,587
CASE TYPE HOOK FOR SUIT HANGERS
Clay La Fayette Thrasher, Atlanta, Ga.
Application December 15, 1954, Serial No. 475,506
1 Claim. (Cl. 224—45)

A case-type hook of the character described comprising two similar parts shaped as a hook, each part having a curved bill portion extending in a substantially straight elongated portion, hinges attached to said parts for holding them swingably together, each part being round in cross section and being hollow when they are folded together with the edges of the parts in register with each other, a ring attached in fixed condition in one of the case parts in its upper curved portion, said ring being adapted for use in supporting the hook portions of a plurality of wire type suit hangers with the case hook when it is in its closed condition with the shanks of the suit hangers encased within the substantially straight portion of the case hook; a second ring attached swingably to the outer top face of the case part having the other ring therein; a latch in two parts with one part thereof mounted on each case part, said latch being adapted to hold the case hook in closed condition; a spring type clip attached to the case part having the ring therein, said clip being adapted for supporting the upper edge portion of a suit carrying bag when it encloses suits on suit hangers supported by the ring in the case part.



---

2,769,588
ORNAMENTAL BOX
Anita E. Beck, Minneapolis, Minn.
Application September 15, 1952, Serial No. 309,690
3 Claims. (Cl. 229—31)

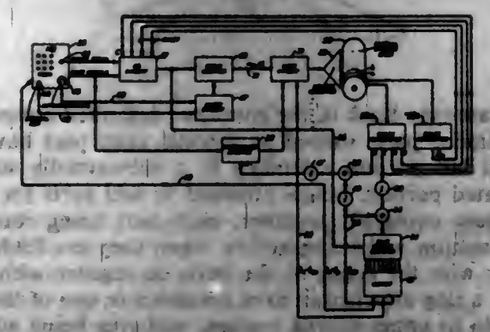


1. An article of merchandise comprising members adapted to be folded to form one part of a bipartite telescoping box having in combination, a blank of rather stiff sheet material, a loose cover of lighter sheet material therefor, said blank comprising a rectangular main body panel having end panels disposed at opposite ends thereof, score lines at the junction of said body panels and end panels, said body panel having side panels disposed at opposite sides thereof, score lines at the junction of said body panel and side panels, a pair of gores joining each end of said end panels to the end of adjacent side panels and disposed between the ends of said side and end panels, said gores having incisions therein extending from the corners of said main body panel outwardly to substantially the center of said gores and creases extending from said incisions outwardly to the outer edge of said gores, said end panels having extension panels contiguous therewith, said cover overlying said blank and having a central body panel coextensive with said body panel of said blank and having end panels and extension panels coincident with the end panels, gores and extension panels of said blank, said cover having side panels of the same length as the side panels of said blank and extending a short distance beyond said latter side panels, the extension panels of said blank and cover having their adjacent surfaces secured together, said extension panels of said blank having areas of adhesive thereon at the side opposite said cover and disposed adjacent the center of said side panels, said gores on said blank having adhesive on substantially half the surface thereof extending from said incisions and creases to the outer edges of said gores and to the ends of said end panels, said projecting portions of said cover side panels being bent over the side panels of said blank and secured thereto by said adhesive, said side panels of said member and cover being bent over the central portion of said blank and the end panels thereon, the portions of said gores with said adhesive thereon being secured by said adhesive to said end panels, said extension panels being bent over the end panels of said blank and secured to the end panels of said blank by said adhesive at the central portions of said extension panels, thus leaving the end portions of said extension panels free, whereby a collapsed container is formed the sides and the ends of which can be lifted to form a rectangular box.

2,769,589
**CLOSURE CONSTRUCTION FOR CONTAINERS**
George Arlington Moore, New York, N. Y.
Application May 12, 1954, Serial No. 429,232
3 Claims. (Cl. 229—37)

1. A closure for rectangular containers having four side walls arranged in opposing pairs, two opposing side walls having a first pair of substantially like, foldable flaps, each of said flaps being divided along a hinge line into two foldable marginal portions with an inner portion hinged to the outer portion, the two other opposing side walls having a second pair of foldable flaps connected thereto along flap fold lines, each of said second pair of flaps having a pair of slit lines extending inwardly a short distance from the side edges thereof in spaced, parallel relation to the flap fold line and a short crease line connecting each end of each slit line to a corner of the container to define foldable triangular pleats integrally related with a flap of said first pair, each of said first flaps being folded inwardly and downwardly to a substantially horizontal position, said pleats being superimposed upon said second flaps, each of the outer-most marginal portions of said first flaps being provided with a pair of opposed open notches cut inwardly of the side edges thereof with an edge of each notch being parallel to and spaced outwardly of the dividing line of said first flaps, each said outer-most marginal portion being folded upwardly, outwardly and downwardly in self-superimposing relationship upon the inner-most marginal portion, the free side edge portions of each marginal portion being disposed in abutment upon an adjacent side wall of the container, said parallel edge of each notch being positioned in the same plane as the slit edge of a pleat, each of said second flaps being folded inwardly and downwardly in overlapping container closing relationship, the outer edge of the first folded of said second flaps being provided with a pair of open notches having edges that coincide with one notch in each of said outer-most marginal portions and the pair of pleats in the other of said second flaps being morticed into said pair of coinciding notches.

2,769,590
**ADJUSTING MECHANISM FOR WEIGHING SCALES**
Ernst Kubale, Balingen, Germany
Application December 12, 1951, Serial No. 261,215
Claims priority, application Germany December 18, 1950
4 Claims. (Cl. 235—61)

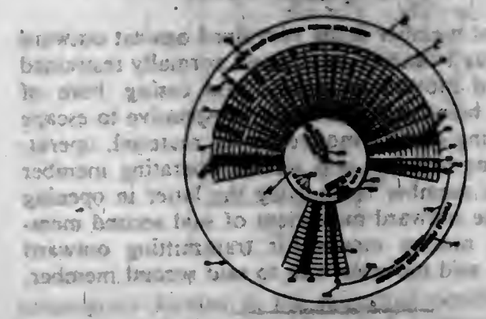


1. Apparatus for adjusting the location of a price indicating means for weighing scales, comprising, in combination, a member adapted to be connected to the price indicating means so as to move with the same; first and second levers; first moving means interconnecting said first lever and said member for moving the latter a predetermined distance for a given movement of said first lever; and second moving means interconnecting said second lever and said member for moving the latter a fraction of said predetermined distance for a movement of said second lever of the same magnitude as said given movement, said first moving means comprising a stationary cylindrical bar, a hollow cylindrical spindle mounted on said bar for sliding movement therealong and being formed on its outer surface with a plurality of annular teeth so that said spindle forms a rack, a sleeve mounted on a portion of said spindle for movement therewith along said bar and being fixedly connected to said member, and a gear sector meshing with said annular teeth and being fixedly connected to said first lever for movement therewith.

2,769,591
**INTEGRATING MECHANISM**
Paul Zamboni, Zurich, Switzerland, assignor to Landis & Gyr A. G., Zug, Switzerland, a body cooperate of Switzerland
Application September 23, 1954, Serial No. 457,847
7 Claims. (Cl. 235—61)

1. In a mechanical integrating instrument the combination of a pawl carrier rotating at a constant velocity, a movable pawl on the carrier, an adjustable disk, means for adjusting said disk in accordance with the instantaneous value of the quantity to be measured, a ratchet rotatably secured to a counter, and adjustable stop members for moving the pawl into and out of engagement with the ratchet, one of said stop members being movable with the adjustable disk so as to vary the period of engagement between the pawl and ratchet, and means for pivoting said one stop member to a non-engaging position through a portion of the disk's travel whereby engagement between the pawl and ratchet is avoided.

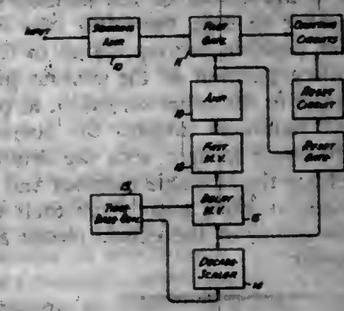
2,769,592
**DECIMAL POINT LOCATOR**
William H. Burkhart, East Orange, Howard M. Fleming, Jr., Basking Ridge, and Frederick W. Pfleger, Pahlisakill Lake, Newton, N. J., assignors to Monroe Calculating Machine Company, Orange, N. J., a corporation of Delaware
Application February 9 1952, Serial No. 270,876
29 Claims. (Cl. 235—61)



14. In a decimal point aligning arrangement for a computer or the like, the combination of a storage device in which digit signals are recorded seriatim, normally

disabled means for precessing recorded digits a predetermined amount, enabled in conjunction with each new digit signal recording, a counter arranged to count through a predetermined number of counts, said counter being advanced one step for each digit on one side of the decimal point of the number of which the digits are a part, and means for advancing said counter through the remainder of said predetermined number of counts after the last digit on said one side of the decimal point has been entered and for precessing digit recordings one digit space for each step of said advance.

2,769,593
**FERTILITY PERIOD INDICATOR**
Louis L. Safranek and Kenneth A. Ohlinger, Omaha, Nebr.
Application July 11, 1955, Serial No. 521,125
3 Claims. (Cl. 235—88)



1. A fertility period indicator comprising: a low member having a pivot point, approximately adjacent an area-center of said lower member, said lower member having the day numbers of the days of a year on an upper side thereof and arranged in radially extending columns and also arranged in rows concentric with and extending various distances outwardly from said pivot point, a center member disposed above said lower member and having a first window therethrough disposed above and for exposing certain ones of said day numbers on said lower member, said center member having a pivot-point above the pivot point of said lower member, said center member having month markings thereon adjacent said first window and respectively arranged in positions opposite corresponding ones of said concentric rows, said center member having a second window therethrough and of a shape for exposing one of said columns, said second window being adjacent said month markings for the reading of day numbers in said second window opposite said month markings, said second window being in a position for indicating the first date of a period in which the days of actual fertility lie, said center member having a third window therethrough of a shape for exposing another of said columns different from that column exposed by said second window, and said center member having month markings thereon adjacent said third window and respectively arranged in positions opposite corresponding ones of said concentric rows, said third window being in a position for indicating the last date of said period, said center member having a circular row of day numbers thereon for indicating cycle days and arranged concentric with said pivot-point, and a top member disposed above and having a smaller size than said center member for not unduly overlaying said windows, said top member having a pivot-point above the pivot-points of said lower and center members, said top member having a window therethrough for exposing and indicating one of the days in said circular row of cycle days, said top member also having an indicia thereon adjacent an edge thereof and disposable opposite said columns and for indicating one of said columns of day numbers on said lower member, and means for pivotally securing said members together at their pivot points for independent rotation.

2,769,594
**DUAL SELECTIVE REGISTERS**
James Edward Dimmett, Pittsburgh, Pa., assignor to Rockwell Manufacturing Company, Pittsburgh, Pa., a corporation of Pennsylvania
Application September 17, 1952, Serial No. 310,023
21 Claims. (Cl. 235—91)

1. In an indicating mechanism including a flow meter through which fluid is continuously passed, a meter housing and a drive shaft extending through said housing; the combination comprising a drive selector housing mounted on said meter housing and surrounding said drive shaft, a pair of spaced apart alternately selectively driven members mounted in said selector housing extending exteriorly of said selector housing at one side, a ring adapter removably secured upon and upstanding from said selector housing surrounding one of said driven members, a first indicator mounted on said ring adapter and operatively connected to said one of said driven members whereby motion of the driven member is transmitted to said indicator, an elongated extension mounted at one end on said selector housing, a second indicator mounted on the other end of said extension and operatively connected to the other of said driven members through said extension whereby said second indicator is at a greater elevation than the first indicator to permit unobstructed reading and servicing of both of said indicators from the same side and movable selector means in said housing for optionally engaging said drive shaft with a selected indicator through a respective driven member.

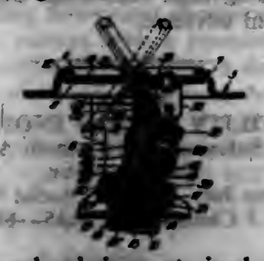
2,769,595
**FREQUENCY COUNTER**
Alan S. Bagley, Los Altos, Calif., assignor to Hewlett-Packard Company, Palo Alto, Calif., a corporation of California
Application July 23, 1952, Serial No. 300,447
9 Claims. (Cl. 235—92)

1. A frequency counter comprising pulse counting means, an electronic gate serving to control application of pulses to the counting means, means for supplying pulses to the gate at a frequency corresponding to the unknown frequency, a time base generator for generating at least two first and second timing pulses separated by a predetermined period, said period corresponding to a desired counting time, and means responsive to said pulses serving to cause opening and closing of said gate and resetting of the counting means, said last means including means for imposing a predetermined time delay

between resetting of said counting means and the opening of said gate responsive to the first pulse and for imposing a like time delay between the second pulse and closing of said gate.

---

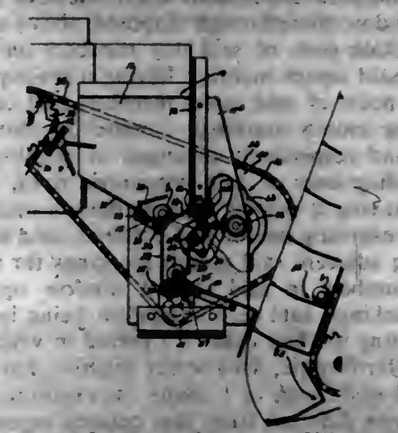
2,769,596
REGISTER RESETTING MEANS
Paul Locoli, Geneva, Switzerland, assignor to Sodeco, Societe des Compteurs de Geneve, Geneva, Switzerland, a firm of Switzerland
Application February 18, 1955, Serial No. 489,191
Claims priority, application Switzerland December 30, 1954
3 Claims. (Cl. 235—144)



1. An impulse meter comprising a casing, a system of coaxial digit-carrying drums revolubly carried inside the casing, a gear system including coaxial pinions adapted for a predetermined position of their axis with reference to the axis of the drums to control the relative rotary movement of the drums for the transfer of digit values between the successive drums, a common rockable member adapted to pivot round an axis parallel with the axis of the drums and revolubly carrying the different coaxial pinions along an axis parallel with the pivotal axis of the rockable member, said rockable member being adapted for a predetermined angular position round its pivotal axis to set the transfer pinions in their operative drum-controlling position, elastic means urging said rockable member away from said predetermined angular position, means controlling the rotation of the input unit drum of the drum system, a return-to-zero cam coaxially rigid with each drum, a support adapted to rock round an axis parallel with that of the drums, a plurality of hammers corresponding to the different cams, carried by said support and the outer ends of which project each between the corresponding cam and the rockable member, and means adapted to shift the support into opposite directions of rotation to produce, when the support is shifted in one direction, a movement of the hammers towards the rockable member to urge the latter into the above mentioned angular position corresponding to the operative drum-controlling position of the pinions and, when the support is shifted in the other direction, to produce a movement of said hammers towards the corresponding cams to return the latter to zero with the drums and to simultaneously release the rockable member and to thereby allow the pinions to move away from their operative position under the action of the elastic means acting on the rockable member.

---

2,769,597
THERMOSTATIC VALVE WITH SOLID ACTUATOR MEMBER
Edward L. Mayo, Cleveland, Ohio, assignor to The Bishop & Babcock Manufacturing Company, Cleveland, Ohio, a corporation of Ohio
Application June 27, 1955, Serial No. 518,129
14 Claims. (Cl. 236—34)

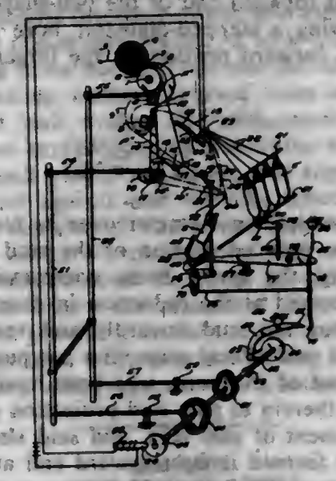


1. In thermostatic valve means, a valve seat member, a valve member cooperating with said seat member movable in one direction to a first and normal open position and in the opposite direction to a closed position, said valve member also being movable in said opposite direction beyond said closed position to a second and abnormal open position upon failure of said valve means, means yieldingly urging said valve member in said opposite direction, a sealed casing carried by said valve seat member and having a movable wall, a body of motive power material in said casing expansible and contractible responsive to variations in temperature, a first operating member and a second operating member slidably connected and having limited movement one toward the

other, said first member being restrained against outward movement away from said casing and normally restrained against inward movement toward said casing, both of said members being movable inward responsive to escape from said casing of said motive power material, operating connections between said second operating member and said valve member for moving the latter in opening direction in the outward movement of said second member, and lost motion means for transmitting outward pressure from said movable wall to said second member.

---

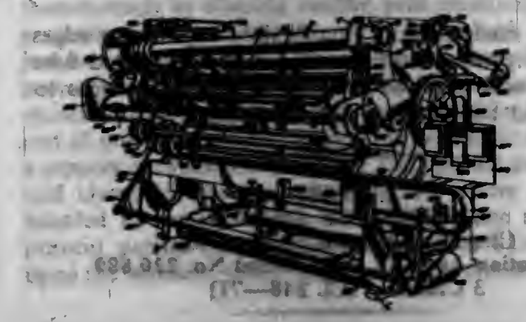
2,769,598
MACHINE FOR OPERATING UPON BOBBINS
Russell P. Drake, Caledonia, Robert E. Borchardt, Rockford, and Charles R. Crandall, Loves Park, Ill., assignors to Barber-Colman Company, Rockford, Ill., a corporation of Illinois
Application September 11, 1952, Serial No. 309,122
11 Claims. (Cl. 242—35.5)



1. An apparatus for operating upon filling wound bobbins comprising, in combination, means for rotating a bobbin in a direction to unwrap a strand of yarn wound upon its butt end, a pair of rolls disposed below said bobbin rotating means and having intermeshing teeth, and continuously operating means to exert a force other than gravity on the unwrapping strand to draw the same away from the bobbin and present it to said rolls to cut or break off the strand from the bobbin.

---

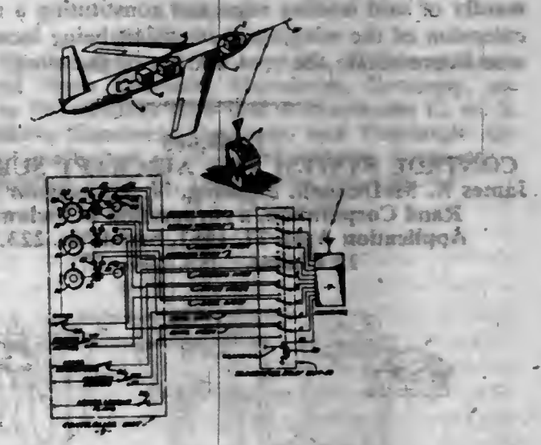
2,769,599
THREAD TRANSPORTING MECHANISM
Stefan First, M. Gladbach, Rhineland, Germany, assignor to Walter Reiners, Waldniel, Lower Rhine, Germany
Application September 5, 1952, Serial No. 308,833
Claims priority, application Germany September 7, 1951
11 Claims. (Cl. 242—35.6)



1. A thread transporting mechanism comprising, in combination, guide means for guiding thread from a supply spool along a predetermined course; a support; first suction means turnably mounted on said support for turning movement along a predetermined path from a rest position to a pick-up position adjacent said course for sucking at the latter position and end portion of a broken thread and bringing the same to said rest position; an automatic knotting mechanism located adjacent to said rest position of said first suction means to knot a thread end portion picked up thereby to an end portion of another thread; second suction means for holding the thread end portions of a plurality of supply spools adapted to be

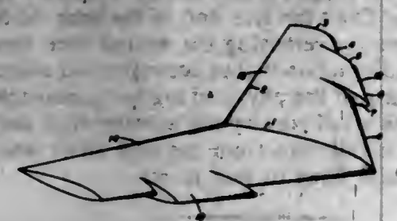
successively located in the operating position of an exhausted supply spool, said second suction means being located with respect to said operating position along a line which intersects said path of movement of said first suction means so that a thread end portion of a supply spool newly located in said operating position crosses said path of movement of said first suction means; and an extension mounted on said first suction means for hooking an end portion of the thread of a supply spool newly located at said operating position to move said thread end portion from said second suction means and supply spool to said knotting mechanism.

---



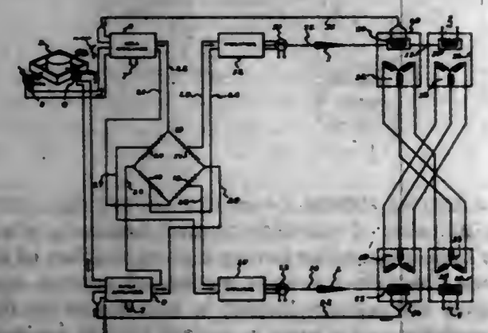
2,769,600
WEB WINDING MACHINE
Edwin M. Kwitek and Ernst Daniel Nystrand, Green Bay, Wis., assignors to Paper Converting Machine Co., Inc., Green Bay, Wis., a corporation of Wisconsin
Application July 16, 1952, Serial No. 299,108
10 Claims. (Cl. 242—56)

1. In a web winding machine, a frame, a turret rotatably mounted within said frame adjacent one end thereof, driving means continuously driven and adapted to rotate said turret intermittently, a plurality of elongated core shafts fixed at one end to said turret at points equally spaced about an arc having its center on the rotational axis of said turret and having free ends projecting inwardly from said turret in substantially parallel relation, each of said core shafts being adapted to receive at one position of the turret an elongated tubular core, support means carried by said frame and movable into engagement with the free end of a core shaft at selected positions thereof to support the same, locking fingers carried by each core shaft for gripping a core positioned thereon to prevent rotational movement thereof relative thereto and being actuated by said last-mentioned means, means for winding a web upon the core of a core shaft while the free end thereof is supported, means for withdrawing said support member from the free end of the core shaft, and automatic means for removing the wound core from the core shaft including a continuous conveyor and a laterally-extending lug carried thereby, said lug being movable into engagement with a full core by the movement of said conveyor to move a full core from the core shaft while the core shaft remains fixed to said turret.



---

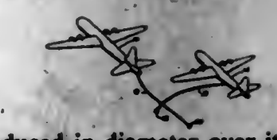
2,769,601
AUTOMATIC RADIO CONTROL SYSTEM
Jacob J. Hagopian, Los Angeles, and Stuart R. Hennies, Manhattan Beach, Calif., assignors to Northrop Aircraft, Inc., Hawthorne, Calif., a corporation of California
Application August 18, 1950, Serial No. 180,367
25 Claims. (Cl. 244—14)



1. In a remote control system for controlling a device having a plurality of movable control members, wherein a remote radio transmitter having a given number of fixed modulation channels transmits modulated control signals to a receiver and selector located in said device for filtering and applying said signals to control circuits connected to operate said control members; means for individually controlling more control circuits than available channels, which comprise transfer means connected to be momentarily energized by a signal in a first one of said channels, a first group of said control circuits connected respectively to the outputs of the remainder of said channels by said transfer means when said transfer means is de-energized, a second group of said control circuits connected respectively to the outputs of said remainder of channels by said transfer means when said transfer means is energized, a plurality of primary manual control members respectively connected to switch on and off any of said remainder of modulation channels only, a plurality of auxiliary manual control members, each having means for completing an electrical circuit, and automatically timed actuating means connected to operate in response to completion of each of said electrical circuits, each of said actuating means comprising means for switching on said first channel to energize said transfer means, means for switching on a corresponding one of said remainder of channels while said first channel is still on, means for switching off said corresponding one of said remainder of channels after a predetermined time interval and while said first channel is still on, and means for switching off said first channel after a second predetermined time interval, to de-energize said transfer means.

2,769,602
**AIRPLANE WING WITH STABILIZING LEADING-EDGE CHORD-EXTENSIONS**
George Chester Furlong, Newport News, Va.
Application July 24, 1952, Serial No. 300,791
9 Claims. (Cl. 244—40)
(Granted under Title 35, U. S. Code (1952), sec. 266)

1. A wing having upper and lower surfaces together with a trailing and a leading edge, the wing being of swept formation which in flight exhibits a vortex type of flow separation producing large shifts in aerodynamic center well below maximum lift, and means connected with the wing for diffusing said vortex flow thereby preventing the large shifts in aerodynamic center, including a continuous partial span leading edge extension projecting forwardly of said leading edge and constituting a chordwise extension of the wing, said extension being located spanwise intermediate the root and tip of the wing.

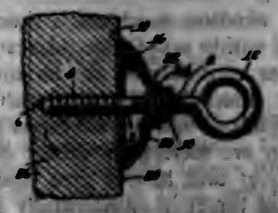


2,769,603
**CONTROL SYSTEM FOR AIRCRAFT SURFACES**
James A. McDonnell, Flushing, N. Y., assignor to Sperry Rand Corporation, a corporation of Delaware
Application April 27, 1951, Serial No. 223,353
10 Claims. (Cl. 244—77)

2. In a control system for aircraft having a pair of control surfaces adapted to move said aircraft about two craft axes, the combination therewith of a first servo mechanism for operating the first of said surfaces, a second servo mechanism for operating the second of said surfaces, first and second sources of control signal for controlling both servo mechanisms in the same and opposite senses respectively, signal generators having their outputs connected in feedback fashion to oppose respectively the signals supplied by said first and second sources and means responsive to the outputs of both servo mechanisms for controlling the signal output from each of said generators.

2,769,604
**AIRCRAFT FLIGHT REFUELING APPARATUS**
Verne L. Hudson, Wichita, Kans., and James M. Wickham, Seattle, Wash.; said Hudson assignor to Boeing Airplane Company, Wichita, Kans., a corporation of Delaware
Application April 3, 1950, Serial No. 153,533
1 Claim. (Cl. 244—135)

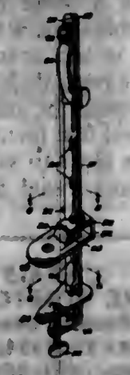
In aircraft interconnecting apparatus, a dragline adapted to trail from one aircraft for contact by another aircraft, a dragline stabilizer element comprising a rearwardly divergent generally bell-shaped member on the trailing end of said dragline and having an axis of symmetry substantially coincident with the adjacent portion of the dragline, and coupling means carried by the trailing end of the dragline, forming a quickly disengageable connection between the dragline and the stabilizer element, and comprising stud means projecting rearwardly of the dragline and having a reduced-diameter elongated end portion carrying a lateral projection near its terminus, a helical spring encircling said reduced end portion between said lateral projection and the shoulder of the stud at its change of cross-section, a central sleeve carried by the smaller and forward end of the bell-shaped member, said sleeve having a stepped-diameter bore slidably engageable in its forward portion by the larger portion of



the stud, and reduced in diameter over its rearward portion to pass the reduced portion of the stud while stopping said spring, the spring being compressible against the shoulder formed at the reduction in diameter of the bore by inserting the stud inwardly and rearwardly in said sleeve until said lateral projection has passed beyond the rearward end of the bore, said bore having a longitudinal groove therein to pass said projection during such insertion movement of said stud, and said sleeve further having a notch formed in its rearward end at a location offset circumferentially from said groove end to receive said lateral projection when rotated by the stud out of circumferential registry with the groove, reaction of the spring forcing the stud forwardly in relation to the sleeve and thereby holding said projection in said notch.

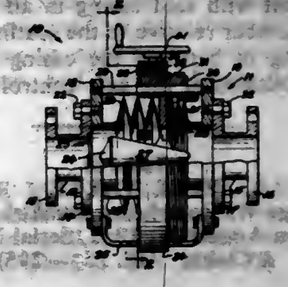
2,769,605
**STICKLESS, COLLAPSIBLE KITE**
Dorothy J. Sparkman, Cedar Rapids, Iowa
Application May 6, 1955, Serial No. 506,609
6 Claims. (Cl. 244—153)

1. A kite comprising, a thin flexible bag having edges forming the general contours of a kite, an inflated tube disposed in said bag and pressing against said edges to maintain said bag in semi-rigid condition.

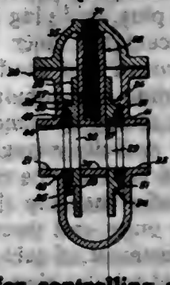


2,769,606
**ANCHORAGE DEVICE**
Charles O. Larson, Sterling, Ill.
Application April 13, 1951, Serial No. 220,880
3 Claims. (Cl. 248—71)

3. An anchorage device adapted to be installed on a wood-like support having a substantially smooth support surface comprising a lag screw, one end of said lag screw having formed thereon a wood screw portion adapted to be screwed into the wood-like support with the axis thereof substantially perpendicular to the support surface, the other end of said lag screw having an attachment member formed thereon and spaced from said wood screw portion, machine threads formed on said lag screw between said wood screw portion and said attachment member, a cup-shaped washer having an aperture in the center thereof receiving said lag screw, the free edge of said cup-shaped washer being directed toward said wood screw portion and the associated support surface, a nut threaded upon said machine threads between said attachment member and said cup-shaped washer, a lock washer mounted upon said lag screw between said nut and said cup-shaped washer, a sealing washer mounted upon said lag screw between said lock washer and said cup-shaped washer, said nut when turned upon said machine threads toward said cup-shaped washer urging the free edge of said cup-shaped washer against and into the associated support surface, said cup-shaped washer and nut and lock washer and sealing washer in cooperation with said lag screw providing a seal around the point at which said wood screw portion enters the associated support, said cup-shaped washer providing lateral support for said lag screw and in cooperation with said nut locking said lag screw against turning with respect to the associated support.



2,769,607
**FLY-TYING VISE**
Herbert L. Thompson, Elgin, Ill.
Application November 12, 1952, Serial No. 319,813
2 Claims. (Cl. 248—226)



2. A standard for a vise, said standard being generally V-shaped in cross-section and having a bottom end turned at right angles thereto, a clamp jaw having an opening therethrough to slidably receive said standard, a row of projections on the front side of said standard, said clamp jaw having a tongue adapted to engage beneath a desired projection, a flat pad member slidably mounted on said standard and a clamping screw mounted in the bottom end of said standard and adapted to fasten the standard to a support between the clamp jaw and said flat pad member, said clamp jaw having a pair of ears above the tongue adapted to loosely engage the edges of the standard to prevent partial rotation on a horizontal axis cramping upon the standard when urged in one direction.

2,769,608
**BELLOWS VALVES**
Henry J. Reisig, Bergenfield, N. J., assignor, by mesne assignments, to Hagenauer & Breyer, Inc., New York, N. Y., a corporation of New York
Application July 31, 1953, Serial No. 371,480
10 Claims. (Cl. 251—31)

1. A fluid control valve comprising rigid end sections spaced apart and forming valve ports, fluid tight flexible bellows sealed at opposite ends thereof to said end sections and forming a tubular valve body for conducting the controlled fluid between said ports, a fixed valve member on one of said end sections, a complementary movable valve member within said bellows, and positioning means located exteriorly of said bellows and having an extension extending to said movable member through and in sealed relation to walls of said bellows, said movable valve member being supported by said positioning means and being movable thereby to and from said fixed valve member to close and open the valve, said bellows being displaced with movements of said positioning means but keeping said valve body completely sealed at all times.

2,769,609
**GATE VALVE**
Heinrich Blankenagel and Peter Abis, Duisburg-Hamborn, and Hugo Eberwald, Mannheim, Germany, assignors to Thyssensche Gas- und Wasserwerke G. m. b. H., Duisburg-Hamborn, Germany, and Vereinigte Armaturen-Gesellschaft m. b. H., Mannheim, Germany
Application April 13, 1951, Serial No. 220,744
3 Claims. (Cl. 251—196)

1. A gate valve for controlling a fluid flow having a casing forming therein a valve chamber provided with two aligned conduit ports and opposed parallel valve seats, and a valve gate assemblage, this said assemblage comprising a pair of seating plates each including a flow opening and facing with one face a casing wall portion defining a respective one of the conduit ports, the opposite faces of the plates forming a guide channel therebetween extending parallel to the planes of the conduit ports, a gate control member fitted axially slidable in said channel and including a flow opening, actuating means operatively coupled with the gate control member for selective axial displacement of the latter in said channel between a position in which said flow opening is in alignment with the conduit ports and a position in which the gate control member blocks a flow of fluid through the conduit ports, the said seating plates being loosely fitted in the casing for a limited plane-parallel movement relative to the respective casing wall portions and the gate control member and guiding said control member throughout the entire axial displacement thereof, and a pair of resilient rings of substantially rectangular cross-section, each abutting with its two face-sides against the respective seating plate and the respective casing wall portion, the inner diameter of said rings defining a flow opening in alignment with the aforesaid flow openings and the seating plates and the respective casing wall portion defining therebetween an annular space of greater diameter than said rings encompassing the outer diameter of said rings to provide for an unimpeded radially inward and outward barrel-like deformation of the rings, each of said rings before assembly having a substantially greater transverse dimension than the trans-

verse dimension of said associated annular space between said seating plate and said casing wall, whereby in assembled relationship with said associated respective casing wall portions and said seating plates each said sealing ring is adapted to urge said respective seating plate into pressure engagement with said casing in all positions of the gate control member relative to the seating plates for providing a sealing fit between the casing and the seating plates in all positions of the gate control member.

---

**2,769,610**
**FUEL VALVE**
George W. Fraushaim, Dunkirk, N. Y.
Application August 31, 1951, Serial No. 244,487
1 Claim. (Cl. 251—205)

In a fuel valve, a T-shaped body formed with a tubular head and a threaded stem, external threads on one end of said head, a closure plug threaded into the opposite end of said head, an elongated tubular plug slidable in said head and having an intake port between the ends thereof adapted to communicate with said stem, an end wall on one end of said tubular plug, a jet member threaded in the other end of said plug, said plug having a longitudinal channel therein adjacent the inner or rear end thereof, a screw threaded through said head loosely engaging in said channel for holding said tubular plug against rotation while permitting sliding movement thereof, a headed plug adjusting screw swivelly engaging said end wall, a nut fixed in said head between the ends thereof, said adjusting screw threadedly engaging through said nut and having a kerf in the outer end thereof, removal of said closure plug and adjustment of said screw effecting endwise movement of said tubular plug to open or closed position.

**2,769,611**
**GAS TURBINE ROTORS AND THEIR PRODUCTION**
Paul Schwarzkopf, New York, N. Y., assignor to Schwarzkopf Development Corporation, a corporation of Maryland
Application August 15, 1951, Serial No. 242,023
2 Claims. (Cl. 253—39)

1. In an elastic fluid turbine for operation with hot combustion gases, a rotatable turbine rotor comprising a generally circular mounting member of sintered refractory particle material arranged to transmit rotary driving torque along its axis, and an array of fluid guiding members of sintered refractory particle material projecting generally radially from the periphery of said mounting member for guiding and being driven by hot gases streaming between adjacent guiding members; said mounting member having a peripheral mounting region provided with an array of junction grooves separating integral junction projections of said mounting member; each of said guiding members having a junction root fitting into one of said junction grooves; said mounting member being produced out of sintered hard powder particles to provide its said mounting region with a certain porosity and each guiding member having been produced out of sintered powder particles to provide a root with a smaller porosity than said certain porosity; said mounting member having been subjected in assembled condition to a sintering treatment wherein said mounting region has undergone a higher rate of shrinkage than said roots, and thereby causing the junction projections of said mounting region to be forced by said higher rate of shrinkage of said mounting member into clamping engagement with the roots of the guide members held between them.

---

**2,769,612**
**SHOVEL WITH LIFTING MEANS**
Charles Wehbeh, Northfield, Minn.
Application October 16, 1953, Serial No. 386,424
8 Claims. (Cl. 254—131.5)

1. A shovel having a blade portion, a shank and a handle, having in combination, a member having its upper end pivotally secured to said shank a substantial distance from said blade and having its lower portion adapted to engage a floor, pavement or other surface, a resilient member connecting said first mentioned member and said shank at a point quite close to said blade and means for limiting the movement of said first mentioned member toward said blade.

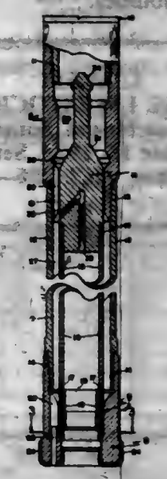
---

**2,769,613**
**WIRE STRETCHER**
Thomas J. Blodick, Beaverton, Oreg.
Application January 13, 1954, Serial No. 403,694
1 Claim. (Cl. 254—163)

A stretching device comprising a yoke adapted for adjustable mounting on a support, said yoke including a pair of spaced apart parallel arms, a driven shaft rotatably extending transversely through the arms, a winding drum mounted on the shaft between the arms, a driven gear secured to said shaft, a drive shaft rotatably mounted through the arms and spaced apart from and disposed parallel with the driven shaft, a driving gear secured to the drive shaft and meshed with the driven gear, operating means secured to the drive shaft, a two-part unidirectional clutch carried by the drive shaft between said arms, one of said clutch parts being fixedly circumposed on the drive shaft for rotation therewith, the other of said clutch parts being rotatably circumposed on the drive shaft alongside the first part, a locking member carried by the arms and positioned across said arms adjacent said other clutch part, interconnecting means between said other clutch part and the locking member for holding the other clutch part against rotation and locking it to the arms, said interconnecting means including a

tongue on the other clutch parts fitted in a slot in the locking member, means mounting said locking member on the arms for releasable fixed relationship therewith, said mounting means for the locking member including a hinged connection between one end of the locking member and one of the arms so that the locking member is swingable away from the clutch to disengage said interconnecting means and a tongue on the other of the arms fitting in a slot in the other end of the locking member for locking the member in relation to the clutch so that the interconnecting means is operative, said other clutch part being internally bored and embracing said one part, said one part having a plurality of pockets formed in its peripheral surface and cam surfaces extending tangentially from said pockets, ball elements disposed in said pockets and operable by the cam surfaces into engagement with said internal bore of the other of said clutch parts to lock said one part and the shaft against retrograde movement.

---



**2,769,614**
**SHAFT SINKING MACHINE**
Victor Zeni, Morgantown, W. Va.
Application August 12, 1953, Serial No. 373,727
1 Claim. (Cl. 255—4.8)

In a shaft sinking machine, a circular plate providing an operating head, a cylindrical casing extending downwardly from the peripheral edge of said plate, a plurality of rotary toothed inclined cutters journaled on the lower edge of said casing, a first platform arranged in spaced parallel relation above said plate, U-shaped clips extending between said plate and platform, a second platform arranged in spaced parallel relation above said first platform, a disc supported above said second platform, a horizontally disposed screen positioned above said disc, anti-torque vises including threaded studs, sleeves engaging said studs, a plurality of hydraulic cylinders pivotally mounted on said first platform, a plurality of motors mounted on said first platform, a vertically disposed anti-torque shaft having a flange on its lower end secured to said disc, a head on the upper end of said shaft having an eye extending therefrom, struts connecting said disc to said first platform, said first platform being stationary and said plate being mounted for rotary motion about a vertical axis, a horizontally disposed partition arranged adjacent the upper end of said casing providing an open chip collecting area, nozzles arranged adjacent said rotary toothed cutters for directing air against said cutters, conduits for conveying compressed air to said nozzles, ducts for conveying cuttings upwardly and into said chip collecting area, a vacuum pump connected to said ducts, reduction gear units connected to said motors, pinions extending from said reduction gear units, a gear extending upwardly from said plate and meshing with said pinions, a hydraulic pump for supplying fluid to said cylinders, valves for controlling flow of hydraulic fluid to said cylinders, pistons reciprocally arranged in said cylinders and having rods extending upwardly therefrom, levers pivotally connected to said rods, rollers mounted on the ends of said levers, anti-torque shoes engaging said rollers and said shoes being provided with projecting teeth, pins pivotally connecting said shoes to said studs, a frame extending upwardly from said sleeves for supporting said screen, nuts adjustably mounted on said studs for centering said shaft, there being an opening in said casing for the removal of cuttings, and a control unit positioned above said screen.

---

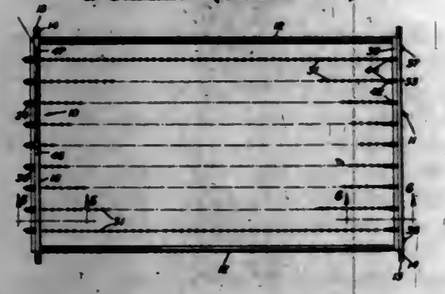
**2,769,615**
**CORE RECOVERY APPARATUS**
Gerald Burgess, Casper, Wyo.
Application April 6, 1953, Serial No. 346,840
4 Claims. (Cl. 255—72)

2. In core drilling apparatus, including an outer tube, a hollow bit at the lower end of said tube, and a hollow core barrel open at its lower end and disposed within said tube and movable upwardly and downwardly within said tube, the improvement wherein said outer tube is provided with a wall defining a fluid passage having a section of restricted cross-sectional area above a section of greater cross-sectional area, said wall being provided with a plurality of inwardly extending wings below said section of greater cross-sectional area, said wings having a greater longitudinal extent than said section of greater cross sectional area, said bit also having inwardly extending wings and the diameter at the inner edges of said wings corresponding to the diameter at said restricted area, and said core barrel having an outer diameter corresponding to said restricted area and being normally disposed below said restricted area but movable upwardly by the core to said restricted area to reduce the cross-sectional area available for flow of fluid downwardly past said core barrel.

---

**2,769,616**
**PREVENTION OF MUD CUTTING IN EARTH BORING DRILLS**
Erwin A. Morlan and Henry B. Woods, Houston, Tex., assignors to Hughes Tool Company, Houston, Tex., a corporation of Delaware
Continuation of application Serial No. 174,024, July 15, 1950. This application February 9, 1953, Serial No. 335,758
6 Claims. (Cl. 255—306)

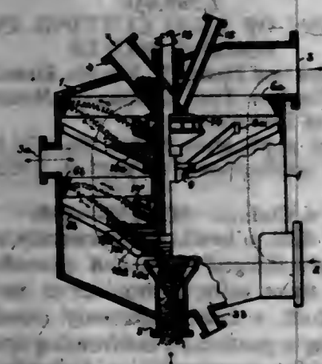
5. In a well drill, a head, a downwardly extending leg thereon, a shaft integral with and extending inwardly from said leg, there being a shoulder at the juncture of said leg and shaft, a cutter rotatively mounted on said shaft and having a portion in confronting spaced relation with said shoulder, a recess in said shoulder extending outwardly from the shaft, forwardly in the direction of rotation of the cutter on the shaft and terminating at its



outer end in the peripheral surface of the leg, and a quantity of wear resistant material bonded to the side walls and bottom of the recess so that said wear resistant

material effects progressive disintegration of abrasive material that builds up on the cutter and tends to effect mud cutting of the shoulder.

---



2,769,617
ELECTRIC LIVESTOCK GATE
Floyd K. Hutchinson, Somonauk, Ill.
Application October 18, 1955, Serial No. 541,239
2 Claims. (Cl. 256—10)

1. An electric livestock gate of the character described comprising: a pair of spaced, opposed, upstanding end frames, means connecting said end frames, a plurality of spaced, parallel flexible conductor members having one end anchored to one of the frames and insulated therefrom, a conductor bar mounted on the other frame, and means for detachably electrically connecting the conductor members to said conductor bar, the last-named means including levers pivotally mounted at an intermediate point on said other frame, contacts on one end portion of said levers connected to the conductor members and engageable with the bar, and coil springs connected to the other end portions of said levers for yieldingly urging same in a direction to engage the contacts with the bar.

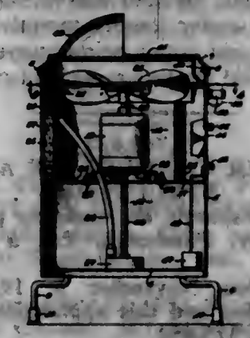
---

2,769,618
APPARATUS FOR PROCESSING OF AIR, GAS, VAPORS OR LIQUIDS
Frederick Nettel, Manhasset, N. Y.
Application December 17, 1953, Serial No. 398,696
7 Claims. (Cl. 257—1)

1. An apparatus for processing a medium such as air, gas or vapor using granular material for said processing, said apparatus comprising a closed shell having a substantially vertical axis, said shell having an inlet opening near the bottom and an outlet opening at the top for the medium, an inlet conduit at the top and an outlet conduit at the bottom of said shell for said granular material, a multiplicity of vertically stacked thrower wheel means mounted to rotate about a common vertical axis within and centrally of said shell, the uppermost thrower wheel means being disposed to receive said granular material from said inlet conduit, said thrower wheel means being arranged to throw said granular material upwardly and outwardly from the center part of said shell in free flight streams to its circumference, means to rotate said thrower wheel means, a multiplicity of stationary, slanted catcher means, each catcher means being located beneath a different thrower wheel means and being disposed to receive granular material after it has been thrown by the thrower wheel means directly above it in a free flight stream to the circumference of the shell and has rebounded therefrom in another free flight stream toward said catcher means so that the catcher means will guide said granular material back toward the center part of said shell below said thrower wheel means by gravity, the peripheries of said catcher means and the peripheries of said thrower wheel means being remote from the shell, each said catcher means including a center portion, the center portions of all said catcher means except the lowest, collecting the granular material and guiding it to the next lower thrower means, the central portion of the lowermost catcher means collecting the granular material and guiding it to said outlet conduit, the outlet opening for the medium being disposed above and at least in part radially inwardly of the part of the shell struck by the granular material flung from the uppermost thrower wheel means, said shell, thrower wheel means and catcher means providing in the shell a vertical annular passageway of substantial cross-sectional area for the medium, said passageway extending upwardly through the radially flowing free flight outward and return streams of the granular material and being located radially outwardly of the thrower wheel means and catcher means, the flow of said granular material and of the medium being substantially in counter-flow.

---

2,769,619
PARALLEL AND COUNTERFLOW OF AIR IN PREHEATER
Stephen Juhasz, San Antonio, Tex., assignor to The Air Preheater Corporation, New York, N. Y., a corporation of New York
Application February 19, 1952, Serial No. 272,317
5 Claims. (Cl. 257—6)



1. In an air preheater or the like having metallic surfaces for the transfer of heat to relatively cool air from hot corrosive gases whose temperature in the transfer of heat is reduced to a point approaching the dew point of the gases and subjects the metallic heat transfer surface to the deleterious effects of said substances in the presence of condensation; separate inlet and outlet ducts connected to the air preheater so as to direct a stream of gases therethrough in one direction in contact with said heat transfer surfaces; inlet and outlet ducts means for directing portion of the total volume of air to be heated in contact with the heat transfer surface in counterflow with respect to the direction of flow of the stream of gases from which said portion of the total air volume absorbs heat; another air inlet duct connected to said preheater at its air inlet end so as to direct another portion of the total volume of air through the air preheater in a direction parallel to the flow through the preheater of the stream of gases from which said second portion of the total volume of air absorbs heat; means for apportioning the total volume of air between the inlet duct connected for the flow of air in parallel and the inlet duct connected for directing the stream of air in counterflow; and an air outlet duct so connected as to conduct said parallel flowing stream of air away from the preheater.

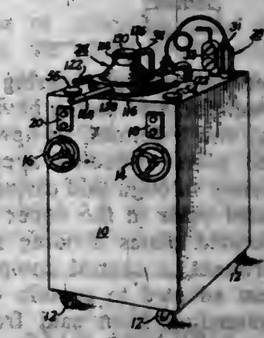
---

2,769,620
AIR CONDITIONER
Frank D. Davison, Pasadena, Calif., assignor to Irl R. Godshaw, Beverly Hills, Calif.
Application May 24, 1954, Serial No. 431,808
2 Claims. (Cl. 257—9)

1. A portable air cooler comprising a substantially uniform diameter casing having a normally vertical axis, an upper compartment, a lower compartment of substantially the same size as said upper compartment, a partition between said compartments having openings therein to permit a fluid in said upper compartment to flow into said lower compartment, said lower compartment serving as a fluid reservoir, a platform on said partition, a motor on said platform in said upper compartment, said motor having a vertical shaft, a fan mounted on the upper end of said shaft, a water pump positioned at the bottom of said lower compartment and mounted on the lower end of said shaft, fluid dividing material positioned along the inner surface of the wall of said upper compartment, the wall of said upper compartment having openings therein to pass air to said fluid dividing material when said fan is rotated, means for conducting fluid from said pump to the upper surface of said fluid dividing material, and a semi-hemispherical air deflector rotatable above said upper compartment, said deflector covering substantially one-half of said upper compartment, the position of said deflector determining the substantially horizontal direction of the air deflected thereby during the rotation of said fan.

---

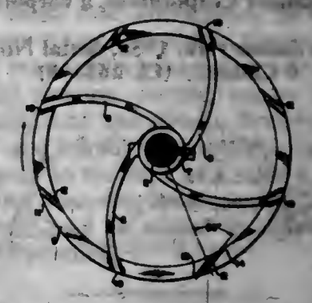
2,769,621
DEVICE FOR CHARGING LUBRICANTS
Theodore E. Nubbon, New York, N. Y.
Original application October 30, 1951, Serial No. 253,915. Divided and this application June 17, 1952, Serial No. 293,891
5 Claims. (Cl. 259—7)



1. In a device for charging the molecules of a lubricant, a casing, a hollow shaft rotatably carried in said casing and insulated therefrom, said shaft having a flange on the lower end thereof, a disc within said casing fixed in a predetermined spaced relation with respect to said flange, an insulating disc positioned on said first-mentioned disc, means to impress a high direct current potential across said shaft and said casing, and means to pass said lubricant

through said hollow shaft, between said flange and said insulating disc and then out from said casing.

---

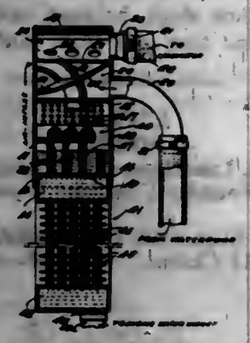


2,769,622
MIXER
Thorneel Jensen, Lawrence, N. Y., assignor to American Machine and Foundry Company, a corporation of New Jersey
Application August 20, 1952, Serial No. 305,333
11 Claims. (Cl. 259—8)

1. In a mixing device of the character described, the combination of a stator presenting a stationary annular frusto-conical confining wall, and a rotor presenting an annular confining wall mating with said stationary confining wall and forming therewith a generally frusto-conical space, said rotor having a plurality of mixing elements thereon formed by coil springs, each of which is an annulus and presents a substantially arcuate mixing portion extending radially toward said annular confining wall.

---

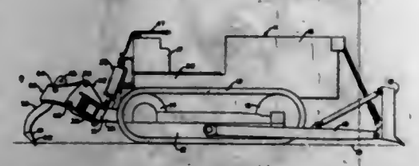
2,769,623
TURBINE MIXER
Richard L. Cawood, East Liverpool, Ohio, assignor to The Patterson Foundry & Machine Co., East Liverpool, Ohio, a corporation of Ohio
Application March 8, 1955, Serial No. 492,999
3 Claims. (Cl. 259—124)



1. A turbine mixer for mixing liquids which comprises a plurality of curved agitating blades attached to and extending outwardly from a centrally disposed hub and uniformly spaced circumferentially, the leading faces of said agitating blades being convex to impart a centrifugal action to the liquid, a supporting member provided at the outer extremities of the agitating blades and concentric with the hub, and a plurality of sheer blades mounted on the supporting member intermediate the agitating blades

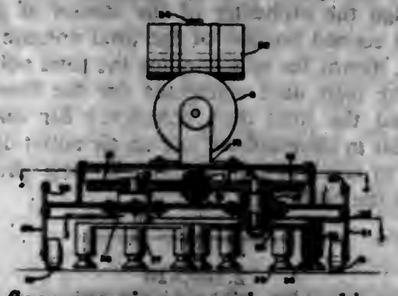
and having sharply formed leading and trailing edges, said shear blades being mounted on the supporting member so as to extend in the direction of the adjacent rearward agitating blades and being in the plane of rotation of the agitating blades.

---



2,769,624
AIR CLEANER AND MOISTENER FOR CARBURETORS
Okey S. Burnside, Middlesborough, Ky.
Application July 16, 1953, Serial No. 368,265
4 Claims. (Cl. 261—23)

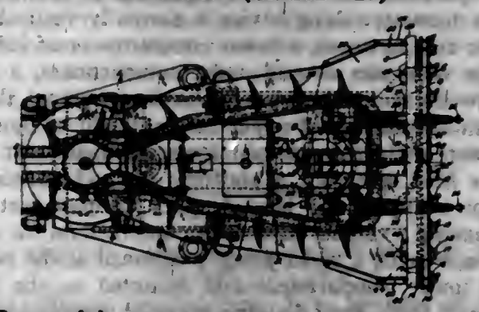
1. A humidifier comprising a casing adapted to be mounted atop a radiator, said casing having a front wall, a rear wall, a top, and a bottom, an upwardly extending arcuate perforated plate extending approximately centrally and transversely through said casing, a downwardly extending perforated plate in the upper portion of said casing, said perforated plates dividing said casing into an upper compartment, a central compartment, and a lower compartment adapted to contain water, a pair of air inlet pipes extending from said front wall downwardly and rearwardly to said lower compartment, an air and water fitting in said rear wall communicating with said central compartment and adapted to connect with a pump, a moist air outlet fitting in said rear wall communicating with said upper compartment and adapted to connect with a carburetor, means in said lower compartment for mixing air and water, outlet means for delivering mixed air and water from said lower compartment to the pump, said pump adapted to recirculate the water between the outlet means and the air and water fitting and means in the central compartment for separating the major portion of water from the air and water mixture whereby moist air may pass to said upper compartment.



---

2,769,625
SWINGABLE MOUNT FOR RIPPER BLADE
Mack Wooldridge, Oakland, Calif., assignor to American Tractor Equipment Corporation, a corporation of California
Application January 18, 1955, Serial No. 482,492
6 Claims. (Cl. 262—8)

1. In a tool of the character described, a horizontal beam, a plurality of spaced bearings disposed vertically along a forward face of said beam and each providing a separate mounting for a ripper blade, a plurality of U-shaped brackets extended about said beam, each bracket having its end hingedly supported by one of said bearings, and a ripper blade supported by each bracket and freely movable about a vertical axis with respect to said beam.



2,769,626
FLOOR COVERING REMOVING MACHINE HAVING YIELDABLE FLARED CUTTERS
Anthony F. Becker, Houston, Tex., assignor to The American Floor Surfacing Machine Company, Toledo, Ohio, a corporation of Ohio
Application August 30, 1954, Serial No. 453,084
6 Claims. (Cl. 262—19)

6. In a floor covering removing machine, a framework, wheels mounted on and supporting said framework, a rotatable head on said framework and means for imparting rotation thereto, a depending sleeve on said head, an axial shaft in said sleeve vertically movable therein, a tubular cutter loosely mounted on said shaft, the lower end of said cutter being outwardly flared, and spring means in said sleeve urging said cutter outwardly.

---

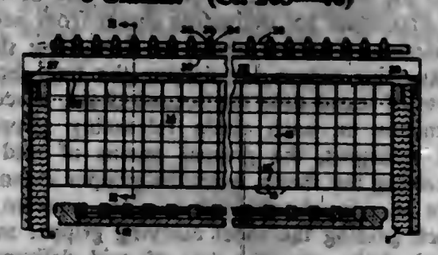
2,769,627
LOOP CUTTER CHAIN GUIDE AND DRIVE STRUCTURE
Joseph F. Joy, Pittsburgh, Pa., assignor to Joy Manufacturing Company, Pittsburgh, Pa., a corporation of Pennsylvania
Original application November 6, 1950, Serial No. 194,259. Divided and this application December 12, 1952, Serial No. 325,652
2 Claims. (Cl. 262—29)

1. In a mining apparatus, a support having an open-centered rectangular guide frame mounted in a transverse upright position on the forward portion of said support, said upright frame having a guideway about its margin, and an endless loop cutter chain guided for orbital circulation along said guideway, said chain having forwardly located cutters arranged to cut a kerf of such width as to receive said guide frame, said guide frame being laterally elongated and comprising upright side frame members and top and bottom cross frame members, said frame members having rearwardly located lugs near their adjacent joining ends and detachable securing elements engaging said lugs for securing said frame members together, said securing elements arranged in longitudinal parallelism with and rearwardly of said cross frame members close to the latter.

---

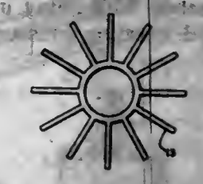
2,769,628
MINING MACHINE CUTTER BIT
Joseph F. Joy, Pittsburgh, Pa., assignor to Joy Manufacturing Company, Pittsburgh, Pa., a corporation of Pennsylvania
Application October 28, 1948, Serial No. 57,846
4 Claims. (Cl. 262—33)

1. A cutter bit comprising a bit body having a shank and an integral outer end portion providing a plane front face disposed at a substantial angle with respect to the longitudinal axis of the shank and a receding outer surface, said front face and said receding outer surface converging forwardly at the bit point, said end portion having a hole of uniform circular cross section formed therein close to and in parallelism with said front face with the forward side of said hole opening outwardly through said plane front face to provide a narrow slot extending to the



bit point, said hole opening outwardly through said receding outer surface, a hard metallic insert of generally cylindrical pluglike form received and secured by bonding in said hole, said slot being of less width than the diameter of said insert and said insert having a flattened front surface coextensive with said slot, said flattened surface lying flush with said front face and extending to the bit point to provide a wear-resisting cutting tip.

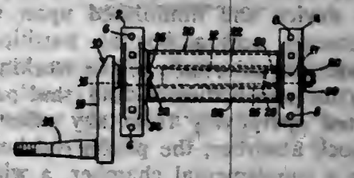
---



2,769,629
BAFFLE WALL CONSTRUCTION, PARTICULARLY FOR ROTARY HEARTH FURNACES
Robert E. Buckholdt, Salem, Ohio, assignor, by mesne assignments, to Salem-Brosius, Inc., a corporation of Pennsylvania
Application December 13, 1951, Serial No. 261,410
6 Claims. (Cl. 263—46)

1. A baffle wall structure for heating furnaces and the like comprising a plurality of vertical wall sections disposed in side-by-side relation to form a wall expanse; each of said vertical wall sections comprising in combination a first vertically disposed pipe member secured at its upper portion and depending downwardly into a heating chamber, an end cap member secured to and closing off the lower end of said first pipe member, said end cap member extending radially outward from said first pipe member, a plurality of generally single rectangular refractory blocks having centrally located vertically disposed apertures therein transfixed in superimposed relation on said first pipe member, the lowermost of said refractory blocks being supported by the radially extending portion of said end cap member, said radially extending portion being generally narrower than said blocks, said refractory blocks having interlocking annular tongue and groove portions in their top and bottom surfaces disposed substantially circumferentially about said first pipe member, the arrangement being such that the tongue portions of certain of said blocks interlock with the groove portions of vertically adjacent blocks, a second pipe member of lesser outside diameter than the inside diameter of said first pipe member positioned within said first pipe member substantially in concentricity therewith, the lower end extremity of said second pipe member being positioned a predetermined distance above said end cap member, cap means positioned around said second pipe member and secured to the upper end portions of said first and second pipe members to close off the annular opening therebetween, and conduit means communicating with said first pipe member near the upper portion thereof and adapted to be connected to a source of air under pressure whereby air may be caused to flow downwardly through the annular space between said first and second pipe members and upwardly through said second pipe member.

---

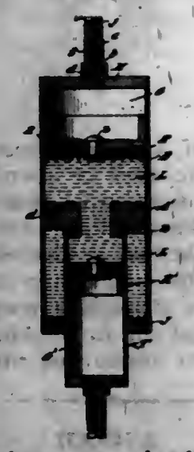


2,769,630
METHOD FOR ANNEALING TIGHTLY WOUND FLAT ROLLED METAL STOCK
John D. Keller, Pittsburgh, Pa.
Application March 19, 1954, Serial No. 417,423
6 Claims. (Cl. 263—52)

1. The process of annealing sheet metal strip, said process including the steps of assembling the strip by spirally winding the same under tension to form a compact coil between 93 and 97½% solid, charging a gas of at least twice the thermal conductivity of air between the convolutions of the wound strip under pressure sufficient to displace the atmosphere normally present, and subjecting the charged coil to annealing temperature for a period to uniformly anneal said strip.

---

2,769,631
AXLE ASSEMBLY
Raymond C. Pierce, Chicago, Ill.
Application April 8, 1952, Serial No. 281,182
9 Claims. (Cl. 267—57.1)



1. In a supporting assembly for a related vehicle body, spaced bearing blocks connected to said body, a shaft journaled in said bearing blocks, a throw connected to one end of said shaft and extending transversely thereof, a spindle extending outboardly of said body and connected to the throw at a point spaced from the connection to said shaft, a metal tube having splined engagement with said shaft, only adjacent an end of the tube and an end of the shaft, another metal tube surrounding the first mentioned tube and without direct connection thereto, lugs disposed on one of said bearing blocks engaging said other tube and restricting axial rotation thereof, means interconnecting both of said tubes and operative to flexibly resist rotation of said shaft, and readily demountable retaining means connected directly to the shaft at a readily available point externally thereof whereby, upon removal of said retaining means, said shaft may be moved axially thereof and removed from the assembly.

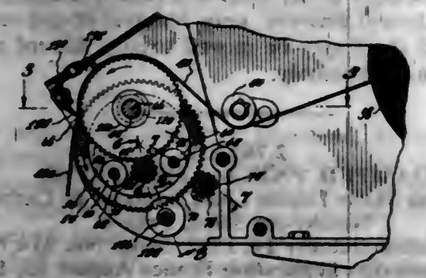
---

2,769,632
DAMPED PNEUMATIC SPRING
Christian Marie Lucien Louis Bourcier de Carbon, Neuilly-sur-Seine, France
Application October 14, 1952, Serial No. 314,715
Claims priority, application France August 13, 1952
4 Claims. (Cl. 267—64)

1. A combined damped pneumatic spring and hydraulic braking device adapted to function as a suspension spring

and shock absorber between two relatively movable members, said device comprising, in combination, an air-tight and liquid-tight casing adapted to be connected to one of said members and containing a substantially cylindrical working chamber, a piston disposed in said chamber and adapted to reciprocate therein upon relative movement of the members, a piston rod of enlarged diameter having an end fixed to said piston and its opposite end secured to the other of said members, said rod passing through a packed opening in one end wall of said casing; a body of working liquid in said working chamber within which said piston moves, and means for bypassing liquid in restricted flow past said piston in either direction as the piston moves in the chamber; a body of gaseous fluid within said casing at the opposite end thereof, said gaseous fluid being under a permanent high compression and exerting pressure upon the body

of working liquid, the pressure in the body of gaseous fluid being increased by the displacement of the working liquid upon entrance of successive increments of the enlarged piston rod into the casing upon the compression stroke of the device and diminished upon withdrawal of such increments, and a floating partition element fitted snugly with the side walls of the working chamber and separating the two bodies of fluid, said partition being disassociated operatively from any other operating part of the shock absorber, the piston rod being hollow thus providing a supplemental chamber, a wide opening through the piston to afford substantially unrestricted flow of working liquid into the supplemental chamber, a floating partition disposed in said supplemental chamber and bounding the body of liquid therein, and a body of gaseous fluid in the remote end portion of said supplemental chamber.



---

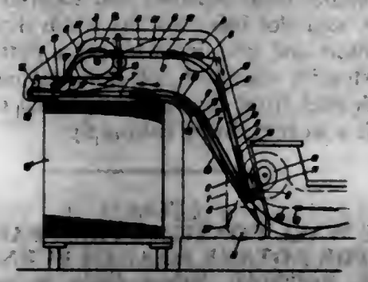
2,769,633

## DISPENSER FOR PRESSURE SENSITIVE ADHESIVE TAPE

Theodore H. Krueger, Stratford, Conn., assignor to Better Packages Incorporated, a corporation of New York

Application May 11, 1951, Serial No. 225,815
10 Claims. (Cl. 271—2.4)

1. A dispenser for pressure sensitive adhesive tape comprising a support for a roll of tape, a series of spaced feed discs to which the tape is adhered for feeding the tape from the roll, a series of spaced peeler discs mounted alternately with the feed discs, means for rotating said feed discs in tape feeding direction, means for rotating said peeler discs in the same direction as the feed discs but at a higher rate of speed, one set of said discs being mounted for rotation upon an axle and the other set of discs being in ring form and enclosing and bearing upon the axle supporting the first set of discs, and a second support for said ring-form discs passing through the rings outside of the peripheries of the axle supported discs.



---

2,769,634

## SHEET TRANSPORTING AND STACKING DEVICE FOR PRINTING MACHINES

Werner Koch, Offenbach (Main), Germany, assignor to Faber & Schleicher Aktiengesellschaft, Offenbach (Main), Germany, a body corporate of Germany

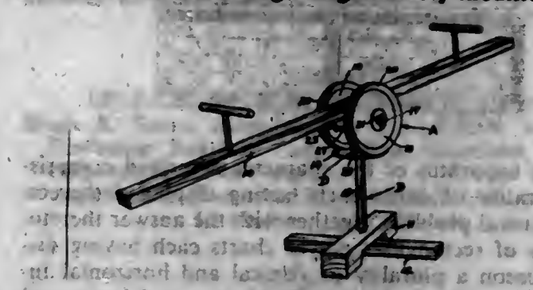
Application January 30, 1953, Serial No. 334,292
Claims priority, application Germany February 6, 1952
7 Claims. (Cl. 271—79)

1. In a printing machine for printing sheets, a device for transporting the sheets from a printing mechanism to a delivery stack at a decreasing rate of travel to effect overlap of the sheets while in transport, said device comprising a first chain for delivering sheets from said printing mechanism, a second chain for depositing sheets on said stack, drive means for driving the first chain at a higher rate of speed than the second chain, spaced apart gripper means on each chain releasably gripping the sheets in transport, the gripper means of said second chain receiving the sheets from the gripper means of the first chain in a predetermined transfer position, a first guide track guiding the sheet carrying gripper means of the second chain over the top of said delivery stack, means releasing the sheet from the gripper means of the second chain when above the delivery stack thereby depositing sucessive sheets thereon, a second guide track returning the gripper means of the second chain into said transfer position, the ends of said guide tracks joining at a sharp angle at which the gripper means reverse their travel, and a change-over switch at each of the joined ends of said guide tracks guiding the gripper means of the second chain from one track into the other, said change-over switches being controlled in their movement from the mechanism of the printing machine.

---

2,769,635

## REVOLVING TEETER-TOTTER



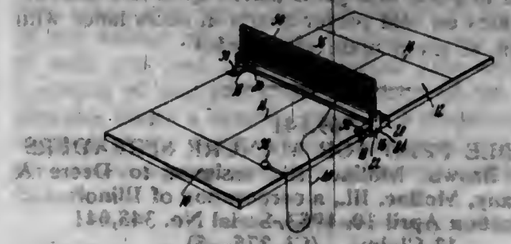
Melford H. Dockus, Northfield, Minn.

Application August 14, 1953, Serial No. 374,314
4 Claims. (Cl. 272—30)

1. In a self-turning teeter-totter, a carriage consisting of an axle shaft and a pair of supporting wheels revolubly mounted thereon, said wheels having treads of rubber, a fulcrum mounting fulcrumed on said axle shaft between said wheels, said mounting oppositely abutting said wheels and spacing them apart on said axle shaft, a teeter board intermediately supported on said fulcrum mounting, a platform member upon which the wheels of said carriage ride, carriage grid means guiding the carriage swivelly relative to said platform member and directing the wheels thereof in a circular path on said platform member, said

guide means comprising a vertical spindle revoluble in said platform member and a sleeve on said carriage shaft secured to the upper end of said spindle, the ends of said sleeve oppositely abutting said mounting, a pair of similar crank-shaped dogs, one for each wheel, each dog including a shaft portion, an arm thereon and a terminal lug on said arm, the shaft portion of one dog being mounted on the fulcrum mounting to one side of said axle shaft a lesser distance than the radius of its respective wheel, the shaft portion of the other dog being similarly mounted on said

fulcrum mounting to the opposite side of said axle shaft, the shaft portion of each dog pivotally supporting its respective arm pendulously with the lug on said arm underreaching the lower rear quarter of its respective carriage wheel transversely of its tread in near proximity thereto, such lug being adapted to engage frictionally the periphery of the rubber tread of such wheel and cause the turning of such wheel a step forward upon tilting movement of said fulcrum mounting in direction elevating the dog.



---

2,769,636

## TABLE TENNIS BOARD

Harry Z. Finestone, Revere, Mass., assignor to Jacob S. Cohen, doing business as American Toy Products Co., Beverly, Mass.

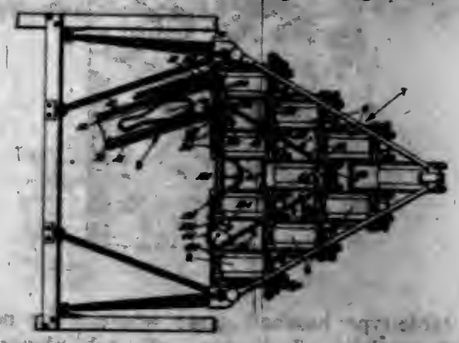
Application March 25, 1954, Serial No. 418,635
1 Claim. (Cl. 273—30)

A game board comprising two rectangular sections, two hinge devices connecting said sections at mutually adjacent corners thereof, each said hinge device consisting of an upright plate with a pair of struck-up loops arranged one over the other and two channel members pivotally attached to the lower corners of the plate, means securing said channel members respectively to corner margins of said board sections, a net frame consisting of a heavy wire having a horizontal portion extending across said board and a vertical portion at each end engaged in and supported by the struck-up loops of the corresponding hinge device, and a net attached to said net frame.

---

2,769,637

## DISTRIBUTOR MECHANISM FOR BOWLING PIN SPOTTING MACHINES



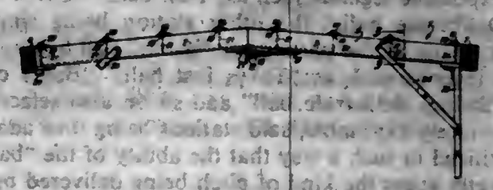
John Zuercher, Buffalo, N. Y., assignor to American Machine & Foundry Company, a corporation of New Jersey

Application April 5, 1952, Serial No. 280,697
6 Claims. (Cl. 273—43)

1. Pin distributing mechanism for a bowling pin spotting machine comprising a support, a pin scatter provided with a plurality of [illegible] mounting said support for movement in a horizontal plane,

a pin receiving pan mounted on said support, an elongated generally U-shaped channel having one end thereof pivotally attached to said support beneath said pan for movement in substantially a vertical plane, an endless pin conveying belt located in said channel and running along said channel, means driving said belt to travel pins delivered onto said belt by said pan to a point of discharge at the free end of said channel into a selected pin receptacle, and means for locating said channel adjacent each receptacle into which a pin is to be discharged, a stop pin movably mounted on said free end of said channel, a stop adjacent each of said receptacles, said stops being mounted along

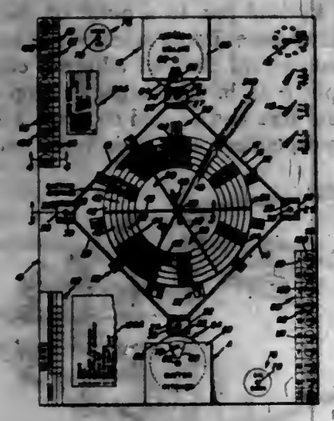
the path of travel of said free end of said channel and in position to be engaged in succession by said stop pin to hold said free end of said channel stationary adjacent an empty receptacle for delivery of a bowling pin thereinto, trigger means mounted on the free end of said channel and connected to said stop pin, said trigger means being operative by a bowling pin in response to its discharge from the free end of said channel into an empty receptacle for moving said stop pin out of engagement with a stop and permitting said locating means to move said channel and locate said free end of said channel at the next empty receptacle to be filled.



---

2,769,638

## SIMULATED HOCKEY GAME BOARD



Lester H. Knapp, Albany, N. Y.

Application May 21, 1954, Serial No. 431,465
3 Claims. (Cl. 273—85)

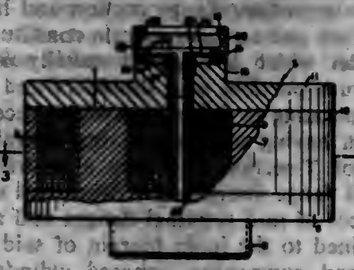
1. A hockey game board comprising an elongated, generally rectangular structure having a playing field comprising two plane surfaces; means forming a centrally disposed goal at each end of said field; upstanding sides on said structure converging toward said goals from zones adjacent thereto; a plurality of longitudinally spaced pairs of oppositely disposed bearings on each side of the center of said field carried by said upstanding sides and adapted to receive cylindrical playing sticks both rotatable and longitudinally slidable therein and having at least one ball-hitting element thereon disposed over said playing field; at least one of the bearings of each pair thereof intermediate the center of said field and the pairs immediately adjacent said goals having the upper half thereof hingedly secured to the side wall carrying said bearing; whereby the number of playing sticks available for use during a game may be readily adjusted to conform to the number of players; and said plane surfaces sloping downwardly from the center of said field to said goals; whereby, a free ball on said field will roll into one of said goals unless intercepted by a player guarding that goal with one of said sticks.

2,769,639
## SIMULATED BASEBALL GAME
Frank E. Seale, Lexington, Ky.
Application June 8, 1953, Serial No. 359,998
9 Claims. (Cl. 273—93)

1. A table-type baseball game wherein the performance and resultful effectiveness of each player, while batting, is predicated on and proportional to his known batting average comprising: a game board, a baseball diamond delineated for use on the surface of said game board, a plurality of manually maneuverable playing pieces representing the aforementioned players and sufficient in number to provide at least two full opposing teams, the players of one team being markedly different from the players of the other team to differentiate the players of the home team from those of the visiting team, each player carrying a permanently displayed number, 200, 250 or 400, for example, indicative of his known batting average, sequentially numbered lineup boxes provided on the surface of said board and having spaces for placement of the players of the respective teams, concealable pitcher-batter incident stations cooperable with said baseball diamond and players and usable by the participants, one of said stations being usable by the participant "pitcher" and having selectively and separately exposable legends such as "Fast ball," "Curve ball" and "Deliberate ball," the other station being simultaneously usable by the participant "batter" and having prescribed legends such as "Takes fast ball," "Bunts curve ball," "Swings deliberate ball" and so on also selectively and separately exposable, said stations being thus adapted to be utilized in such a way that the ability of the "batter" to correctly guess the kind of pitch being delivered by the "pitcher" increases the expectancy of a favorable play result for the "batter," and vice versa, if the "pitcher" outwits the "batter," the legend selected by the "pitcher" and legend selected by the "batter" serving, when they are both brought to light, to define the combined incident, for example, "Pitcher throws a fast ball—batter bunts fast ball," a pitcher-batter incident chart having corresponding combined incidents thereon, for example, "Pitcher throws fast ball—batter bunts fast ball," each incident having a key number, 4 for example, dialing means including a stationary statistical data dial made up of rated numbers based on known batting averages or percentage statistics, key numbers corresponding to like key numbers on said pitcher-batter incident chart arranged around the margin of said stationary dial, a manually rotatable percentage finder dial mounted for rotation on and above said stationary data dial and having peepholes therein registrable with said rated numbers and also having a fixed indicating arrow registrable with the marginal key numbers and serving to direct the "batter" to an intended self-explanatory directive on a final tell-tale chart.

2,769,640
## EDUCATIONAL MATHEMATICAL GAME APPARATUS
Ruth B. Elder, Flint, Mich.
Application May 4, 1953, Serial No. 352,821
1 Claim. (Cl. 273—135)

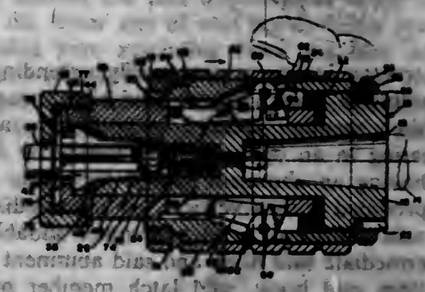
A game apparatus of the character described comprising a plurality of cards each having displayed thereon a mathematical problem together with the answer thereto, a plurality of rectangular player charts each having displayed thereon a plurality of vertical and horizontal intersecting lines forming vertical columns and horizontal rows of squares, numerical indicia representing problem components in the squares in a marginal row of squares, numerical indicia representing other problem components in the squares in a marginal column of squares, other numerical indicia in certain other squares each indicating the answer to a mathematical problem involving the components in the marginal squares of the row and columns of squares intersecting in said certain other squares, the remaining squares of said charts being blank, said charts each differing in the position of said answer-bearing squares and said blank squares, a master chart also having a marginal row and a marginal column of squares bearing indicia representing problem components and having answer-bearing indicia in all of its remaining squares, both similar to those of the player charts, and game pieces positionable upon the answer-bearing squares of said player charts whereby players are required to place said game pieces upon said answer-bearing squares on said player charts in accordance with the problems as given upon said cards.



2,769,641
## REVERSIBLE FEED FOR MANURE SPREADERS
Theophilus Brown, Moline, Ill., assignor to Deere & Company, Moline, Ill., a corporation of Illinois
Application April 10, 1953, Serial No. 348,641
13 Claims. (Cl. 275—5)

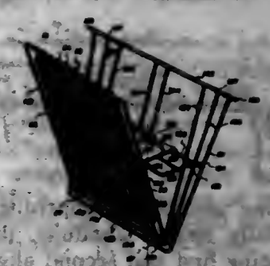
1. In a manure spreader: a longitudinal body having a discharge end and including a floor along which manure is fed to said discharge end; an endless-belt type feeder apron running lengthwise of the body with its upper run overlying the floor; reversible drive means supported by the spreader body and engaging the apron and including an input shaft; first and second coaxial toothed ratchet wheels keyed to the input shaft and respectively having their teeth pointing in circumferentially opposite directions; a pawl carrier supported by the spreader body for reciprocation adjacent to the ratchet wheels and in a path transverse to the axis of the ratchet wheels; means connected to and for reciprocating the pawl carrier; first and second axially offset pawls pivotally carried by the pawl carrier and extending respectively in circumferentially opposite directions and respectively biased to engage the teeth of the first and second ratchet wheels; a first pawl-lifting member shiftably mounted on the spreader body and operatively connected to the first pawl to selectively effect engagement and disengagement of said first pawl and first ratchet wheel; a second pawl-lifting member shiftably mounted on the spreader body and operatively connected to the second pawl to selectively effect engagement and disengagement of said second pawl and second ratchet wheel; and means interconnecting the pawl-lifting members for simultaneously shifting either pawl-lifting member to pawl-disengaging position and the other pawl-lifting member to pawl-disengaging position.

2,769,642
## SELF-CENTERING MAGNETIC CHUCK
Hugh E. Berry, Scarsdale, N. Y., assignor to Norma-Hoffmann Bearings Corporation, Stamford, Conn., a corporation of New York
Application December 31, 1954, Serial No. 479,049
10 Claims. (Cl. 279—1)



1. A chuck for supporting a work piece while an operation is performed thereon, said chuck having a face forming a seat for the work piece and principal work holding means wherein the major holding force is essentially normal to said face, a plurality of contact blocks arranged to contact the edges of the work piece at a plurality of spaced points to aid in properly positioning the work piece and to secure it against sidewise movement while the operation is being performed thereon, and bendable arms supported at one end thereof by the chuck, one of the contact blocks being secured at the opposite end of each arm and having a beveled face which contacts a section of said edges, the free ends of the arms being movable under a bending stress in a direction normal to the face of the chuck when the edges of the work piece are moved against and are contacted by said beveled faces.

2,769,643
## COLLET CHUCKS
Berthold Demmler, Chicago, Ill., assignor to Davos Products Co., Chicago, Ill., a partnership
Application April 26, 1954, Serial No. 425,385
6 Claims. (Cl. 279—50)

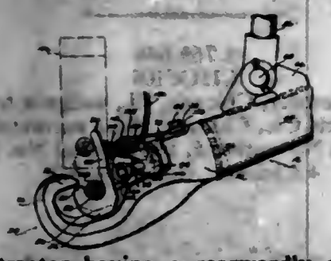


1. A collet chuck comprising a body having a cylindrical slotted stem, said slotted stem having a bore forming a collet receiving socket, a ring member secured to said body and pivotally supporting a plurality of levers, a slotted sleeve axially slidable on said stem with the slots thereof cooperating with said levers, means secured to the front of said slotted sleeve engageable with the nose of said stem, a manually engageable clutch sleeve freely rotatable on said ring and said slotted sleeve and movable axially thereof and adapted when moved forwardly to engage the means on the front of said slotted sleeve and move same away from the nose of said stem to permit expansion of same, and said clutch sleeve when moved rearwardly adapted to pivot said levers to move said slotted sleeve rearwardly and cause the means on the front of the slotted sleeve to contract said slotted stem.

2,769,644
## CHUCKS
Berthold Demmler, Chicago, Ill., assignor to Davos Products Co., Chicago, Ill., a partnership
Application November 6, 1952, Serial No. 318,975
4 Claims. (Cl. 279—51)

1. A collet chuck comprising a body having a cylindrical stem, said stem having a bore forming a collet receiving socket, an expandable and contractible collet extending thereinto, a spring member normally urging said collet forwardly out of said socket, a ring member secured to said body and pivotally supporting a plurality of levers, a draw sleeve axially slidable on said stem and engaging the forward end of said collet to retain same in said socket, said draw sleeve having slots cooperating with said levers, a hand engageable sleeve freely rotatable on said said ring and draw sleeve and movable axially thereof and adapted when moved forwardly to permit said spring to urge said collet and said draw sleeve forwardly to position said collet in said socket to expand said collet and when said hand engageable sleeve is moved rearwardly to move said draw sleeve and said collet in said socket to contract same.

2,769,645
## COLLAPSING SEAT FOR NESTING CARRIERS
Fred W. Young, Oklahoma City, Okla., assignor to Sylvan N. Goldman, Oklahoma City, Okla.
Application May 18, 1954, Serial No. 430,567
6 Claims. (Cl. 280—33.99)



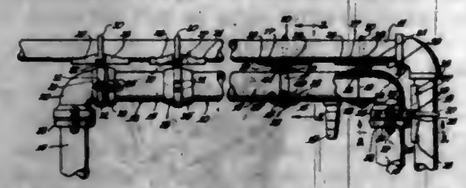
1. In a folding seat structure for use in a nesting carrier, said seat structure including in combination with a swinging gate, a panel structure forming a seat back swingably hinged to the base portion of the gate, a seat hinged to a medial portion of the gate structure for movement from an upper position against the gate to a horizontal seating position, a stop member fixed to the panel structure for supporting the seat when in horizontal seating position, and hinged link means pivotally connected to the under side of the seat and pivotally connected to the panel structure at a point below the stop member for moving said seat on its hinges.

2,769,646

## TRACTOR IMPLEMENT HITCH HAVING A POSITIVE LOCKING LATCH

Gene L. Omen, Milwaukee, and Earl C. Thayer, Racine, Wis., assignors to J. I. Case Company, Racine, Wis., a corporation of Wisconsin

Application January 26, 1953, Serial No. 333,068
3 Claims. (Cl. 280—504)



1. In a tractor having a rearwardly extending draft arm terminating in a hitch means, said hitch means comprising a hitch member secured integrally to said arm and terminating in an upwardly and forwardly directed hook and having an abutment spaced forwardly of said hook and provided with a vertical lug intermediate said hook and said abutment, a latch member slidable fore-and-aft intermediate said hook and said abutment from a position within said hook, said latch member provided with a transverse saddle and a pair of forwardly-directed bifurcations adapted to receive said lug therebetween in slidable relation, said bifurcations provided with fore-and-aft extending longitudinal slots, a transverse pin fixed in said lug and cooperating with said slots to limit sliding of said latch member to a fore-and-aft direction, a latch lock having a transverse body portion and spaced arms, said arms positioned to receive said forwardly-directed bifurcations therebetween, said spaced arms pivoted on said transverse pin to allow said transverse body portion to be positioned intermediate said abutment and said forwardly-directed bifurcations to prevent said latch member from being displaced forwardly out of said hook, said latch lock rotatable about said pin to permit said latch member to slide forwardly and out of said hook.

2,769,647

## PIPE-LINE ASSEMBLY AND COUPLING MEANS THEREFOR

William H. Harnisch, Oak Park, Floyd G. Hodsdon, La Grange, and Harold W. Hein, Chicago, Ill., assignors to International Harvester Company, a corporation of New Jersey

Application April 14, 1954, Serial No. 423,832
10 Claims. (Cl. 285—31)

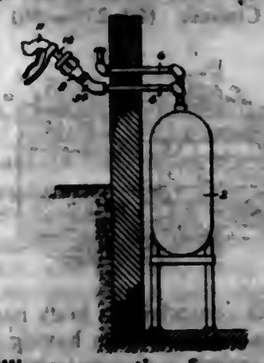
9. A pipe-line assembly comprising first and second relatively radially spaced conduits, the second of said conduits including first and second aligned sections, each section having first and second oppositely disposed ends, a first end of one section being positioned adjacent the second end of a second section, means connecting one of said sections to said first conduit against relative longitudinal displacement, a coupling member disposed between adjacent ends of said sections, said coupling member including a flexible sleeve having an open-end bore receiving said adjacent ends in telescoping relation, a flexible abutment projecting radially inwardly within said bore, said abutment being engaged by said adjacent ends in sealing relation, a bracket connected to said sleeve, and means adjustably connecting said bracket to said first conduit.

2,769,648

## REINFORCED T SHAPED SEAL FOR FLANGED PIPE COUPLING

Albert Dale Herman, Racine, Calif., assignor, by mesne assignments, to Aeroquip Corporation, Jackson, Mich., a corporation of Michigan

Application April 21, 1953, Serial No. 350,126
4 Claims. (Cl. 285—110)



1. A coupling for joining the ends of the sections in a fluid line, comprising: a pair of tube flange units, each including a collar portion, a bell mouth portion flaring outwardly therefrom, an intermediate flange portion extending radially outwardly from said bell mouth portion, and a terminal flange folded inwardly from the periphery of the said intermediate flange portion and having a flat radial inner face and an inner margin constituting a cylindrical shoulder which is disposed radially outwardly of said bell mouth portion, said shoulders and bell mouth portions cooperating to define an annular recess of trapezoidal section having inwardly flaring lateral walls; and a seal ring of T-section including a central leg in the form of a flat flange interposed between and sealed to the flat inner faces of said terminal flanges and a cross-head integrally joined to the inner margin of said central leg, said cross-head comprising opposed cylindrical flanges projecting axially from opposite sides of said central leg, and reinforcing rings encircling said cross-head flanges adjacent the respective sides of said central leg, fitted within said cylindrical shoulders of the terminal flanges with a piloting action and supporting said cross-head flanges against radial expansion under the fluid pressure in said line, said central leg and cross-head being of soft, flexible, yieldable material and said reinforcing rings being of rigid non-yielding material, said cross-head flanges having marginal portions projecting axially beyond the outer sides of said reinforcing rings and in sealing engagement with flaring inner walls of said bell mouth portions to provide a seal that is made more fluid tight by yielding of said projecting marginal portions of the cross-head flanges under the fluid pressure in said line.

2,769,649

## PORTABLE FILLING CONNECTION

Frank P. Scully, Belmont, and Alcide Edward Mathey, Boston, Mass., assignors to Scully Signal Company, Cambridge, Mass., a corporation of Massachusetts

Application July 30, 1952, Serial No. 301,624
5 Claims. (Cl. 285—175)

2. A tight filling connection for use with a tank having a fill pipe with an internal standard pipe thread on its outer end, comprising a tubular casing threaded externally at its upper end, an apertured disk for receiving a spout of larger diameter than said aperture resting on the upper end of said casing, a washer resting on said disk having an aperture therethrough larger than the aperture through said disk but smaller than the internal diameter of the upper end of said casing, a screw cap having an inturned flange screwed on the upper end of said casing with said flange holding said washer and disk firmly against the upper end of said casing, said casing threaded externally at its lower end, said last thread being of the same pitch as said standard pipe thread of said fill pipe and of less than standard diameter, an undercut shoulder above said threads, a sealing ring positioned against said undercut shoulder adapted to engage the end of a pipe to which said connection may be screwed and a plurality of webs spaced about the interior of said casing adapted to prevent the spout regardless of its diameter when positioned within said casing from causing sealing engagement with the interior wall of said casing.

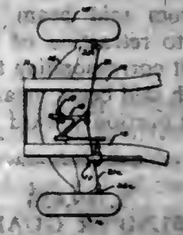
2,769,650

## TABLE LEG MOUNTING BRACKET AND LATCH STRUCTURE THEREFOR

Charles O. Larson, Sterling, Ill.

Application February 18, 1953, Serial No. 337,589
6 Claims. (Cl. 287—14)

1. In combination a bracket having a pair of spaced side plates adapted to be attached to a planar support to extend normally thereto, means for securing said side plates to the under surface of said support, a leg having an upper end portion shaped to be slidably disposed between said spaced side plates, each of said side plates having vertically disposed elongated closed slots formed therein and disposed normal to the plane of said support, said closed slots being formed centrally of the lateral marginal edges of each of said plates, each plate having an additional elongated open slot spaced from and disposed in line with the closed slot of each of said plates, said open slots of each plate having the outer ends opening onto the lower marginal edge of each of said plates, a pair of spaced bolts normally disposed in said aligned closed and open slots, said bolts passing through the upper central portion of said leg and being spaced apart such that when the upper bolt is at the upper end of the upper closed slot the lower bolt will be at the upper end of the lower open slot and when the upper bolt is at the lower end of its slot, the lower bolt will be disposed wholly beyond the open end of the lower open slot, and the lower walls of each plate beginning with the outer open end of said open slots curving arcuately outwardly in opposite directions from each adjacent wall of said open end of said open slot and then extending substantially parallel to and directed away from said open slot toward the opposite end of said plate and forming on opposite marginal sides of said plate in equally spaced relation from the walls of said closed slots a pair of notches spaced laterally and equally from and in line with the upper end of said closed slots, said notches being open at their bottom portions and in position to receive the lower bolt therein.



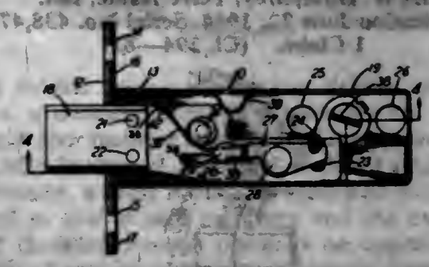
2,769,651

## ADJUSTABLE IDLER ARM SUPPORT

Paul C. Cain, Kosciusko, Miss.

Application January 9, 1953, Serial No. 330,527
2 Claims. (Cl. 287—100)

1. For use with a vehicle chassis having a transverse frame member supported by a pair of front wheels, an idler arm positioned adjacent said frame member, a steering gear connected to said idler arm, and steering linkages operatively connected to said wheels and each pivotally connected to said idler arm; a device for connecting said idler arm to said cross member for oscillatory movement, said device comprising an upstanding bracket, a pair of bosses arranged in superimposed spaced axially aligned relation carried by said bracket, the upper one of said bosses being provided with a smooth bore, a bushing in the smooth bore of the upper one of said bosses, said bushing having a bore tapering inwardly from the face adjacent the lower one of said bosses and terminating at a point spaced from the other face remote from the lower one of said bosses, a flange on said bushing and bearing against the face adjacent the lower one of said bosses, the lower one of said bosses being provided with a threaded bore extending from the face adjacent the upper one of said bosses to the other face remote from the upper one of said bosses, an externally threaded bushing in threaded engagement with the threaded bore



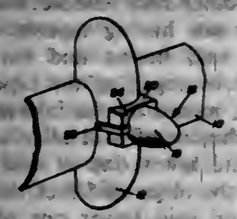
of said lower one of said bosses, said threaded bushing having a bore extending inwardly from the face adjacent the upper one of said bosses and terminating at a point spaced from the other face remote from the upper one of said bosses, a pin having tapered end portions positioned between said bosses and having each of the tapered end portions engaging the tapering bore of the adjacent bushings, means on the intermediate portion of said pin for attachment of said idler arm thereto, there being a slot in said lower one of said bosses extending from said face to the other said face thereof, cooperating fastening means on said lower one of said bosses for releasably clamping the latter to said threaded bushing to prevent rotation of the threaded bushing in said lower one of said bosses, each of said bushings having a peripheral annular groove and a transversely extending passage in communication with said groove and the tapering bore of the adjacent bushing and also in communication with a lubricant passage formed in the adjacent boss, and means on said bracket for attaching the latter to said frame member.

2,769,652

## DEADLOCKING MECHANISM FOR AUXILIARY DOOR LOCKS

Orville C. Maurits and Paul H. Grevengood, Grand Rapids, Mich., assignors to Dexter Industries, Inc., Grand Rapids, Mich., a corporation of Michigan

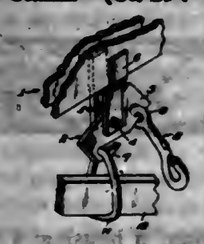
Application March 28, 1955, Serial No. 497,258
2 Claims. (Cl. 292—169)



2. A lock, comprising: a housing; a front aperture; a bolt slideably received in said aperture; a retractor member connected adjacent its forward end to said bolt, and

having a slot at the rearward end formed by opposite walls spaced from each other in the direction of sliding movement of said bolt, and also having a central slot having axially opposite surfaces spaced apart by an amount at least equal to the distance of sliding movement of said bolt; a radius arm rotatably mounted in said housing on an axis transverse to the path of sliding movement of said bolt, said radius arm having a member slideably engaging said slot; a deadlocking lever pivotally mounted at the central portion thereof on said retractor member, said lever having a rearward portion extending beside and across said slot, and a locking portion provided with a hook extending forwardly, whereby transverse movement of said radius arm member along said slot causes said radius arm member to position said lever about its pivot mounting; transverse beam means received within said central slot and fixed with respect to said housing, and disposed for engagement with said locking portion with said bolt in fully projected position, said retractor member slot and rearward portion of the lever being formed to cause disengagement of said locking portion from said beam, on rotation of said radius arm, prior to retraction of said bolt beyond the position of said bolt corresponding to engagement of said locking portion with said beam means; and biasing means urging said locking portion toward said beam means.

---



2,769,653
**BUMPER GUARD**
Frank Lazan, Jr., Morgantown, W. Va., assignor of fifty percent to Aldo Giancola, Morgantown, W. Va.
Application February 16, 1953, Serial No. 337,073
1 Claim. (Cl. 293—71)

A protective device for use in combination with a bumper guard on a vehicle bumper, said device comprising a body of resilient flexible material, said body including a base having a concave inner surface and a substantially flat outer surface, said body further including a substantially conical section integrally formed with said base, said body having an aperture therethrough in the plane of the flat outer surface of said base, and a strap extending through said aperture in said body with a midportion of said strap being retained in said body, the end portions of said strap being received between said bumper guard and said bumper, and a fastener securing said bumper guard to said bumper urging said bumper guard toward said bumper clampingly holding said end portions of said strap between said bumper guard and said bumper.

---

2,769,654
**AUTOMATICALLY RELEASING SHACKLE**
Irl W. Humphrey, Terre Haute, Ind.
Application June 22, 1954, Serial No. 438,477
1 Claim. (Cl. 294—83)

In combination with a hoisting block provided with the usual open clevis having a pair of spaced depending arms, a shackle bar of substantially rectangular shape and of rectangular cross section throughout its length, a bolt adapted pivotally to attach said shackle bar between the depending arms of said clevis, said bolt passing through a hole bored substantially centrally in said shackle bar and through holes provided in the lower ends of the depending arms of said clevis, a diagonal open slot forming a hook located at one end of said shackle bar, said slot having an opening pointing upwardly when the shackle bar is in its load-carrying position and downwardly when the shackle bar is in its load-releasing position, a snap hook pivotally mounted at the opposite end of said shackle bar with its pivot point off-set from the central axis of the shackle bar so that the weight of the snap hook is attached on the same side of said central axis as the slot opening and so the weight of the snap hook tends to rotate the shackle bar to its load-releasing position, said snap hook being attached to the shackle bar by a link which is larger than the space between the depending arms of the clevis so that the shackle bar cannot be rotated beyond its load-carrying position in one direction.

---

2,769,655
**INTERNAL PIPE GRIPPING TOOL**
Lloyd R. Holmes, Vermillion, S. Dak.
Application April 10, 1953, Serial No. 348,029
10 Claims. (Cl. 294—94)

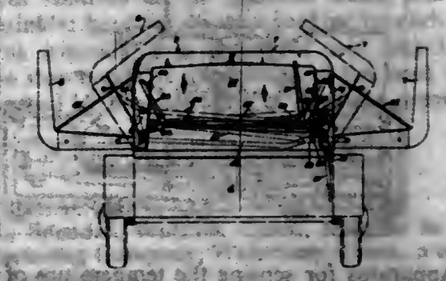
1. In combination, a pipe buried in the ground and a tool for engaging and gripping the interior surface of said pipe at a point remote from and intermediate of its ends; said tool comprising, a hollow internally tapered and threaded partially split sleeve, a tapered threaded core threadably engaging said hollow internally tapered and threaded partially split sleeve for expanding the same into gripping engagement with the interior surface of the pipe, a plurality of stiff bristles secured to said sleeve and extending beyond its periphery, means secured to said core to limit movement of said core relative to said sleeve in one direction, and means secured to the top of said core for securing it to a well drilling rig; said bristles describing a circle larger than the internal diameter of said pipe and frictionally engageable therewith to limit rotation of the sleeve relative to said pipe.

---

2,769,656
**VEHICLE CAB AND FRONT END MOUNTING**
Fred A. Lee, Fort Wayne, Ind., assignor to International Harvester Company, a corporation of New Jersey
Application July 31, 1953, Serial No. 371,567
7 Claims. (Cl. 296—35)

1. In a motor vehicle having a longitudinal frame comprising a pair of longitudinally extending, transversely spaced side sill members; a vehicle body including an operator's compartment, a hood structure extending forwardly from said operator's compartment and secured thereto, and a vertically disposed, transversely extending grille radiator panel secured to said hood structure and defining the forward extremity of said body, said body further including a first transversely extending cross member secured to the lower edge of said radiator grille panel, a second transversely extending cross member secured to the underside of the rearward end of said operator's compartment, and a transversely extending channel-shaped member secured to the underside of said body and being longitudinally spaced between said first and second cross members; means for supporting said body above said frame including a pair of transversely spaced links, each of said links having one end pivotally connected to a respective sill member and its opposite end pivotally connected to a respective end portion of said first cross member, a second pair of transversely spaced links, each of said links having one end pivotally connected to a respective sill member and its opposite end pivotally connected to a respective end portion of said second cross member, and a pair of transversely spaced, resilient mounting connections between respective opposite ends of said channel-shaped member and said sill members, said resilient mounting connections being longitudinally spaced between said first and second pairs of links.

---



2,769,657
**MOTOR VEHICLE WINDOW MOUNTING WITH DRAINAGE TROUGH**
George R. Frie, Fort Wayne, Ind., Richard E. McGonigal, Springfield, Ohio, and Louis M. Reukert, Birmingham, Mich., assignors to International Harvester Company, a corporation of New Jersey
Application November 4, 1953, Serial No. 390,126
10 Claims. (Cl. 296—67)

1. In a vehicle body, a body panel having a window opening defined by an inwardly projecting flange; a window frame including top, bottom, and side members secured to said body panel, said bottom member being substantially U-shaped in section and having one leg thereof abutting and secured to said flange, said frame further including an elongated, perforated element having an inverted channel shape in section supported on the web of said bottom member whereby the webs of said member and element are vertically spaced from each other and define the lower and upper walls, respectively, of a trough; a resilient sealing strip seated in said window frame having an outwardly facing groove for receiving said flange, a section of the outer peripheral surface of said strip being adapted to abut the upper wall of said trough, said strip section being confined by and between the legs of said bottom member, said sealing strip further having a pair of inwardly facing grooves formed in the inner periphery thereof arranged in spaced parallel planes for supporting a pair of relatively slidable window panes, said strip section having a plurality of passages formed therein extending from one of said inwardly facing grooves to the outer peripheral surface of said strip section, said passages being registerable with perforations in said top wall of said trough; and conduit means leading from said trough to a point exteriorly of the vehicle body.

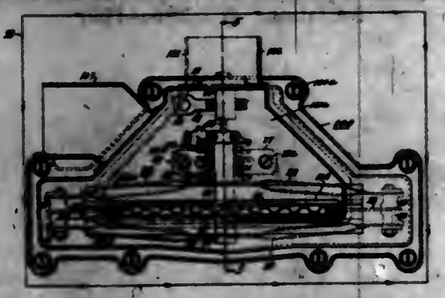
---

2,769,658
**COMBINATION CONVERTIBLE TOP AND EXPANSIBLE VEHICLE BODY**
Harry G. Edmonds, Sr., Oregon City, Oreg., assignor to National Weather-Top Corporation, Tacoma, Wash.
Application September 8, 1953, Serial No. 379,626
3 Claims. (Cl. 296—100)

2. A body of the character described comprising in combination two sections of inverted L-shape in cross-section hingedly attached at their sides to a support along lines diverging toward one end of the body, a wall carried by the support at said one end of the body and embraced by said sections when in a closed position, actuating mechanism for opening and closing said sections, said mechanism comprising in combination, a unitary lever and crank arm pivotally attached to one of said sections, a link pivotally attached at one of its ends to one end of said crank arm above, and curved beneath, said pivotal attachment of the lever and crank arm and pivotally attached at its opposite end to the other of said sections, a second link pivotally attached at one of its ends to said crank arm and at its opposite end to said wall whereby movement of the lever and crank arm in one direction through the medium of the first mentioned link will swing said sections from a closed to an open position and in symmetrical relationship to each other through the medium of said second link, and whereby movement of the lever and crank arm in an opposite direction will similarly swing the sections together into sprung engagement with each other into a closed position and lock them in a closed position by the over center tension of the first mentioned link.

---

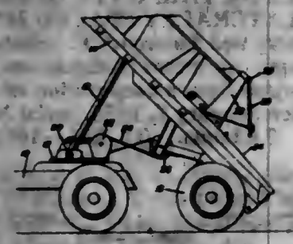
2,769,659
**STABILIZER FOR TAIL GATE DOORS MOUNTED ON LATERALLY SPACED HINGES**
Thomas W. Perry and Lawrence P. Schubert, South Bend, Ind., assignors, by mesne assignments, to Studebaker-Packard Corporation, a corporation of Michigan
Application January 7, 1954, Serial No. 402,790
7 Claims. (Cl. 296—106)



7. A vehicle having a doorway defined by a frame member, a complementary door member for said doorway, said door member being hinged for movement about a generally horizontal axis from a closed position to an open position, a cable having a midportion thereof fixedly attached to one of said members and the end portions thereof threaded through openings on opposite sides of the other of said members, and abutment means attached to each end of said cable to limit and prevent the withdrawal of the ends of said cable through said openings,

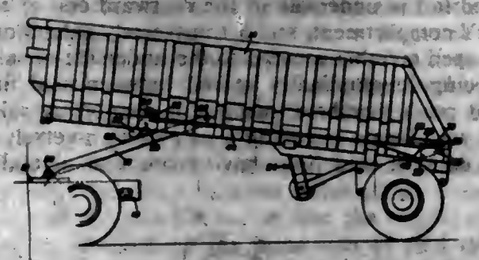
said abutment means being positioned to effect tensioning of said cable when said door member is moved to a predetermined open position.

---



2,769,660
THERMOSTAT
John Dolza, Davisburg, and William K. Steinhagen, and Ralph S. Johnson, Royal Oak, Mich., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application September 15, 1951, Serial No. 246,852
2 Claims. (Cl. 297—12)

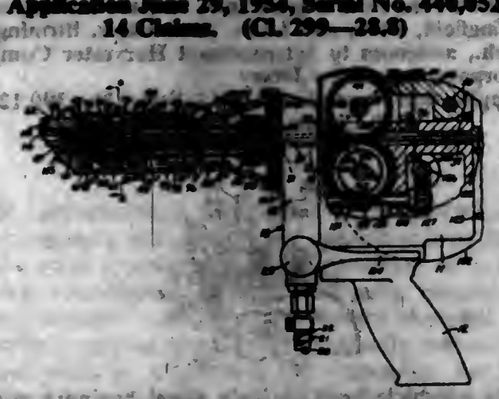
1. Apparatus for sensing the temperature of a gaseous medium comprising a thermostat including spaced, parallel strips of metal having relatively high temperature coefficient of expansion, and said strips being movable in response to variations in temperature of the gaseous medium, plates parallel to the strips and spaced therefrom, a moveable member and means for causing movement of the member in accordance with changes in length of the strips, a housing enclosing the thermostat having a chamber into which the gaseous medium is introduced and a second chamber through which the gaseous medium flows after passing the thermostat, a partition separating said chambers and supporting said plates, said partition having an opening communicating with the space between said plates in which the thermostatic strips are positioned, a conduit supplying the gaseous medium to said first chamber so that said medium can flow into the space between said plates and into the second chamber, a conduit for conducting the gaseous medium away from said second chamber after it has passed between said plates, and a motion transmitting mechanism operatively connected with the movable member.



---

2,769,661
TAIL GATE, APRON AND AXLE PLACEMENT CONSTRUCTION FOR DUMP TRAILERS
Edwin A. Schoenrock, San Angelo, Tex.
Application June 29, 1953, Serial No. 364,788
5 Claims. (Cl. 298—20)

1. A dump trailer comprising a chassis and a rear axle assembly therefor, a body on said chassis, a tail gate assembly for said body, said body and said tail gate assembly being each disposed forwardly of said rear axle assembly whereby to locate the entire load of the body forwardly of the rear axle assembly, said chassis being mounted upon said rear axle assembly for vertical tilting movement thereabout between a substantially horizontal load carrying position and a sharply inclined dumping position, said chassis having an apron extending from the tail gate assembly rearwardly of the rear axle assembly.



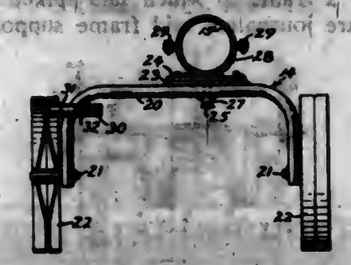
2,769,662
TAIL GATE AND OPERATING DEVICE FOR DUMP OR TRAILER TRUCKS
Edwin A. Schoenrock, San Angelo, Tex.
Application August 21, 1952, Serial No. 305,573
10 Claims. (Cl. 298—23)

1. A truck trailer having a dump body, means for tilting said body into dumping position, a tail gate hinged to the rear end of said body and movable between an upwardly and rearwardly inclined load supporting closed position and a lowered dumping position, means actuated by said tilting means for positively moving said tailgate into closed position when said dump body has moved to a predetermined lowered position, said last means comprising a bell crank pivoted to said dump body intermediate its ends, means connecting one end of said bell crank to said tail gate and means connecting the other end of said bell crank to said tilting means, said tilting means including a lift arm pivotally connected to said dump body.

---

2,769,663
APPARATUS FOR COATING ARTICLES WITH REFRACTORY OXIDES AND THE LIKE
Louis Peter Jensen, Worcester, and William Maxwell Wheildon, Jr., Framingham Center, Mass., assignors to Norton Company, Worcester, Mass., a corporation of Massachusetts
Application June 29, 1954, Serial No. 440,852
14 Claims. (Cl. 299—28.8)

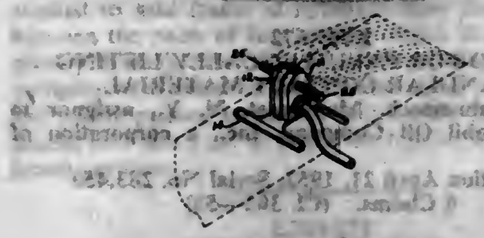
14. Apparatus for fusing and atomizing relatively inflexible oxide rods comprising a casing, rod feeding means in the casing, a nozzle, a tube like barrel to conduct air under pressure to the nozzle to produce a blast, a deflector in the nozzle to deflect the air, said barrel having channels to conduct gases of combustion to said nozzle, said barrel having a channel for the rods, and a rod gripper to restrain the rods which have been advanced out of contact with the feeding means from ejection by the blast, the barrel connecting the casing and the rod gripper which is adjacent the nozzle.



---

2,769,664
APPARATUS TO AID THE MOVING OF PIPE LINES
Gail Cornelius, Portland, Oreg., assignor to R. M. Wade & Co., Portland, Oreg., a corporation of Oregon
Application August 31, 1953, Serial No. 377,415
4 Claims. (Cl. 299—47)

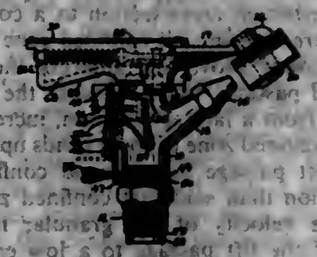
1. A caster for supporting a moveable pipe line which comprises a frame with ground engaging wheels adja-



cent its opposite ends, a pivotal support on the frame for a pipe line to be moved, and frictional brake means tending to retard the rolling of one wheel more than the

other whereby upon movement of the pipe the frame will pivot relative to the pipe and assume a diagonal position with respect thereto.

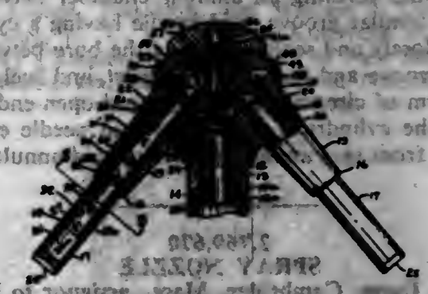
---



2,769,665
OSCILLATING SPRINKLER
Donald L. Spender, Wolcott, Conn., assignor to Scovill Manufacturing Company, Waterbury, Conn., a corporation of Connecticut
Application February 15, 1954, Serial No. 410,217
3 Claims. (Cl. 299—67)

1. A sprinkler comprising a hollow casing, a hollow shaft journaled in and extending through opposite walls of said casing, said shaft having an opening leading to the interior of the casing, a discharge nozzle on one end of said shaft, an impeller wheel within the casing, means directing a stream of water against the impeller wheel to rotate the same, a gear rack member attached to said shaft within said casing and transversely of the axis of said nozzle, and a gear train connecting said impeller wheel to said rack member including a gear meshing with the rack, said rack member being of such shape that upon rotation of said impeller wheel an oscillating movement of uniform rate throughout is imparted to said nozzle.

---



2,769,666
IMPULSE OPERATED SPRINKLER
Donald L. Spender, Wolcott, Conn., assignor to Scovill Manufacturing Company, Waterbury, Conn., a corporation of Connecticut
Application February 1, 1954, Serial No. 407,233
4 Claims. (Cl. 299—69)

1. A sprinkler of the intermittent reversible rotary type comprising a support, a sprinkler head rotatably mounted on said support, a discharge nozzle projecting upwardly and laterally from said head, an impulse arm pivoted coaxially on said sprinkler head, a water deflector vane mounted on the end of the arm in line with the stream issuing from said nozzle and serving to swing said arm alternately to opposite sides of said stream, spring means for returning said arm to neutral position in line with said nozzle after each oscillating movement, a yoke pivotally mounted on the side of said sprinkler head on an axis perpendicular to the axis of the head and having stop means projecting therefrom on opposite sides of said head, one of said stop means being located in the path of a portion of said impulse arm when said yoke is in one position while the other of said stop means is out of the path of said arm, and means for moving said yoke at a predetermined point in the rotation of the sprinkler head to its opposite position where the position of the respective stop means is reversed to effect a change in the direction of rotation of the sprinkler head, and means on said sprinkler head for directly backing up each of said stop means whereby any impact of said impulse arm against the stop means is transmitted to the head without being absorbed by the mounting of the yoke member.

---

2,769,667
REACTION TYPE SPRINKLERS
Donald L. Spender, Wolcott, Conn., assignor to Scovill Manufacturing Company, Waterbury, Conn., a corporation of Connecticut
Application July 22, 1954, Serial No. 445,100
7 Claims. (Cl. 299—69)

1. A sprinkler having a head mounted to rotate about a vertical axis, tubular nozzles fixedly mounted on the head at opposite sides of said axis, each nozzle arranged so that its longitudinal axis is in acute angle relation to said vertical axis, a series of orifices of different size in each nozzle spaced lengthwise of the nozzle and arranged in differing angular relation about the nozzle axis, the angle of elevation of the larger of said orifices being such as to provide a maximum range of jet delivery, while the angle of elevation of the other orifices is progressively smaller to provide progressively lower ranges of jet delivery, the larger of said orifices being in substantially a vertical plane passing through the axes of the head and nozzle and the others of said orifices being arranged at progressively larger angles about the nozzle axis to one side of said plane as they diminish in size, and control means inside said tubular nozzle for progressively opening or closing said orifices to control the range of water distribution.

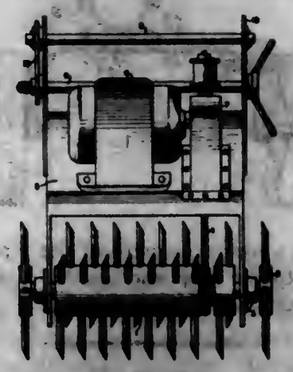
---

2,769,668
IRRIGATION TUBES
Lorenzo A. Richards, Riverside, Calif.
Application October 11, 1954, Serial No. 461,383
4 Claims. (Cl. 299—104)

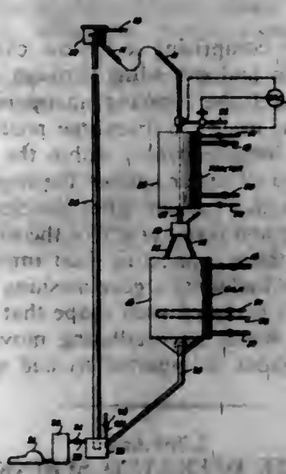
2. An irrigation tube comprising: a length of rubber-like tubing; and multiple fiber yarn strands threaded transversely through the walls of the tubing to form water seepage passages therethrough.

2,769,669
NEEDLE NOZZLE FOR INTERNAL COMBUSTION ENGINES
Rudolf L'Orange, Gisslon, near Frauendenstadt, Germany
Original application October 29, 1951, Serial No. 253,656, now Patent No. 2,743,961, dated May 1, 1956. Divided and this application July 5, 1955, Serial No. 520,010
3 Claims. (Cl. 299—107.6)

1. A fuel injection nozzle for internal combustion engines, comprising a guide having a cylindrical bore communicating at one end with a fuel atomizing port and having a fuel intake port in the form of an annular groove in and surrounding said bore in spaced relationship to the atomizing port axially of said bore, a needle having a sliding fit in said bore, a reduced part on said needle engageable with an annular seat surrounding the atomizing port and forming an annular chamber between said seat and annular groove, said needle having a cylindrical portion closely and sealingly fitting the bore between said annular groove and fuel atomizing port, and fuel passages in the form of circumferentially spaced open-ended bores through the cylindrical portion of said needle extending obliquely from said annular groove to said annular chamber.



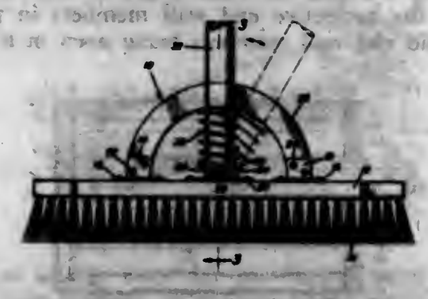
2,769,670
SPRAY NOZZLE
Byron B. Dunn, Cambridge, Mass., assignor to National Gunite Corporation, Boston, Mass., a corporation of Massachusetts
Application September 3, 1953, Serial No. 378,199
1 Claim. (Cl. 299—140)



A spray nozzle for viscous, semi-liquid and aggregate-containing materials, comprising an inner air conducting pipe of uniform bore throughout and having an open nozzle end, a larger outer pipe concentrically surrounding the inner pipe and providing a material feeding chamber therebetween, the outer pipe having an open nozzle end disposed rearwardly of the nozzle end of the inner pipe, and a nozzle having a rear cylindrical portion larger than and threaded to the nozzle end of the outer pipe and a conical portion tapered inwardly-forwardly therefrom about the nozzle end of the inner pipe to a bore diameter approximating that of the inner pipe, the nozzle end of the inner pipe terminating in a rim having an outer annular edge making an angle directed toward said conical portion of the nozzle and adapted to make annular line contact therewith and tightly close the nozzle end of said chamber when the nozzle is threaded rearwardly on the outer pipe into contact with the inner pipe.

2,769,671
MECHANICAL BAGASSE LOOSENER AND PNEUMATIC PICKER
Francisco Lucas Muñiz, San Juan, Puerto Rico
Application January 15, 1954, Serial No. 404,288
2 Claims. (Cl. 302—38)

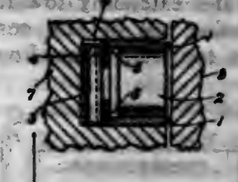
1. In a pneumatic conveying system, a machine for loosening and picking up hard packed bagasse or any other light material, comprising a revolving spiked tooth drum with outboard side clearing wheels, means for driving said spiked tooth drum and side wheels backward and forward, a frame to which said spiked tooth drum and wheels are journaled, said frame supporting a hollow portion having inlet means positioned to pick up material loosened by the said spiked tooth drum, said hollow portion serving as a pneumatic box, means to connect a flexible suction pipe to the hollow portion, and means for attaching the machine to a crane's boom.



2,769,672
METHOD FOR PNEUMATICALLY LIFTING GRANULAR CONTACT MATERIAL
Frank C. Fahnestock, Manhasset, N. Y., assignor to Socony Mobil Oil Company, Inc., a corporation of New York
Application April 21, 1952, Serial No. 283,453
6 Claims. (Cl. 302—53)

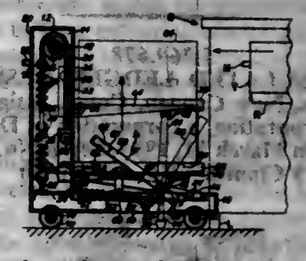
1. An improved method of lifting granular contact material which comprises: gravitating contact material downwardly as a substantially compact gravitating mass in a supply zone, withdrawing contact material downwardly from the bottom of the supply zone through an elongated passage of restricted cross-section to a confined zone, as long as the pressure in said confined zone is low, baffling the flow of solids above and adjacent the upper end of the elongated passage, so as to cause the solids to enter said passage from a lateral direction, increasing the pressure in said confined zone to force solids upwardly through a confined lift passage to a second confined zone at a higher elevation than said first confined zone, restricting the discharge velocity of the granular material at the upper end of the lift passage to a low enough value to maintain the material in compact flowing condition, reducing the pressure in said first confined zone before the first zone is entirely empty, whereby the lift passage remains filled with a substantially compact column of granular material and the first confined zone is refilled, and transferring solids from said second confined zone to provide space for the next slug of contact material.

2,769,673
WALL AND CEILING CLEANER
Patricio Valverde, Sr., Albuquerque, N. Mex.
Application January 19, 1954, Serial No. 404,966
1 Claim. (Cl. 306—11)



In a wall and ceiling cleaner, an elongated oval body member forming an open frame adapted to form a brush back, pairs of right angled lugs fixed to opposite sides of the frame at opposite sides of its transverse center, a semi-circular quadrant upstanding from said frame and having its ends fixed between the lugs of the pairs, a handle having a longitudinal slot through which said quadrant extends and also having an inner end provided with a transverse pivot pin fixed thereto, a pair of strap members secured to said frame at opposite sides thereof midway between the pairs of lugs and in which the ends of the pivot pin are journaled in the axis of said quadrant for swinging adjustment of said handle along said quadrant, and spring pressed means on said handle frictionally engaging said quadrant to retain the handle in different adjusted positions.

2,769,674
ROLLER BEARINGS
Karl Neuffer, Kouts, Ind.
Application August 29, 1952, Serial No. 307,046
2 Claims. (Cl. 308—183)

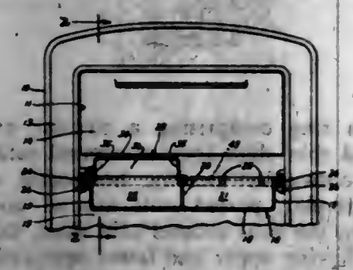


1. In combination: a support provided with an opening defining an interaal raceway having an axially extending cylindrical surface, an outer race ring disposed within the confines of the opening, said ring comprising a one-piece body provided with an external raceway defined by an annular axially extending base portion and a pair of substantially parallel outwardly extending radial side walls, the outer free marginal edge portions of the side walls having inturned corresponding flanges, roller bearings seated in and secured in said external raceway by said inturned flanges and engaging the cylindrical surface of said support, the inner side of the base portion of said ring being provided with a pair of corresponding parallel grooves, a one-piece inner race ring disposed within the confines of the outer race ring, the outer side of said inner race ring being provided with a pair of grooves substantially corresponding to the first mentioned pair of grooves, ball bearings seated in the pairs of grooves, and inwardly extending radial means carried by the support located on opposite sides of the side walls of the outer ring for limiting axial movement of the latter in the opening.

2,769,675
PISTON RING OIL SEALING STRUCTURE
Douglas W. Hansen, Muskegon, Mich., assignor to Muskegon Piston Ring Company, Muskegon, Mich., a corporation of Michigan
Application November 26, 1954, Serial No. 471,241
3 Claims. (Cl. 309—44)

1. A piston ring comprising a circular expander, a circular parted thin shim located around said expander and pressed outwardly thereby, horizontal upper and lower thin, circular, parted rails around said shim, a spacer between the rails around said shim, said shim at its outer side having upper and lower oppositely inclined continuous annular surfaces, located in planes at acute angles to the vertical plane of said shim, against which surfaces the inner edges of said rails bear.

2,769,676
ELEVATING AND LOWERING DEVICE
Carl H. Larsen, Brooklyn, and William J. Gibbs, East Rockaway, N. Y., assignors to American Machine & Foundry Company, a corporation of New Jersey
Application December 21, 1951, Serial No. 262,726
9 Claims. (Cl. 312—306)

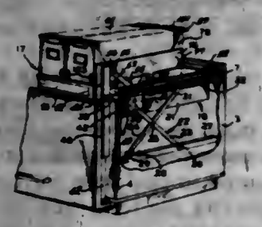


1. A two-level storing and dispensing apparatus comprising, a base, an upright extending upwardly from said base, a cantilever material supporting platform mounted for up and down movement on said upright, calibrated tension springs secured to said base for counterbalancing said material supporting platform and the material supported thereon, means interconnecting the other end of said calibrated tension springs with said carrier platform to effect said counterbalancing action, a lever arm pivoted on said base for engaging with the bottom portion of said material supporting platform to positively change the height of said platform above said base, manual means for swinging said lever arm about said pivot to change the position of said material supporting platform, an extension extending from said lever arm and engaging with the floor when said lever arm is in substantially vertical position to provide a rigid support extending from the bottom of said platform to the floor to lock said platform in elevated position, and a calibrated spring for urging a portion of said lever arm against said platform to exert an upward force thereon.

2,769,677
SLIDING MEAT KEEPER
Iber C. Courson, Glendale, and Raymond A. Mason and Harold C. Grunditch, Philadelphia, Pa., assignors to Philco Corporation, Philadelphia, Pa., a corporation of Pennsylvania
Application March 10, 1954, Serial No. 415,382
3 Claims. (Cl. 312—306)

1. A chiller-drawer for refrigerator cabinets, said drawer comprising; a tray having a bottom wall, up-

standing side walls, and an intermediate wall, defining a two compartment open-topped tray, said tray also including a pair of upper and lower channel forming flanges, extending inwardly from adjacent the top edge of one of said side walls, the upper flange being shorter at the front than the lower flange, and a second and similar pair of flanges positioned adjacent the top edge of said intermediate wall and extending toward said first pair; and a cover enclosing one of said compartments, said cover comprising a top wall, depending side walls, and



a discontinuous flange extending outwardly from each of opposing side walls thereof, the front portion of each of said cover flanges being lower than the remaining portion, its lower flange portions, when said cover is assembled with said tray, resting upon the lower tray flanges and its upper flange portions resting upon the upper tray flanges, thereby slidably supporting said cover over said one compartment in a manner whereby the lower portion of said cover flange passes between said tray flanges to retain said cover engaged with said tray when said cover is moved rearwardly relative to said tray.

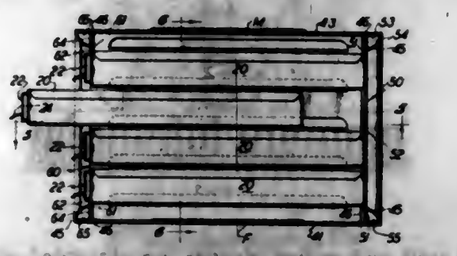
---

**2,769,678**

## INSULATED LEDGER DESK

**Carl F. Wolters, New Canaan, Conn., assignor to Sperry Rand Corporation, a corporation of Delaware**
**Application March 31, 1953, Serial No. 345,928**
**3 Claims. (Cl. 312—310)**

3. A file, comprising a cabinet formed to provide a compartment open at the upper end, a tray mounted for movement in said compartment to and from said open upper end, a closure for the open upper end of said compartment, means for supporting said cover for movement between closed and an open position adjacent the front wall of said cabinet having a supporting member attached to each side of said cabinet, a pivoted member on the front end of each supporting member attached to said cover and lever means connected at opposite ends to said supporting member and pivoted member respectively, and means connecting an intermediate portion of said lever means to said tray, whereby movement of said cover to open position will operate said lever means to move said tray to the upper end of said cabinet.



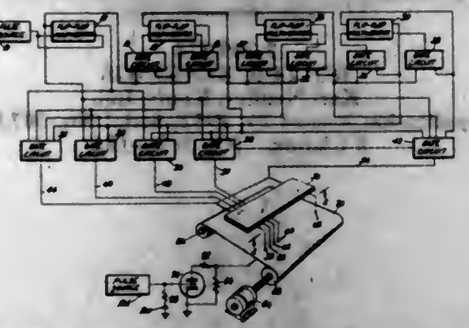
---

**2,769,679**

## FILE CABINETS

**Joseph H. Wineman, Los Angeles, Calif.**
**Application October 19, 1951, Serial No. 252,039**
**6 Claims. (Cl. 312—350)**

1. In a file cabinet, a rectangular case comprising four walls arranged to embrace a central space and molding strips extending into said space from the open ends of the case, the inner edges of the molding strips projecting axially inwardly, a pair of unitary rectangular end wall members arranged at opposite ends of said central space, both end wall members having inwardly stepped offset portions at positions spaced inwardly from the edges thereof for abutting the inner edges of said strips for retaining the respective end wall members in position, one of said end wall members being open in the space



between said offset portions to provide a drawer-receiving mouth at one end of the cabinet, and a pair of side-wall members, mounted on opposite sides of said central space, said side-wall members being secured to said end wall members, said side-wall members having inwardly projecting shelf-support strips formed integrally therewith.

---

**2,769,680**

## GRAPH PLOTTER

**Robert M. Beck, Inglewood, Calif., assignor to Northrop Aircraft, Incorporated, Hawthorne, Calif., a corporation of California**
**Application June 11, 1953, Serial No. 361,027**
**8 Claims. (Cl. 346—49)**

1. A graph plotter, including, means for providing digital increments in a first quantity, means for providing a count of digital increments in a second quantity related to the first quantity, an electrosensitive paper, a plurality of terminals disposed in contiguous relationship to the paper, each of the terminals being connected to the counting means to become energized upon a count representing a different integer so as to produce a mark upon the paper, and means for producing a change in the intensity of the marks provided by the terminals upon each digital increment in the first quantity.

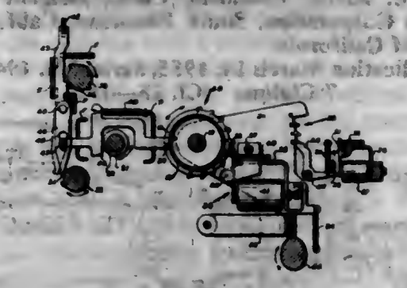
**2,769,681**

## RECORDING AND MEASURING INSTRUMENT

**James E. Bevins, Ramsey, and Robert W. Hyde, Englewood, N. J., assignors to Bendix Aviation Corporation, Teterboro, N. J., a corporation of Delaware**
**Original application April 16, 1945, Serial No. 588,600. Divided and this application October 27, 1951, Serial No. 254,136**
**3 Claims. (Cl. 346—78)**

1. In a recording machine of the character described including a continuously vertically moving tape, a print ribbon continuously moving laterally over the face of the tape and in close spaced relation thereto, a print element, a platen continuously operating at close intervals to push the moving tape and print ribbon momentarily into contact with the print element to produce a visible impression on the tape, a pair of electrical synchros connected in an electrical circuit as a transmitter and a receiver of the transmitted signals, a cord carrying the print element fixed thereto, the receiving synchro including a rotor shaft, and carriage means operatively



connected to the rotor for moving the cord and connected print element to various lateral positions across the face of the tape in response to signals received from the transmitter.

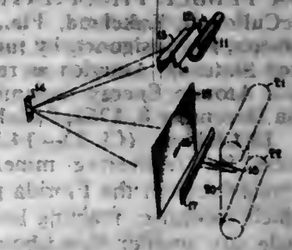
**2,769,682**

## CONTROL MECHANISMS FOR PRINTING MACHINES

**Alexander A. Solla, Queens Village, N. Y., assignor to Burroughs Corporation, Detroit, Mich., a corporation of Michigan**
**Application September 16, 1953, Serial No. 380,462**
**6 Claims. (Cl. 346—98)**



4. In a recording machine including a plurality of recording elements operable in selected combinations to record various characters, a device for selecting said combinations of recording elements comprising a drive shaft, means to rotate said drive shaft, a rotatable member resiliently connected to said drive shaft and rotatable thereon, said rotatable member having engageable means effective in various positions of said rotatable member to select for recording different combinations of said recording elements, stop means on said rotatable member having a series of stop elements arranged in a given position with respect to said engageable means, a second member rotatable about the axis of said drive shaft and having an engageable sector with a series of stop elements arranged in a given position thereon, arresting means on said second member for selectively engaging said stop elements on said rotatable member, means for causing said second member to rotate, second arresting means for selectively engaging said stop elements on said engageable sector thereby to position said second member, selecting members connected respectively to said recording elements and adapted for engagement with said engageable means on said rotatable member, and means for bringing said selecting members into and out of engagement with said engageable means on said rotatable member.

**2,769,683**

## VARIABLE DENSITY RECORDING OF GALVANOMETER MOTION

**Jesse D. Skelton, Tulsa, Okla., assignor to Esso Research and Engineering Company, a corporation of Delaware**
**Application November 1, 1951, Serial No. 254,331**
**6 Claims. (Cl. 346—109)**

1. An apparatus for making a photographic record of an electrical transient which comprises in combination a line source of light; a reflecting mirror galvanometer with its mirror rotationally responsive to said transient; a light barrier provided with an aperture adapted to pass light through the barrier; said source, said reflecting mirror and said barrier being spaced from one another and arranged such that a substantially line-shaped image of the light source is reflected by the mirror to the barrier and such that rotational movements of the mirror cause different portions of the reflected image to pass through the aperture; a light filter having a progressively different light transmission along its length; said filter being positioned in the light path from the light source to the mirror and arranged such that the image on the barrier varies progressively in light intensity along its length; a photosensitive medium positioned adjacent said barrier such that light passing through the aperture in the barrier impinges upon said medium; and means for moving said medium relative to said aperture.

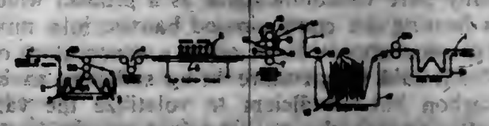
## PROCESS FOR STRIPPING AND LIGHTENING WOOL DYEINGS



**Wilhelm Geigy, Binningen, Otto Albrecht, Neuewelt, near Basel, and Jules Meyer, Basel, Switzerland, assignors to Ciba Limited, Basel, Switzerland, a Swiss firm**
**No Drawing. Application February 24, 1953, Serial No. 338,625**
**Claims priority, application Switzerland December 10, 1952**
**11 Claims. (Cl. 8—102)**

1. A process for lightening and stripping dyeings of wool dyestuffs on basic nitrogenous fibers, which consists in contacting the dyed material with a condensation product selected from the group consisting of condensation products of at least 4 mols of an $\alpha,\beta$-alkylene oxide and one mol of a primary amine which contains a hydrocarbon radical with at least 10 carbon atoms and water-soluble salts of such condensation products.

**2,769,685**

## TREATMENT OF COTTON FABRICS TO INCREASE THEIR LUSTRE BY APPLYING MERCERIZING CAUSTIC SODA AND HEAVY PRESSURE

**Roderick J. Cowles, Needham, Mass., and Nicholas A. Clemmamos, Troy, N. Y., assignors to Cluett, Peabody & Co., Inc., New York, N. Y., a corporation of New York**
**Application May 10, 1952, Serial No. 287,084**
**4 Claims. (Cl. 8—125)**

1. The method of treating a fabric containing largely cotton textile fibers to impart thereto an increased lustre that is permanent to multiple washes, which method comprises wetting said fabric with an aqueous solution of

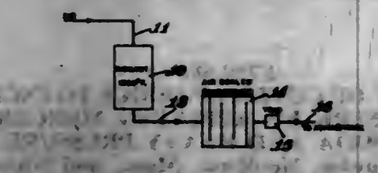
caustic soda of mercerizing strength until the cotton fibers thereof are plastic and swelled, holding said treated fabric under the tension commonly used in mercerization to resist shrinkage, rinsing the held fabric with water at a temperature below about 105° F. until said fabric largely relaxes its tension and the caustic soda content of the cotton fibers is reduced below about 3½ percent and not fully removed and cellulose hydrate II is produced, immediately thereafter permanently flattening the swelled cotton fibers by heavy pressure thereon in a direction approximately normal to the faces of said fabric, immediately after the flattening step setting the cotton fibers in flattened condition by changing said cellulose hydrate II to cellulose hydrate I, immediately after changing cellulose hydrate II to cellulose hydrate I removing all of the remaining caustic soda from the flattened fibers.

2,769,686

**RECOVERY OF MINERAL VALUES FROM LEACHED ZONE MATERIAL OVERLYING FLORIDA PEBBLE PHOSPHATE DEPOSITS**

Robert F. McCullough, Lakeland, Fla., and Ira M. Le Baron, Evanston, Ill., assignors, by mesne assignments, to the United States of America as represented by the United States Atomic Energy Commission

Application December 8, 1952, Serial No. 324,632
13 Claims. (Cl. 23—14.5)



13. A process for recovering mineral values from leached zone material from the Florida pebble phosphate overburden which comprises reacting leached zone material of a particle size smaller than about 150 mesh with sulfuric acid of a concentration between about 20% and about 55% sulfuric acid in an amount of between about 55% and about 105% of the amount required to react with all of the constituents capable of reacting with sulfuric acid, separating insoluble material from aqueous solution of reaction products, treating the aqueous solution with an amount of sulfate of ammonia sufficient to crystallize a major portion of the aluminum as ammonium alum, separating the alum crystals from the aqueous medium and separately recovering from the resultant aqueous solution uranium and phosphorus values.

2,769,687

**PROCESS FOR THE RECOVERY OF VANADIUM FROM CARBON- AND VANADIUM-CONTAMINATED CATALYSTS**

Frederick William Bertram Porter and Roy Purdy Northcott, Sunbury-on-Thames, England, assignors to The British Petroleum Company Limited

Application December 24, 1952, Serial No. 327,802
Claims priority, application Great Britain January 1, 1952
1 Claim. (Cl. 23—140)

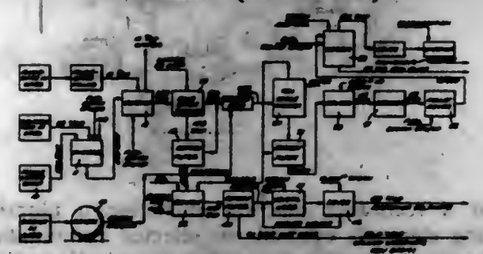
A process for regenerating bauxite contaminated with carbon and vanadium to restore its activity for use in the removal of vanadium from petroleum products and to recover the vanadium contaminant in the form of substantially pure vanadium oxide as a product which comprises heating the contaminated bauxite in a mixture of inert gas and about 5% of air at a temperature of about 1000° F., said temperature being sufficient to burn off the carbon but insufficient to volatilize the vanadium, thereafter heating the de-carbonized bauxite in the presence of air alone at a temperature of about 1300° F. to volatilize the vanadium in the form of its oxide and obtain re-activated bauxite as a desired product, and cooling the resulting vanadium oxide-containing air out of contact with the re-activated bauxite to recover the vanadium oxide in a substantially pure form as an additional desired product.

2,769,688

**LOW SODIUM CATALYST SUPPORT**

Thomas H. Milliken, Jr., Moylan, Pa., and David W. Koester, Claymont, Del., assignors to Houdry Process Corporation, Wilmington, Del., a corporation of Delaware

No Drawing. Application February 26, 1952, Serial No. 273,558
5 Claims. (Cl. 23—143)



1. The method of producing refined activated alumina of relatively low sodium content for catalytic purposes which comprises calcining aluminum trihydrate at a temperature in the range of about 800 to 1050° F., leaching the calcined alumina with a dilute solution of a mild acidic agent vaporizable at moderate temperatures, separating the acid solution from the leached alumina, drying and heat-treating the dried alumina at a temperature in the range of about 900 to 1400° F.

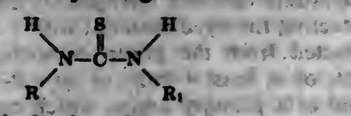
2,769,689

**PROCESS FOR TREATMENT OF WASTE PICKLE LIQUOR**

Gustave E. Kidde, Pasadena, Calif., assignor to Kidde Process Corporation, South Pasadena, Calif., a corporation of California

Application March 14, 1955, Serial No. 494,015
7 Claims. (Cl. 23—153)

1. In a process for the production of valuable products from waste pickle liquor containing ferrous sulfate, the steps comprising oxidizing said ferrous sulfate to form ferric sulfate, reacting the ferric sulfate thus produced with fluorspar to form a mixture of a soluble complex of iron, fluorine and sulfate, and a precipitate of calcium sulfate, separating the calcium sulfate from the mixture, neutralizing said calcium sulfate-free mixture to produce a mixture of an insoluble ferric fluohydroxide, insoluble ferric hydroxide and a solution of a sulfate compound, separating said ferric compounds from said mixture, and subjecting said ferric compounds to a temperature in excess of about 700° C. to produce hydrogen fluoride gas and iron oxide.



2,769,690

**INHIBITING CORROSION OF FERROUS METALS**

John E. Mahan, Bartlesville, Okla., and Robert A. Stahl, Kansas City, Kans., assignors to Phillips Petroleum Company, a corporation of Delaware

No Drawing. Application June 23, 1952, Serial No. 295,118
10 Claims. (Cl. 23—157)

1. A process for reducing the corrosion of ferrous metals by a dilute aqueous nitric acid solution, which comprises incorporating in said acid solution both a compound represented by the general formula

wherein R in a radical selected from the group consisting of hydrogen and alkyl groups containing not to exceed four carbon atoms, and wherein $R_1$ is a radical selected from the group consisting of hydrogen, alkyl groups containing not to exceed four carbon atoms, and a thioamide radical, and wherein R and $R_1$ together form heterocylic ring structures containing up to five members consisting of carbon and nitrogen, said compound containing not more than seven carbon atoms per molecule, and an arsenite selected from the group consisting of sodium arsenite, potassium arsenite, lithium arsenite and ammonium arsenite, in amounts sufficient to decrease the rate of corrosion of a ferrous metal by said acid solution.

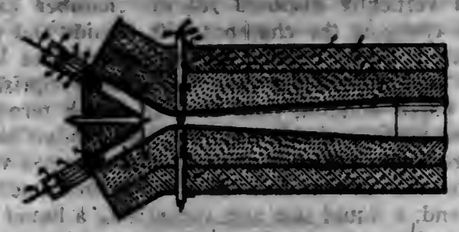
9. As a new composition of matter, a dilute aqueous acid solution containing about 15 weight percent nitric acid and thiourea and sodium arsenite in amounts sufficient to decrease the rate of corrosion of a ferrous metal by said solution.

2,769,691

**PROCESS FOR THE PRODUCTION OF SULPHUR AND HYDROGEN SULPHIDE FROM IRON SULPHIDES**

Pietro Achille, Milan, Italy

No Drawing. Application November 19, 1953, Serial No. 393,227
Claims priority, application Italy September 22, 1953
4 Claims. (Cl. 23—181)



1. A process adapted for the production at room temperature of hydrogen sulphide and sulphur from pyrite which comprises reacting finely ground pyrite suspended in water with chlorine with a molecular ratio of two parts of pyrite to 15 parts of chlorine to form a solution of ferric sulphate, sulphuric acid and hydrochloric acid, the amount of water being insufficient for the complete solubilization of the products obtained, reacting the solution thus obtained with ferrous sulphide to produce hydrogen sulphide and a suspension of sulphur in a solution of ferrous sulphate and ferrous chloride, recovering hydrogen sulphide and separating and recovering sulphur from said suspension.

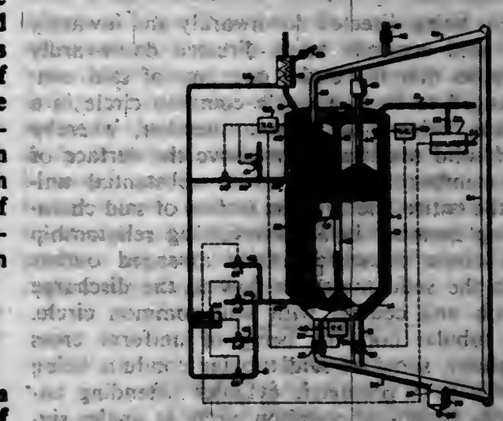
2,769,692

**CARBON BLACK PROCESS AND APPARATUS**

George L. Heller, Monroe, La., assignor to Columbian Carbon Company, New York, N. Y., a corporation of Delaware

Application May 6, 1952, Serial No. 286,370
10 Claims. (Cl. 23—209.4)

1. In the process for producing carbon black by the thermal decomposition of hydrocarbons wherein the hydrocarbon is separately injected into and is rapidly and uniformly mixed with a turbulent stream of hot flame gases passing through an elongated reaction chamber and decomposed by heat absorbed from the hot gases to form carbon black in suspension, the resultant suspension being withdrawn from the downstream end of the reaction chamber, cooled and the carbon black collected, the steps comprising supplying the hot blast flame gases to the reaction chamber as from without the chamber as a plurality of separate high velocity streams, the longitudinal axis of each stream lying in the plane of the longitudinal axis of the chamber and said streams converging toward each other and toward the longitudinal axis of the chamber in a generally downstream direction, the angle of convergence of said separate streams toward each other being within the range of 60° to 120°, and thereby impinging each of said streams upon a like stream as they enter the chamber to form within the chamber a zone of impact and increased turbulence and injecting the hydrocarbon to be decomposed into the said zone to effect rapid and uniform mixing of the hydrocarbon make with the hot gases and passing the resultant mixture in a state of violent turbulence through the elongated reaction chamber.



7. Apparatus for the production of furnace carbons comprising an elongated heat insulated reaction chamber, a plurality of combustion chambers leading into the upstream end of the reaction chamber from opposite sides of said chamber, the longitudinal axis of each of the respective combustion chambers lying in the plane of the longitudinal axis of the reaction chamber and forming an angle of at least 30° but not exceeding 60° with the upstream extension of the longitudinal axis of the reaction chamber, and means for separately injecting hydrocarbon to be decomposed into the upstream end of the reaction chamber at a point near the entrance of the combustion chambers.

2,769,693

**PEBBLE HEAT EXCHANGER**

Louis C. Bearer, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware

Application December 21, 1951, Serial No. 262,757
18 Claims. (Cl. 23—284)

1. Improved pebble heater apparatus comprising in combination a closed, upright, elongated shell; an upright partition within and extending from the bottom to the top of said shell so as to divide the space within said shell into a first chamber on one side of said partition and a second chamber on the other side; gaseous material conduits intermediate the ends of said partition and extending between the two chambers; separate pebble inlet conduit means in the upper end of each chamber, the delivery end of the conduit in said second chamber being at a lower level than the delivery end of the conduit in said first chamber; pebble outlet means in the bottom of each chamber; elevator means connected at its lower end to said pebble outlet means and at its upper end to said pebble inlet means; gaseous material inlet means in the lower end of said first chamber formed within said shell; separate gaseous effluent conduit means extending from the upper end portion of each chamber; and gaseous material inlet means in said first chamber above the level of said gaseous material conduits in said partition.

2,769,694

**SOLIDS WITHDRAWAL UNIT**

Hubert A. Shabaker, Media, Pa., assignor to Houdry Process Corporation, Wilmington, Del., a corporation of Delaware

Application October 1, 1951, Serial No. 249,187
1 Claim. (Cl. 23—284)

Apparatus characterized by substantially uniform flow of solid granular material throughout a zone of large

cross-sectional area and into a small discharge conduit therebeneath, the granular material being metered through tubular conduit outlets circumferentially arranged about a single common circle above said discharge conduit, and said uniform flow being transmitted from said circumferentially arranged outlets through tubular conduits to said large cross-sectional area, said apparatus being adapted for contacting freely flowable solid materials with gaseous fluids and comprising an upright treating chamber having a vertical wall laterally enclosing said chamber, a top closure for said chamber open to the introduction of solid materials therethrough and into said chamber for gravitation of said solid materials through said chamber, a bottom member in said chamber, the upper surface of which forms a temporary support for a bed of solid materials in said chamber, said bottom member having a plurality of downwardly directed tubular conduits associated therewith through which solid materials can be withdrawn from above the surface of said bottom member, said conduits being positioned so that their inlet openings are at the upper surface of said bottom member and are arranged in a plurality of patterns, some

of said conduits being directed downwardly and inwardly and other of said conduits being directed downwardly and outwardly so that the outlet openings of said conduits are arranged to form a single common circle in a horizontal plane below said bottom member, whereby withdrawal of solid material from above the surface of said bottom member is effected with substantial uniformity over the entire lateral cross section of said chamber, a confining member in solids-receiving relationship to the single circle circumferentially arranged outlets through which the solid materials flow to the discharge conduit beneath and coaxial with said common circle, each of said tubular conduits being of uniform cross section throughout, some of said tubular conduits being disposed relative to a geometric cylinder extending coaxially upwardly from said common circle at angles significantly different from the angles of other conduits, baffle means within said collecting means arranged to form barriers which laterally confine the solids discharging from said conduits into separate expanded relatively-shallow compact moving masses, said baffle means directing the flow of said separate masses downwardly into the peripheral region of said collecting means.

**2,769,695**

**ENDOTHERMIC GENERATOR RETORT**

Arthur W. Frank, Delafield, Wis., assignor to Hevi Duty Electric Company, Milwaukee, Wis., a corporation of Wisconsin

Application June 4, 1953, Serial No. 359,571
5 Claims. (Cl. 23—288)

1. In a gas retort a casing, a longitudinally extending cylindrical internal housing within said casing, a retort having a flange on one end thereof, said retort being slidable through said longitudinally extending internal housing with said flange abutting against the end of said casing, an end plate secured over said flange, means securing said end plate and said flange to said casing, an intake pipe extending through said end plate, said retort carrying a cylindrical sleeve at the other end thereof having a diameter less than the internal diameter of said retort, said sleeve projecting downwardly from said retort and terminating in an annular flange at the terminating end thereof, a removable end plate carried by said last-mentioned flange, an outlet pipe mounted centrally of said last-mentioned removable plate, said outlet pipe extending interiorly within the last-mentioned end of said retort in spatial relation to both said sleeve and said retort and a protective baffle support mounted within said sleeve and extending adjacent the internal end of said outlet pipe in spatial relation thereto, a flat protective plate carried by said protective baffle support for restricting the passage of carbon through said outlet pipe, said baffle support providing means for mounting a catalyst intermediate said inlet and outlet pipes.

**2,769,696**

**REACTOR**

Edward E. Littenhous, Nashville, Tenn., assignor to Tennessee Products & Chemical Corporation, Nashville, Tenn., a corporation of Tennessee

Application October 20, 1952, Serial No. 315,740
11 Claims. (Cl. 23—288)

1. An apparatus for reacting liquids with gases comprising: a vertically disposed reactor chamber having means for charging the chamber with liquids and gases to be reacted; liquid heating means adjacent the lower portion of said chamber; a vapor side arm comprising a U-shaped vapor conduit, both ends of which terminate in the upper portion of said chamber, said conduit having a vapor pre-heater adjacent one end, and a heated vapor catalyst chamber intermediate said vapor pre-heater and the other end; a liquid side arm comprising a liquid conduit, one end terminating in the lower portion of said chamber and the opposite end terminating in said vapor side arm intermediate said catalyst chamber and said reactor chamber, said opposite end having a jet nozzle directed toward said reactor chamber; and means for recirculating liquid through said liquid side arm.

---

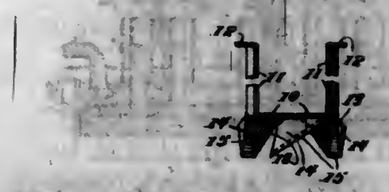
**2,769,697**

**THICKENER FOR HYDROCARBON FUELS**

Jerome Goldenson and Leonard Cohen, Baltimore, Md., assignors to the United States of America as represented by the Secretary of the Army

No Drawing. Application April 29, 1953, Serial No. 352,065
10 Claims. (Cl. 44—7)
(Granted under Title 35, U. S. Code (1952), sec. 266)

1. In the production of an incendiary liquid hydrocarbon fuel gel thickened with an aluminum soap thickener, the improvement which comprises the inclusion therein of alumina aerogel in the proportion of 0.5 to 25 parts by weight of alumina gel, to 99.5 to 75 parts by weight of the soap thickener to stabilize the thickened fuel gel toward the deleterious action of chemical reagents.



---

**2,769,698**

**FUEL MIXER INSERT**

Edwin F. Pauli, Delphos, Kans.

Application May 20, 1952, Serial No. 288,879
3 Claims. (Cl. 48—180)

1. A fuel mixer for use in an inlet passage of the intake of an internal combustion engine comprising radially disposed ribs with arms extended at right angles from extended ends thereof and with flanges extended at right angles from the extended ends of the arms, the ribs and flanges being positioned in spaced parallel planes and vanes substantially triangular shape in elevation and U-shape in cross section extended from edges of the ribs and positioned with one side of each of said vanes secured to one of said ribs providing L-shaped supporting elements, the bottom portions of said vanes being extended at right angles from lower edges of said sides and the opposite sides of the vanes being extended at right angles to extended edges of the bottom portions and positioned in planes spaced from and parallel to the sides secured to the ribs.

---

**2,769,699**

**GRINDING WHEELS**

Frank J. Polch, Princeton, Mass., assignor to Norton Company, Worcester, Mass., a corporation of Massachusetts

No Drawing. Application June 2, 1951, Serial No. 229,647
6 Claims. (Cl. 51—298)

1. A solid abrasive body comprising abrasive grains of grit size from No. 8 to No. 220 of crystalline fused zirconia bonded with thermo-irreversible organic bond selected from the group consisting of phenolic resin, aniline formaldehyde resin, natural rubber vulcanized with at least one third of its weight of sulphur, butadiene-styrene copolymer vulcanized with at least one third of its weight of sulphur, and butadiene-acrylonitrile copolymer vulcanized with at least one third of its weight of sulphur, and mixtures thereof.

---

**2,769,700**

**ONE-STAGE RESIN BONDED DIAMOND ABRASIVE WHEEL**

George J. Goepfert, St. Marys, Pa., assignor to The Carborundum Company, Niagara Falls, N. Y., a corporation of Delaware

No Drawing. Application January 21, 1953, Serial No. 332,499
6 Claims. (Cl. 51—298)

1. The method of making a resin-bonded diamond grinding wheel which comprises making a solid one-step "A" stage resin by reacting phenol and formaldehyde in the proportion of 1 mol phenol to about 1–1.7 mols formaldehyde in the presence of a nitrogen-containing base as a catalyst until a solid resin is formed; grinding the resin to a fine powder; preparing a moldable mixture comprising essentially the resin powder, granular filling material, diamonds, and an alkaline earth oxide catalyst for the powdered resin; forming an article from the mix thus prepared; and heating the article to convert the resin substantially to the "C" stage.

---

**2,769,701**

**COMPOSITIONS FOR USE IN RE-UTILISABLE BLASTING APPARATUS**

John Frederick Williamson, Ardrossan, Scotland, assignor to Imperial Chemical Industries Limited, a corporation of Great Britain

Application October 28, 1953, Serial No. 388,841
Claims priority, application Great Britain December 5, 1952
6 Claims. (Cl. 52—14)

1. A gas-producing charge suitable for use in association with an electrically actuable chemical heating element in a blasting device of the kind in which a gas-producing charge is confined within a pressure resisting shell having a member adapted to permit escape of the gases at a predetermined pressure and an electrically actuable chemical heating element capable of ignition and of generating a gas pressure in the free space in said container comprising a pulverulent intimate admixture comprising ammonium nitrate, at least one of the hydrated nitrates of metals of low atomic weight of the group magnesium nitrate hexahydrate and aluminum nitrate nonahydrate, and a non-explosive organic fuel consisting substantially of a dried vegetable carbohydrate material, wherein the number of moles of combined water in the metal nitrate per mole of ammonium nitrate lies between 1 and 3 and wherein the proportion of the organic fuel in the pulverulent mixture is such that the gases from the charge and said heating element consist at the bursting pressure of said blasting device substantially of steam, carbon dioxide and nitrogen.

---

**2,769,702**

**HERBICIDAL COMPOSITION**

Frank J. Sowa, Cranford, N. J.

No Drawing. Application February 9, 1952, Serial No. 270,901
14 Claims. (Cl. 71—2.2)

1. An herbicidal composition comprising a compound selected from the group consisting of the ammonium and amine salts of fluosilicic acid in phytotoxic concentration, said composition containing sufficient non-ionic wetting agent to impart to an aqueous solution of the composition containing from 3 to 15% of said compound a surface tension below about 50 dynes per centimeter at 23° C.

---

**2,769,703**

**METHOD OF PRODUCING PHOSPHATE FERTILIZERS**

Louis E. Andrès, Saint Gratien, and Yves J. Berquin, Paris, France, assignors to Potasse & Engrais Chimiques, Paris, France, a société anonyme of France

No Drawing. Application January 18, 1956, Serial No. 559,789
Claims priority, application France August 31, 1951
11 Claims. (Cl. 71—39)

1. In a process of manufacturing a phosphate fertilizer in which natural phosphate rock containing calcium phosphate is reacted with nitric acid and there is added a neutralizing agent to the mixture of said phosphate rock and nitric acid, the method of completely neutralizing the mixture and preventing the formation in the reaction product of said phosphate rock, nitric acid and neutralizing agent of calcium phosphate in a form which is insoluble in ammonium citrate which comprises the

steps of adding the neutralizing agent to said mixture of phosphate rock and nitric acid in sufficient amount to completely neutralize it and a compound of aluminum in an amount to insure the presence of at least 20 mols of Al to each 100 mols of $P_2O_5$ present in the mixture and adding to said mixture a compound containing sulphate ions to insure the presence of sulphate ions in an amount to convert all calcium nitrate present into calcium sulphate, said aluminum compound being added after said rock phosphate is reacted with said acid and prior to the addition of said neutralizing agent.

---

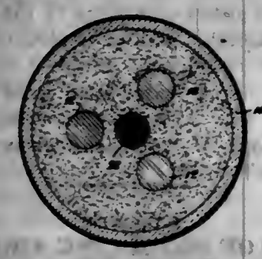
2,769,704

## METHOD OF PRODUCING PHOSPHATE FERTILIZERS

Louis E. Andrés, Saint Gratien, and Pierre G. Pagny, Paris, France, assignors to Potasse & Engrais Chimiques, Paris, France, a société anonyme of France

No Drawing. Application September 24, 1952, Serial No. 311,326
Claims priority, application France October 5, 1951
4 Claims. (Cl. 71—43)

1. In a process for the manufacture of a phosphate fertilizer in which natural phosphate rock is reacted with a mineral acid and there is added a neutralizing agent to the mixture of said phosphate rock and mineral acid the method of preventing the formation in the reaction product of said phosphate rock, mineral acid and neutralizing agent of calcium phosphate in a form which is insoluble in ammonium citrate which comprises the step of adding to the mixture of phosphate rock and mineral acid a compound of iron in an amount to insure the presence of at least 20 mols of Fe to each 100 mols of $P_2O_5$ present in the mixture.



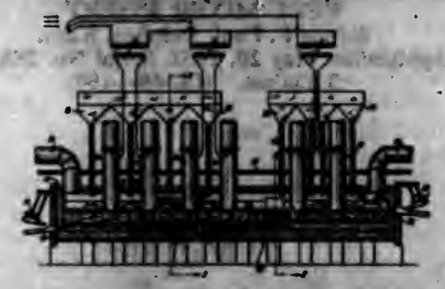
---

2,769,705

## PROCESS OF CHARGING FINE MATERIALS

Mathias Övrom Sem, Smestad, Oslo, Norway, assignor to Elektrokemisk A/S, Oslo, Norway, a corporation of Norway

Application January 9, 1952, Serial No. 265,716
Claims priority, application Norway January 15, 1951
2 Claims. (Cl. 75—10)



1. The method of operating a closed electric smelting furnace for smelting materials of the type illustrated by carbide, ferro-alloys, pig iron and the like, said furnace being of the type in which the electrodes are arranged in a triangle, which comprises screening material to be treated to remove material having a diameter smaller than about 4 mm., charging the material from which such finer material has been removed continuously around the electrodes and charging such finer material into the central zone of the triangle defined by the electrodes so that it is introduced relatively far from the electrodes but spaced from the cooling action of the side walls and melting such finer material relatively slowly in such zone whereby gases are caused to evolve relatively slowly from such finer material to reduce the tendency of such gases to cause eruptions.

2,769,706

## SMELTING SULFIDE ORES

Fritz O. Hernqvist, Allan F. Nouré, and Erik O. A. Sundström, Skellefteåhamn, Sweden, assignors to Boliden Gruvaktiebolag, Skellefteåhamn, Sweden, a Swedish joint-stock company

Application September 29, 1952, Serial No. 312,092
Claims priority, application Sweden June 4, 1948
5 Claims. (Cl. 75—10)

1. In smelting sulphide ores containing at least one metal of the group consisting of copper, gold, silver, nickel and lead for producing a matte; the steps of charging and smelting by means of electrodes in a first zone of an electrode furnace, said sulphide ore containing material producing a matte having a relatively high content of said metal and charging and smelting in a second zone of the same furnace by means of at least one further electrode a material producing a matte having a lower content of the said metal than the matte of the first mentioned zone, the first mentioned zone being established and maintained at a greater distance from the slag discharge point of the furnace than the second zone, and the second zone being established and maintained at a greater distance from the matte discharge point than the first mentioned zone; discharging slag from the furnace at the slag discharge point to cause the slag produced in the first mentioned zone to flow by gravity through the second zone to the slag discharge point, while immersing the said further electrode into the slag in said second zone to a depth such as to cause a violent agitation around said further electrode of substantially all the slag entering the second zone and of matte of said second zone, said agitation causing mixing of said slag and said matte in the form of prills around said further electrode; correlating the distance between the electrode nearest the slag discharge point and said slag discharge point and the rate of flow at which the slag leaves the furnace at said slag discharge point, such as to cause substantially all the matte prills in suspension in the slag to settle at least to a level lower than the slag discharge point before the slag reaches said point; discharging matte from the first mentioned zone from the furnace at the matte discharge point, said matte discharge point being at a lower level than said slag discharge point and therefore causing the matte produced in the second zone to flow by gravity into the matte in the first mentioned zone, thereby substantially preventing the matte produced in the first mentioned zone from enriching the matte produced and present in the second zone.

---

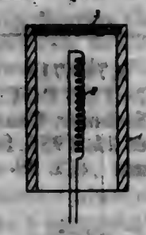
2,769,707

## THERMALLY STABLE BETA ALLOYS OF TITANIUM-TIN ALLOYS

Milton B. Vordahl, Beaver, Pa., assignor to Rem-Cru Titanium, Inc., Midland, Pa., a corporation of Pennsylvania

No Drawing. Application November 1, 1952, Serial No. 318,309
6 Claims. (Cl. 75—175.5)

1. A titanium-base alloy consisting essentially of: about 10 to 20% of at least one beta-promoting element, about 2 to 10% tin, and the balance substantially titanium, characterized by high thermal stability and retention of ductility on aging in the temperature range of about 400 to 800° F.



2,769,708

## THERMIONIC CATHODE AND METHOD OF MAKING THE SAME

Patrick P. Coppola, Dobbs Ferry, Ray C. Hughes, Ardsley, and Otto G. Koppius, White Plains, N. Y., assignors, by mesne assignments, to North American Philips Company, Inc., New York, N. Y., a corporation of Delaware

Application June 11, 1953, Serial No. 361,854
4 Claims. (Cl. 75—206)

1. A method of making a thermionic dispenser cathode comprising the steps, mixing about 90% by weight of a powdered refractory metal and about 10% by weight of a powdered fused mixture of at least 60% by weight of an alkaline earth metal oxide and the remainder principally aluminum oxide, pressing said mixture into a body, and firing said body at a temperature of about 1650° to 1750° C. for about one-half minute to form a coherent composite mass of the refractory metal and said fused mixture free of entrained gas.

---

2,769,709

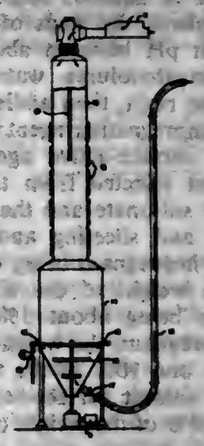
## SINTERED METAL ARTICLE AND METHOD OF IMPROVING ITS FATIGUE RESISTANCE BY SHOT PEENING

Charles Robert Talmage, New Canaan, Conn.

Application January 7, 1953, Serial No. 329,983
2 Claims. (Cl. 75—221)

1. In the process of forming a part of substantially finished shape from powdered metal comprising metal selected from the group consisting of iron, copper and bronze by compressing the metal powder to desired form and then heating it to cause the particles to sinter together, the steps of shot peening the surface of such part and thereby pushing together edges of pores on the surface of such part and thereafter without substantially changing the shape of the part again heating such part to the sintering temperature and sintering together pore edges brought together by the shot peening step whereby a part is produced substantially ready for use in its finished desired form and characterized by its high resistance to fatigue.

---



2,769,710

## PROCESS FOR THE CONTINUOUS TREATMENT OF VEGETABLE FIBERS

Frederick George Lucas Rocher, deceased, late of Hatch End, Middlesex, England, by Edward Goulding and Dorothy John, executors, London, England, assignors to Cellulose Development Corporation Limited, Hatch End, Middlesex, England, a British company

Continuation of application Serial No. 119,699, October 5, 1949. This application January 12, 1954, Serial No. 403,518
2 Claims. (Cl. 92—7)

1. A method of continuously digesting vegetable fibrous material with a treating solution which consists in causing the vegetable fibers mixed with a suitable reagent under elevated temperature to continuously descend under gravity through an upright tower thereby rendering the impurities in the fibers separable, continuously agitating the mixture near the bottom of the tower at a pressure which is at least equal to the vapor pressure of the treating liquid at the elevated temperature and

which is solely provided by the height of the material in the tower and continuously introducing diluting liquid at the top of the zone of agitation and varying the rate of introduction of diluting liquid in accordance with the consistency of the mixture.

2,769,711

## DEPOSITION OF TACKY IMPREGNATING AGENTS ON CELLULOSIC FIBERS

Lucius H. Wilson, Riverside, Conn., assignor to American Cyanamid Company, New York, N. Y., a corporation of Maine

No Drawing. Application May 14, 1952, Serial No. 287,801
12 Claims. (Cl. 92—21)

1. In a method for making an impregnated cellulosic product wherein an aqueous suspension of fibrous cellulosic material is prepared, a hydrophilic cationic resin is added to said suspension, said suspension is aged until adsorption of said resin by said fibers is substantially complete, an aqueous dispersion of a water-insoluble hydrophobic organic impregnating agent in a tacky stage containing a water-soluble soap as principal dispersing agent is added to said suspension, the weight of impregnating agent in said dispersion being 25% to 100% of the weight of said fibrous material, and particles of said impregnating agent are deposited from said dispersion uniformly on said fibers by the action of said adsorbed cationic resin: the steps of adding to said dispersion of said impregnating agent sufficient of a stabilizing mixture containing about 55% to 80% by weight of a non-ionic dispersing agent and 20% to 45% by weight of an anionic dispersing agent selected from the group consisting of the alum-stable sulfonate and the alum-stable sulfate dispersing agents to render said emulsion stable in the presence of about 5% of alum, based on the weight of impregnant in said dispersion, and then depositing particles of said impregnating agent on said fibers in the presence of at least about ⅛ mol of alum based on the mols of the soap in said dispersion.

---

2,769,712

## MANUFACTURE OF LEATHER SHEETS CONTAINING NORMALLY TACKY IMPREGNATING AGENTS

Lucius H. Wilson, Riverside, Conn., assignor to American Cyanamid Company, New York, N. Y., a corporation of Maine

No Drawing. Application October 28, 1952, Serial No. 317,358
6 Claims. (Cl. 92—21)

1. In a method for making an impregnated leather sheet by the steps of preparing an aqueous stock of

leather fibers, adding an aqueous colloidal dispersion of a normally tacky, water-insoluble hydrophobic organic impregnating agent containing a soap as principal dispersing agent therefor, depositing said impregnating agent on the fibers while in aqueous suspension, and forming the fibers into a sheet, the steps of first adding to the fiber suspension at pH between about 3 and 7 a colloidal cationic dimethylolurea water-soluble polyfunctional nitrogen base resin, then adding said aqueous dispersion of tacky impregnating agent containing, in addition, a non-ionic surface-active agent and an anionic surface-active agent selected from the group consisting of the alum-stable sulfonate and the alum-stable sulfate dispersing agents, and sheeting and drying the fibers; the weight of said impregnant being between about 15% and 100% of the weight of the fibers; the weight of said cationic resin being about 5% and 15% of the weight of said impregnant, the weight of non-ionic agent being between 1% and 10% of the weight of the fibers, and the weight of anionic surface-active agent being between 25% and 100% of the weight of non-ionic surface-active agent.

---

2,769,713

**METHOD OF MAKING ASBESTOS PAPER CONTAINING A TACKY BONDING AGENT**

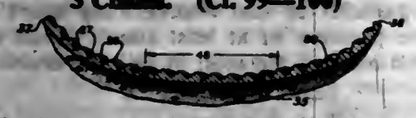
Lucius H. Wilson, Riverside, Conn., assignor to American Cyanamid Company, New York, N. Y., a corporation of Maine

No Drawing. Application March 27, 1953, Serial No. 345,242

8 Claims. (Cl. 92—21)

1. A method for manufacturing asbestos paper of improved strength, pliability and elasticity from alkaline-reacting asbestos fibers in aqueous suspension and an anionic normally alum-unstable latex of a normally tacky bonding agent for said fibers without causing said fibers to clot, which comprises forming a stock of papermaking asbestos fibers, adding to an aqueous anionic alum-unstable latex of a tacky organic hydrophobic bonding agent sufficient of a nonionic dispersing agent and sufficient of an anionic dispersing agent selected from the group consisting of the alum-stable sulfate and alum-stable sulfonate dispersing agents to render said latex alum-stable, the weight of said added alum-stable anionic dispersing agent being between 25% and 100% of the weight of said added nonionic dispersing agent, adding said thus stabilized latex to said suspension of asbestos fibers, the weight of bonding agent in said latex being between about 5% and 50% of the dry weight of the fibers, thereby flocculating and irreversibly precipitating at least a major proportion of said bonding agent on said fibers; forming said fibers into paper, and drying said paper.

---



2,769,714

**SLICED POTATO PRODUCT**

Bernhardt Stahmer, Omaha, Nebr.

Application April 12, 1955, Serial No. 500,840

3 Claims. (Cl. 99—100)

1. A sliced potato product comprising, first and second oppositely disposed faces, said first face having a plurality of alternately spaced ridges and grooves, said ridges and grooves having a radius of curvature in the range of from three inches to nine inches, said second face of said sliced potato product having a substantially smooth surface, said sliced potato product having a maximum thickness from the top of said ridges to said second face, the thickness from the bottom of said grooves to said second face of said sliced potato product being approximately in the range of from one-fourth to one-half of said maximum thickness, said ridges having an amplitude of a value which is greater than said thickness from the bottom of said grooves to said second face, said ridges having a pitch in a range of from at least three per inch to twenty-five per inch, the length of the pitch between each of the peaks of each of said ridges being greater than one-half of said thickness from the bottom of said grooves to said second face, said sliced potato product having a series of spaced perforations extending from one face to the other face thereof.

---

2,769,715

**SLICED CORRUGATED POTATO PRODUCTS**

Bernhardt Stahmer, Omaha, Nebr.

Application October 21, 1955, Serial No. 542,021

3 Claims. (Cl. 99—100)

1. A sliced potato product having a centrally disposed web with first and second opposed faces, a first set of ridges extending across said first face of said web in substantially parallel arcuate paths, a second set of ridges extending across said second face of said web in substantially parallel arcuate paths, said first set of ridges having divergingly disposed side walls having an angle therebetween lying in a range from 30 to 90 degrees, said side walls terminating in a widened base at said first face of the web with said side walls of the first set of ridges defining a first set of grooves having bottom surfaces meeting with the first face of said centrally disposed web, said second set of ridges having divergingly disposed side walls having an angle therebetween lying in a range from 30 to 90 degrees, said side walls terminating in a widened base at said second face of the web with said side walls of the second set of ridges defining a second set of grooves having bottom surfaces meeting with the second face of said centrally disposed web, the thickness of the web lying in a range between .002 to .060 inch, the number of ridges lying in a range from 5 to 12 per inch, the height of the ridges from the top thereof to the bottom of the valleys lying in a range from .020 to .080 inch.

---

2,769,716

**FUNGISTATIC PIGMENT AND COATING COMPOSITION**

James J. Rankin, Beaver, Pa., assignor to St. Joseph Lead Company, New York, N. Y., a corporation of New York

No Drawing. Application January 16, 1953, Serial No. 331,748

12 Claims. (Cl. 106—15)

5. A composition for coating and the like comprising a vehicle and at least ten percent by weight of a fungistatic zinc oxide pigment having incorporated therein a zinc oxyhalide compound in amount equivalent to from about 0.1 to about 1.0 percent halogen content.

---

2,769,717

**DENTAL IMPRESSION MATERIAL**

James Creavey, Milford, Del., assignor to The L. D. Caulk Company, Milford, Del., a corporation of Delaware

No Drawing. Application November 25, 1953, Serial No. 394,477

14 Claims. (Cl. 106—38.35)

1. A composition for taking dental impressions consisting essentially of an alkali metal alginate, calcium sulphate and an alkali metal zinc fluoride, said fluoride being adapted to eliminate fixing of said composition while maintaining the shelf life and proper setting time thereof.

---

2,769,718

**ZIRCONIA CEMENT**

Neil N. Ault, Holden, Mass., assignor to Norton Company, Worcester, Mass., a corporation of Massachusetts

No Drawing. Application October 12, 1954, Serial No. 461,935

2 Claims. (Cl. 106—35)

1. A chemical setting cement mixture as yet unset essentially consisting of from 90% to 99% of zirconia of which at least 80% is stabilized zirconia containing from 3% to 6% by weight of lime, CaO, on the amount of $ZrO_2$ thereof, the remainder aluminum phosphate having a pH at least as high as 3 numerically.

---

2,769,719

**CEMENT MANUFACTURE**

Fred D. De Vaney, Hibbing, Minn., assignor to Erie Mining Company, Hibbing, Minn., a corporation of Minnesota

Application January 13, 1953, Serial No. 331,027

1 Claim. (Cl. 106—89)

Portland cement clinker in the form of discrete small spheroids composed of alkaline earth metal silicates and aluminates the outer surface layers of the spheroids being composed of essentially unfused particles of alkaline earth metal silicates and aluminates and the interiors of the spheroids comprising glassy phase fused alkaline earth metal silicates and aluminates of essentially the same chemical composition as are the particles constituting the outer surface layers.

---

2,769,720

**FORMULA FOR CEMENTITIOUS COMPOSITION**

Albert L. Talone, Philadelphia, Pa.

No Drawing. Application December 15, 1954, Serial No. 475,576

1 Claim. (Cl. 106—97)

A cementitious aggregate for a slow-setting, non-shrinking, thixotropic, water retaining, whitish cohesive cementitious composition capable of use on highly porous surfaces which consists of a mixture in parts by weight of 100 parts Portland cement, 5–25 parts kaolin, 10–50 parts pumice, and .62–6.2 parts of a salt selected from the group consisting of sodium chloride and potassium bitartrate.

---

2,769,721

**PIGMENT COMPOSITIONS**

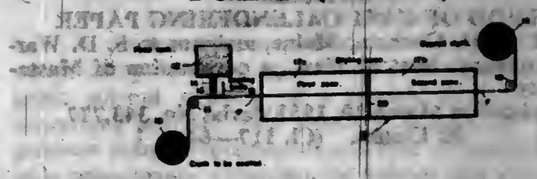
Egon Frankl, Rochester, N. Y., assignor to Rochester Button Company, Rochester, N. Y., a corporation of New York

No Drawing. Application September 29, 1952, Serial No. 312,178

15 Claims. (Cl. 106—308)

1. A method of making readily dispersible dry lamellar pearlescent pigment compositions which comprises adding a Werner type complex compound of trivalent chromium with an aliphatic carboxylic acid of the group consisting of alpha, beta unsaturated aliphatic carboxylic acids containing from 2 to 6 carbon atoms in the aliphatic chain and long chain fatty acids containing from 10 to 20 carbon atoms to an aqueous dispersion of a lamellar pearlescent pigment selected from the group consisting of acid lead phosphate and acid lead arsenate and thereafter separating the pigment from the dispersion and drying the pigment.

---



2,769,722

**PROCESS FOR PREPARING A HEAT INSULATED FABRIC**

Sherman Converse, Aiken, S. C., assignor to Graniteville Company, Graniteville, S. C., a corporation of South Carolina

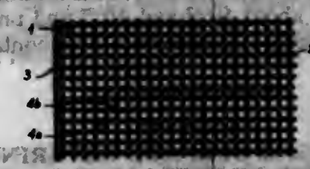
Application April 8, 1954, Serial No. 421,889

2 Claims. (Cl. 117—6)

2. A process for preparing a heat-insulated fabric suitable for use in wearing apparel which comprises coating an initially uncoated base fabric with a first organosol containing from about 5% to about 20% aluminum powder, heating the coated fabric at a temperature of about 250° F. for about 1¼ minutes to drive off the volatile liquid from the organosol and leave a heat-insulating coating on the fabric, coating said insulating coating with a second organosol containing from about 10 to about 20% non-metallic coloring pigments, and then heating the thus coated fabric in two stages, one at about 290° F. for about 35 seconds and the other at about 400° F. for about 35 seconds first to drive off the volatile liquid from the second organosol and then to interfuse the resin and plasticizer in both organosols, and finally embossing the top coating to the desired design.

---

2,769,723



**NEEDLEWORK CANVAS CARRYING A STITCHWORK PATTERN AND METHOD OF STENCILLING SAID PATTERN THEREON**

Louis Bailly, Vevey, Switzerland

Application March 20, 1953, Serial No. 343,662

Claims priority, application Germany April 21, 1952

4 Claims. (Cl. 117—38)

1. A coarse needlework canvas carrying a pattern for carpets, tapestries, embroideries and the like stitchwork, said canvas having a system of spaced weft threads, a system of spaced warp threads and a pattern of marks applied only to apparent sections of only one of said system of threads in colors and locations corresponding to the colors and locations of the stitches to be executed, said apparent sections being situated exclusively between the threads of the other system.

---

2,769,724

**WAX IMPREGNATED LEATHER AND METHOD OF MAKING SAME**

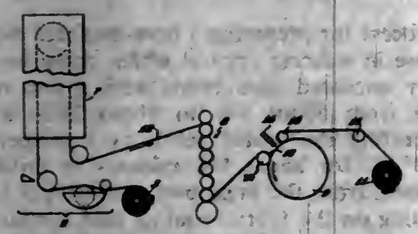
Alfred Studenic, Gloversville, and Anthony Studenic, Johnstown, N. Y.

No Drawing. Application November 21, 1952, Serial No. 321,954

3 Claims. (Cl. 117—55)

1. In making leather from skins that have been tanned and fat-liquored, the process which comprises applying to the skins, at a pH of about 4–6, an aqueous emulsion consisting essentially of a dispersion of a surface active, non-cationic penetrating agent in a volatile solvent that is immiscible with water, subjecting the thus treated skins to an elevated temperature to remove water and solvent by evaporation thereof, and then applying thereover an emulsified mixture of a water insoluble wax, an emulsify-

ing agent, and a zirconium salt in water, removing the excess of unabsorbed emulsified mixture from the skins, and drying the resulting product, this method giving a vapor permeable, water repellent, and soil and stain resistant product.



---

2,769,725

## METHOD OF CAST CALENDERING PAPER

Robert T. Hart, Gorham, Maine, assignor to S. D. Warren Company, Boston, Mass., a corporation of Massachusetts

Application March 20, 1953, Serial No. 343,777
32 Claims. (Cl. 117—64)

1. In a process for producing a coated paper having a level surface, comprising applying aqueous liquid to a dry coating surface of a coated paper, the coating of such paper comprising a hydrophilic swellable protein, to wet said dry coating surface and immediately thereafter pressing said wetted coating surface against a highly polished, smooth, finishing surface with which said wetted coating surface is kept in contact while moisture is evaporated therefrom and thereafter removed, the improvement comprising contacting said wetted coating surface, before it is pressed against said finishing surface, with formaldehyde, and maintaining the surface of the coating in contact with the finishing surface while the pH of the surface of the coating is maintained between 7.3 and 9 by the presence of a member of the group consisting of amines and quaternary ammonium hydroxides having a boiling point above about 125° C. and a basic ionization constant between about $10^{-9}$ and $10^{-7}$ and until the time when the coated surface is removed from contact with the finishing surface.

## FLEXIBLE HARD SURFACE COVERING AND PROCESS OF PREPARING SAME

Paul C. Wetterau, Mountain Lakes, John Bishop, Chatham, and Spencer Johnson, Pompton Plains, N. J., assignors to Congoleum-Nairn Inc., a corporation of New York

Application September 28, 1953, Serial No. 382,572
9 Claims. (Cl. 117—76)

1. A flexible hard surface covering which comprises a bitumen-impregnated felt base sheet, a vinyl composition top layer and in combination for bonding said top layer to said base sheet and for providing a seal therebetween a seal coat of paint consisting essentially of oleoresinous binder material and filler applied to and formed on said base sheet, the said binder material being comprised in said seal paint so as to constitute from about 50% to about 135% of the oil absorption value of said filler; a first primer coat applied to and formed on said seal coat and characterized by binder material consisting essentially of butadiene-acrylonitrile copolymer rubber and vinyl polymer resin selected from the group consisting of polymerized vinyl chloride, polymerized vinylidene chloride and copolymers thereof in the relative proportion by dry weight of about 20 to about 70 parts by weight of said butadiene-acrylonitrile copolymer rubber and about 80 to about 30 parts of said vinyl polymer resin, any filler contained in said first primer coat being less than about 80% by weight of said coat; and a second primer coat applied to and formed on said first primer coat and characterized by binder consisting essentially of butadiene-acrylonitrile copolymer rubber, vinyl polymer resin selected from the group consisting of polymerized vinyl chloride, polymerized vinylidene chloride and copolymers thereof and plasticizer for said vinyl polymer resin, said butadiene-acrylonitrile rubber and vinyl polymer being present in the relative proportions in parts by weight of about 20 to about 70 parts of the former and about 80 to about 30 parts of the latter, there being about 5 to about 300 parts by weight of plasticizer per 100 parts by weight of vinyl resin and any filler contained in said second primer coating being less than about 80% by weight of said second primer coat; said vinyl composition top layer being applied to and formed on said second primer coat.

2,769,727

## SIZING AND DRYING OF FILAMENTARY MATERIAL

Seth T. Bowen, Union, and Fred Fortess, Somerville, N. J., assignors to Celanese Corporation of America, New York, N. Y., a corporation of Delaware

Application May 1, 1953, Serial No. 352,590
1 Claim. (Cl. 117—103)

Process for the production of sized filamentary material, which comprises applying to filamentary material comprising pigmented cellulose acetate yarns an aqueous ammoniacal solution of a water-insoluble copolymer of vinyl acetate and an ethylenically unsaturated carboxylic acid, said copolymer having a carboxyl content of 2 to 5% by weight, and drying the filamentary material carrying said solution by passing said filamentary material at the rate of about 25 to 35 yards per minute over a plurality of drying cans having smooth stainless steel surfaces, the first two heated cans engaged by said filamentary material being at temperatures of 205° F. to 230° F. and the succeeding cans being at temperatures of 180° F. to 200° F.

---

2,769,728

## APPARATUS FOR AND METHOD OF CONVEYING ARTICLES

James W. Juvinall, Indianapolis, Ind., assignor to Ransburg Electro-Coating Corp., Indianapolis, Ind., a corporation of Indiana

Application May 22, 1952, Serial No. 289,333
11 Claims. (Cl. 117—104)

1. A method of coating the sides of a plurality of generally cubically shaped articles as the articles move along a predetermined path comprising supporting the articles in seriatim along a track with adjacent outwardly facing sides of adjacent articles positioned in common planes, said outwardly facing sides of said adjacent articles forming two substantially continuous surfaces to be coated, moving said articles through a first coating zone, spray coating the outwardly facing opposite sides of said articles, uniformly increasing the spacing between adjacent articles, indexing each article approximately 90°, uniformly decreasing the spacing between articles until adjacent outwardly facing sides of the articles form two substantially continuous surfaces to be coated, moving said articles through a second coating zone, and spray coating the outwardly facing opposite sides of said articles.

2,769,729

## PROCESS FOR FIREPROOFING POROUS MATERIALS

Lodewijk J. C. Van de Zande, Schoten-Antwerp, Belgium

No Drawing. Application December 3, 1954, Serial No. 473,826
Claims priority, application Belgium December 5, 1953
2 Claims. (Cl. 117—137)

1. A process for fireproofing fabrics, paper, and porous material in general, which comprises impregnating the material to be fireproofed with a solution of ammonium sulfate, ammonium phosphate, boric acid, sodium tetraborate, 1 to 5% by weight of glycerine, and 1 to 5% by weight of Turkey red oil.

---

2,769,730

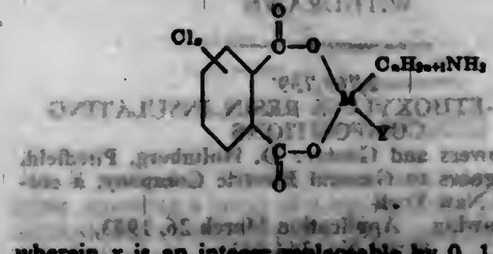
## METHOD OF TREATING CELLULOSIC MATERIALS

Songe S. Sakornbut, Kirkwood, Mo., assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application June 21, 1954, Serial No. 438,343
19 Claims. (Cl. 117—137)

1. The method of treating porous cellulosic materials which comprises applying to the porous materials an aqueous ammoniacal solution of a zinc compound, drying the said material and then treating the material with a composition comprising a hydrocarbon oil boiling between 110° C. and 220° C., from 3 to 8 percent by weight of a chlorinated phenol, from 8 to 20 percent of a chlorinated hydrocarbon containing at least 40 percent chlorine, from 3 to 10 percent of an ester of phosphoric acid and from 0.1 to 2 percent of petroleum wax, all percentages of the components of said composition being based on the weight of the resulting solution.

---



2,769,731

## FUNGICIDAL METAL SALTS OF PHTHALIC ACID

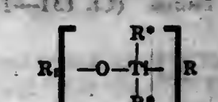
Alfred F. Schneid, New Milford, N. J., and Paul Resnick, Brooklyn, and Roy A. Pinnarello, Mount Vernon, N. Y., assignors to Interchemical Corporation, New York, N. Y., a corporation of Ohio

No Drawing. Application July 30, 1953, Serial No. 371,402
13 Claims. (Cl. 117—138.5)

1. A fungicidal composition having the following generic formula:

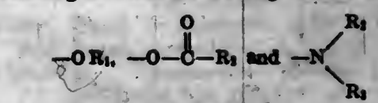
wherein $x$ is an integer replaceable by 0, 1, 2 and 4, M is a metal of the group consisting of copper and zinc, n in an integer not smaller than 8, and Y is a member of the group consisting of $H_2O$ and $C_nH_{2n+1}NH_2$.

---



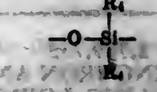
2,769,732

## PROCESS FOR PREPARING WATER-REPELLENT FABRIC AND RESULTING PRODUCT



Thomas Boyd, Springfield, Mass., assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application May 13, 1953, Serial No. 354,091
22 Claims. (Cl. 117—161)



1. A process for preparing a water-repellent fabric which comprises treating a fabric with an anhydrous organic solvent solution of a straight-chain, titanium-containing polymer, said solution of titanium-containing polymer being homogeneous and free of suspended insoluble constituents, removing the solvent and exposing the treated fabric to an atmosphere containing moisture, said titanium-containing polymer consisting essentially of a compound taken from the group consisting of homopolymers of tetraorgano derivatives of orthotitanic acid, interpolymers of a plurality of said tetraorgano derivatives and copolymers of said tetraorgano derivatives with organo silanes, said homopolymers and said interpolymers of said tetraorgano derivatives having the formula:

wherein $n$ is an integer greater than 1, $R_1$ is taken from the group consisting of alkyl, aryl, aralkyl, alkenyl, and aralkenyl radicals, and R and R* are taken from the group consisting of radicals having the formula:

$R_1$ having the significance given above, $R_2$ being taken from the group consisting of alkyl and aryl radicals and $R_3$ being taken from the group consisting of hydrogen and $R_2$, said copolymers of said tetraorgano derivatives with said organo silanes having the general formula given above and containing, additionally, in the polymer chain, at least one radical having the formula:

wherein $R_4$ is a radical taken from the group consisting of $R_5$ and —$OR_5$, $R_5$ being a hydrocarbon radical, said straight-chain, titanium-containing polymers having been prepared by dissolving 1 molar proportion of the corresponding monomer in at least 3 molar proportions of anhydrous organic solvent, dissolving 0.7 to 1 molar proportion of water in an organic solvent compatible with the monomer solution and slowly adding the water solution to the monomer solution with constant agitation.

---

2,769,733

## METHOD OF DEPOSITING PARTICLES ON A CATHODE RAY TUBE SCREEN STRUCTURE

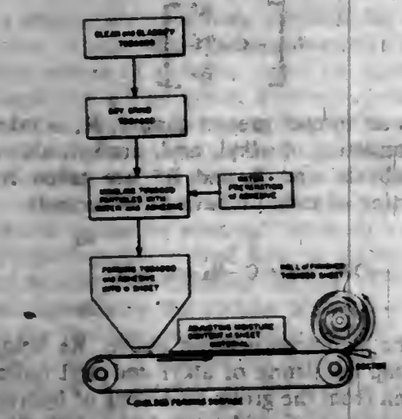
Charles H. Pool, North Wales, Pa., assignor to Philco Corporation, Philadelphia, Pa., a corporation of Pennsylvania

Application January 28, 1953, Serial No. 333,726
6 Claims. (Cl. 117—211)

1. The method of forming a layer of secondary electron emissive material in intimate contact with a sub-

strate constituted by the previously formed portions of a cathode ray tube screen structure, said method comprising the steps of depositing on the surface of said substrate particles of said material dispersed in a material which is water soluble at deposition and which is responsive to a stimulus to become insoluble, washing said surface with water to remove all but those of said particles which are in intimate contact with said surface, depositing on said surface additional particles of the same material, also dispersed in a fluid material which is water soluble at deposition and which is responsive to a stimulus to become insoluble, and subjecting said deposited material to said stimulus.

---



2,769,734

## TOBACCO SHEET MATERIAL AND METHOD OF FORMING

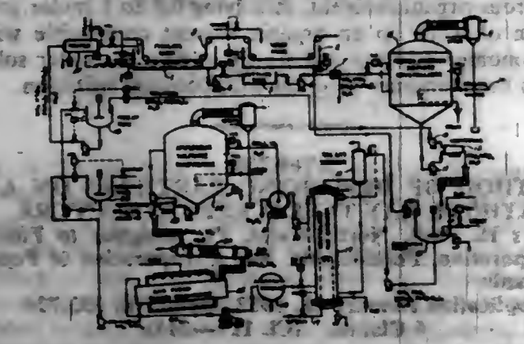
David Bandel, Stamford, Conn., assignor to International Cigar Machinery Company, a corporation of New Jersey

Application July 14, 1955, Serial No. 522,162

24 Claims. (Cl. 131—15)

1. Tobacco sheet material comprising finely divided tobacco, at least a portion of which is entirely dry ground, within a matrix of an initially water insoluble polysaccharide adhesive.

---



2,769,735

## METHOD OF PICKLING IRON AND RECOVERING PICKLING AGENT

Clark O. Miller, Cleveland, Ohio, assignor to Cleveland Industrial Research, Inc., Cleveland, Ohio, a corporation of Ohio

Application September 29, 1954, Serial No. 459,101

7 Claims. (Cl. 134—13)

1. In a process for pickling ferrous metal including the steps of immersing said metal in an aqueous pickling bath of ammonium acid sulphate to yield ferrous ammonium sulphate in aqueous solution, then by a process including the steps of oxidation and raising the pH to at least 7 with an ammonia-containing fluid, thereby converting said ferrous ammonium sulphate to oxide of iron and di-ammonium sulphate, recovering di-ammonium sulphate from the resulting solution, heating said di-ammonium sulphate to convert it to ammonium acid sulphate and returning said ammonium acid sulphate to the pickling operation, the improvement which comprises separating ferrous ammonium sulphate from the spent aqueous pickling solution containing said ferrous ammonium sulphate and any unreacted ammonium acid sulphate, and subjecting a water solution of the ferrous ammonium sulphate thus recovered to said process including the steps of oxidation and raising the pH to at least 7 and the steps following said latter process as aforesaid.

---

2,769,736

## PROCESS OF IMPROVING THE PROPERTIES OF HEAT RESISTANT ALLOYS

William H. Zisell, Passaic, and Henry J. Forrest, Morris Plains, N. J., assignors to Fothell Corporation, Teaneck, N. J., a corporation of New Jersey

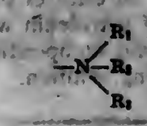
No Drawing. Application April 13, 1955, Serial No. 501,192

2 Claims. (Cl. 148—3)

1. A process for improving the physical properties of a high-temperature cobalt-base alloy which comprises remelting the alloy at a temperature from 3100 to 3600° F. stirring into the molten alloy from 15 to 25% of powdered calcium carbonate, pouring the alloy into a mold preheated to at least 1500° F. and slowly cooling the cast alloy.

---

2,769,737



## AMINE PHOSPHATE COATING SOLUTIONS AND METHOD OF COATING

William S. Russell, Royal Oak, Mich., assignor to Parker Rust Proof Company, Detroit, Mich., a corporation of Michigan

No Drawing. Application March 26, 1952, Serial No. 278,743

11 Claims. (Cl. 148—6.15)

1. A method for cleaning and producing a metallic phosphate coating on a metal of the class consisting of mild steel, zinc and aluminum which comprises the step of contacting the surface of the metal with an acidic aqueous solution consisting essentially of phosphoric acid, water and a substituted amine phosphate having the structure:

wherein $R_1$ and $R_2$ are each a member of the class consisting of hydrogen and hydrocarbon radicals having less than 7 carbon atoms and of the group consisting of alkyl, aryl and cycloalkyl, and $R_3$ is a member of the class consisting of hydrocarbon radicals having less than 7 carbon atoms and of the group consisting of alkyl, aryl and cycloalkyl, said phosphate yielding at least about .01% of a phosphate ion in the solution, the pH of the solution being between 3 and 6.

2,769,738

WITHDRAWN

---

2,769,739

## SHELLAC-ETHOXYLINE RESIN INSULATING COMPOSITIONS

Ralph G. Flowers and Gustave D. Holmberg, Pittsfield, Mass., assignors to General Electric Company, a corporation of New York

No Drawing. Application March 26, 1953, Serial No. 344,892

13 Claims. (Cl. 154—43)

1. A composition of matter consisting essentially of the product obtained by reacting (1) an ethoxyline resin comprising the reaction product of a polyhydric phenol and an epihalogenohydrin and (2) at least 10% by weight of shellac based on the weight of the combined resins.

---

2,769,740

## NYLON TRIMMING WITH A SECURING MEMBER THEREON IMPREGNATED WITH A POLYVINYL RESIN COUPLED TO AN ACID RADICAL

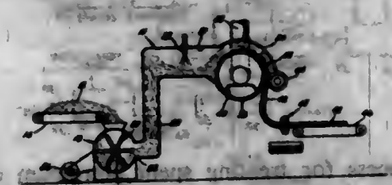
Richard A. Gessler, Brooklyn, N. Y.

Application November 9, 1953, Serial No. 391,106

2 Claims. (Cl. 154—46)

1. A nylon trimming formed with a plurality of pleats, a securing member disposed across the edge portions of said pleats securing said pleats to one another, said securing member being impregnated with a water dispersion of polyvinyl chloride.

---



2,769,741

## METHOD OF MAKING A FIBROUS ARTICLE

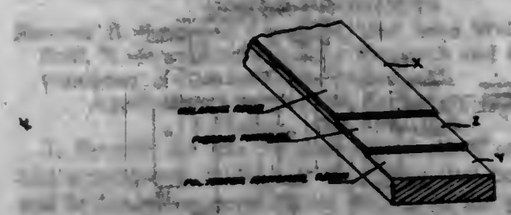
Ralph E. Schwartz, Saukland, Calif., assignor to The Mallorca Corporation, Los Angeles, Calif., a corporation of California

Application January 19, 1953, Serial No. 331,778

4 Claims. (Cl. 154—101)

3. The method of making an article of manufacture which includes the steps of applying a controlled amount of resin solution to a plurality of fibers to form a wet, fibrous resin mat, squeezing a controlled amount of said resin solution out of said wet resin mat, curing said resin then remaining in said wet resin mat, cutting said article out of said cured resin mat, applying a controlled amount of elastomer solution to said cut article, squeezing a controlled amount of said elastomer solution out of said wet article, and setting the elastomer then remaining in said wet article.

---



2,769,742

## SURFACING RESIN BODIES

Clarence H. Holbing, Milwaukee, Wis., assignor to Pittsburgh Plate Glass Company, Allegheny County, Pa., a corporation of Pennsylvania

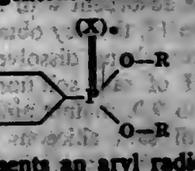
Application April 29, 1952, Serial No. 285,945

8 Claims. (Cl. 154—129)

1. A method of forming a laminated body which comprises spreading a syrup of a condensation product of an aldehyde and a compound of a class consisting of a triazine and urea upon a smooth impermeable supporting surface, drying the syrup to a solid state, applying a layer of a polymerizable mixture of a compound containing the group >C=CH₂ and a polyester of an alpha-beta dicarboxylic ethylenically unsaturated acid, and curing the sandwich upon the surface to a hard, coherent state and stripping off the laminate.

---

2,769,743



## PEST CONTROL UTILIZING PESTICIDAL COMPOSITIONS OF PHOSPHORUS

Raymond W. Mathews, Yorba Linda, Calif., assignor to Union Oil Company of California, Los Angeles, Calif., a corporation of California

No Drawing. Application April 18, 1952, Serial No. 283,135

13 Claims. (Cl. 167—30)

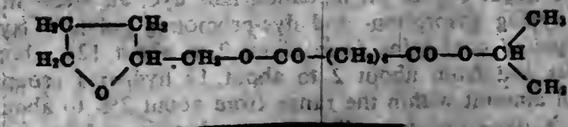
1. The method of protecting living plants from attack by pest organisms which comprises applying to the surface of said plant a toxic amount of a pest control composition containing as an essential active ingredient a compound having the general formula

wherein each R represents an aryl radical, X represents a substituent selected from the class consisting of oxygen and sulfur and *n* represents an integer not greater than 1.

---

2,769,744

## INSECT REPELLENT COMPOSITION AND METHOD



Edmund Ueteri, Basel, Switzerland, assignor to Ciba Limited, Basel, Switzerland, a Swiss firm

No Drawing. Application February 5, 1951, Serial No. 209,515

Claims priority, application Switzerland February 16, 1950

3 Claims. (Cl. 167—33)

2. A process of repelling insects, which comprises applying to the region from which the insects are to be repelled, a repellent composition of matter, which contains as an insect repellent active substance the ester of the formula

---

2,769,745

## VINYL BENZENE COMPOUND COMPOSITION AND METHOD FOR THE TREATMENT OF SOIL

John L. Hardy, Midland, Mich., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Application January 18, 1954, Serial No. 404,771

7 Claims. (Cl. 167—39)

6. A concentrate composition comprising at least 5 percent by weight of an active ingredient in intimate association with a surface active dispersing agent, the active ingredient being at least one member of the group consisting of divinyl benzene and ethyl vinyl benzene.

---

2,769,746

## MONO-HYDROXYCYCLOALKANE AND ORTHO BORIC ACID MIXTURE OINTMENT-LIKE COMPOSITION

Margaret M. Clark, Mountain Lakes, N. J., assignor of one-half to Arthur R. Clark, Mountain Lakes, N. J.

No Drawing. Application February 29, 1952, Serial No. 274,297

6 Claims. (Cl. 167—63)

1. A new composition of matter, which composition is an intimate admixture of about 25 to 55 parts of a mono-

hydroxycycloalkane having 4 to 10 carbon atoms, ortho boric acid in amount ranging from about 50 to about 112 mole per cent based on the mono-hydroxycycloalkane, about 1 to about 6 parts of a suspension stabilizing agent and water q. s. 100.

---

2,769,747

## PROCESS OF SEPARATION OF SILICEOUS IMPURITIES FROM INSULIN SOLUTIONS

Lorne G. Sampson, Chicago, Ill., assignor to Armour and Company, Chicago, Ill., a corporation of Illinois

No Drawing. Application February 18, 1953, Serial No. 337,690

4 Claims. (Cl. 167—75)

1. In a process for recovering insulin from pancreas glands wherein the extracted insulin is adsorbed on a clay adsorbent, the steps of eluting the adsorbed insulin by contacting the adsorbent with an aqueous eluant at a pH of from 9.5 to 13, thereby obtaining an aqueous solution of insulin containing dissolved siliceous impurities, adjusting the pH of said solution to a pH within the range from 6.5 to 9.0, maintaining said solution at said adjusted pH until said siliceous impurities have been formed into a flocculent precipitate, and separating said precipitate from said solution.

---

2,769,748

## THICKENED HAIR DYEING COMPOSITION COMPRISING POLYHYDROXYL COMPOUND AND ALKANOLAMINE

Wolfgang Max Josef Eckardt and Siegfried Roland Preisinger, Bad Segeberg, Holstein, Germany, assignors to Lever Brothers Company, New York, N. Y., a corporation of Maine

No Drawing. Application February 25, 1952, Serial No. 273,352

Claims priority, application Germany February 26, 1951

11 Claims. (Cl. 167—85)

1. A hair dyeing composition comprising an amount up to about 5% of an oxidation hair dye; an alcoholic, non-dyeing absorption- and dye-promoting polyhydroxyl compound containing from about 2 to about 12 carbon atoms and from about 2 to about 12 hydroxyl groups in an amount within the range from about 2% to about 6%; a dye-equalizing alkanolamine having at least one alkylol chain of low molecular weight up to about 12 carbon atoms and from 6 to 9 hydroxyl groups in an amount within the range from about 3% to about 15%; and a compound capable of supplying ammonium ions in an amount within the range from about 3% to about 5%; the said composition having a pH from 7 to 9.

---

2,769,749

## METHOD OF EXTRACTING AND PURIFYING ACYLASE

William M. Thompson and Leonard A. Graham, Chicago, and Roland J. Seidel, Des Plaines, Ill., assignors to Armour and Company, Chicago, Ill., a corporation of Illinois

No Drawing. Application February 24, 1953, Serial No. 338,612

10 Claims. (Cl. 195—66)

1. In a method of preparing acylase, the steps of contacting acylase-bearing kidney tissue with a mixture of water and from 10 to 20% by volume of a monohydroxy alkane having less than 4 carbon atoms at a pH of from 5.1 to 7.0 and a temperature of less than 10° C. to obtain an extract of acylase, and separating the acylase extract from the tissue residue.

2,769,750

## PROCESSES EMPLOYING HOMOGENOUS MIXTURE OF INERT ADSORBENT AND SUBSTRATE

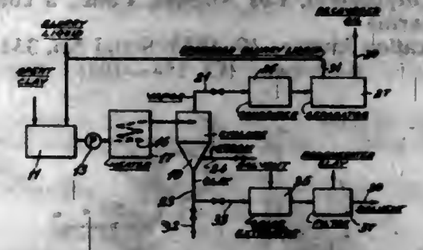
Rhett G. Harris, Falsbur, Va., assignor to Texaco Development Corporation, New York, N. Y., a corporation of Delaware

No Drawing. Application March 20, 1953, Serial No. 343,997

18 Claims. (Cl. 195—116)

1. A process for improving processes involving the action of hydrocarbon-consuming microorganisms on substrates selected from the group consisting of hydrocarbons, oxygenated hydrocarbons and mixtures thereof which comprises adding sufficient anhydrous inert adsorbent in solid particle form to said substrate to form a thoroughly homogenous mixture, mixing the resulting homogenous mixture with a nutrient medium and subjecting the resulting mixture to the action of said hydrocarbon-consuming microorganisms.

---



2,769,751

## PROCESS FOR TREATING SPENT OIL REFINERY CLAY

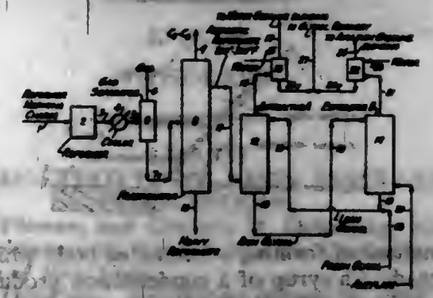
Peter L. Pauli, Norwalk, Conn., assignor to Texaco Development Corporation, New York, N. Y., a corporation of Delaware

Application April 30, 1953, Serial No. 352,240

9 Claims. (Cl. 196—14)

1. A process for treating spent petroleum clay containing color impurities and residual oil, comprising forming a flowable mixture of such spent clay in at least one vaporizable liquid selected from the group consisting of water, solvents for said residual oil, and solvents for said color impurities; passing said mixture into an initial part of a tubular heating zone; heating said mixture in said tubular zone to a temperature sufficient to vaporize both said vaporizable liquid and residual oil, thereby forming a flowing dispersion of clay particles in vapor; passing said dispersion as a flowing stream through a succeeding zone; and then separating said vapor from said clay particles.

---



2,769,752

## GASOLINE PREPARATION

Louis P. Evans, Woodbury, N. J., assignor to Socony Mobil Oil Company, Inc., a corporation of New York

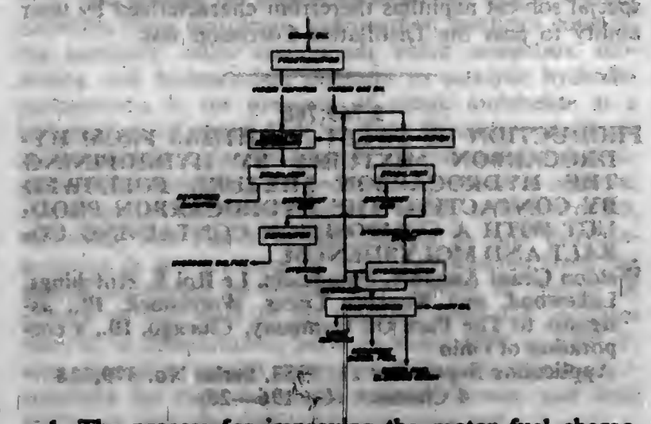
Application May 29, 1953, Serial No. 358,392

8 Claims. (Cl. 196—14.17)

1. The process for preparing a gasoline blending stock having an octane value above about 80, which comprises: contacting a hydrocarbon fraction containing at least about 22% by volume of aromatic hydrocarbons, which

boil predominantly in the range of about 170° F. to about 400° F., and containing other hydrocarbon types, with a selective non-aqueous solvent having a preferential selectivity for aromatic hydrocarbons, whereupon an extract phase comprising solvent and aromatic hydrocarbons and a raffinate phase comprising said other hydrocarbons and solvent are formed; separating said extract and raffinate phases; contacting said extract phase with a paraffinic alkylate having a boiling range from about 170° F. to about 400° F., whereby said aromatic hydrocarbons are disassociated from said extract phase and associate with said paraffinic alkylate to form said gasoline blending stock.

---



2,769,753

## COMBINATION PROCESS FOR CATALYTIC HYDRODESULFURIZATION AND REFORMING OF HIGH SULFUR HYDROCARBON MIXTURES

Le Roi E. Hutchings, Crystal Lake, and Milton M. Mariale, Elgin, Ill., assignors to The Pure Oil Company, Chicago, Ill., a corporation of Ohio

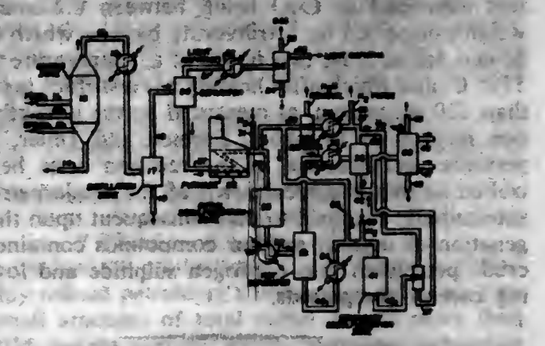
Application June 3, 1953, Serial No. 359,268

9 Claims. (Cl. 196—24)

1. The process for improving the motor fuel characteristics and decreasing the sulfur content and aromaticity of fractions obtained from high sulfur content hydrocarbon mixtures which comprises separating said hydrocarbon mixtures into a light fraction having an initial boiling point of about 200° F. and a heavy fraction having an initial boiling point of about 350° F., subjecting said light fraction to catalytic reforming and separating a reformed naphtha blending stock, subjecting said heavy fraction to hydrodesulfurization to produce a hydrodesulfurized product, subjecting said hydrodesulfurized product to hydrogenation at about 300° to 700° F. under conditions to dearomatize same and fractionating the hydrogenated product so produced to yield fractions of improved cetane number and low aromatic content.

---

2,769,754



## PROCESS FOR HYDRODESULFURIZATION OF COKER PRODUCTS

Sumner B. Sweetser, Cranford, and John Weikart, Westfield, N. J., assignors to Esso Research and Engineering Company, a corporation of Delaware

Application May 3, 1954, Serial No. 427,281

3 Claims. (Cl. 196—24)

1. Process for the hydrodesulfurization of hydrocarbon constituents boiling in the motor fuel boiling range and hydrocarbon constituents boiling in the gas oil boiling range, both of which are derived by the coking of heavy residual petroleum fractions, which comprises passing a combined stream of these constituents and added hydrogen through an initial hydrodesulfurization zone in a mixed liquid-gas phase operation, maintaining said initial zone at a temperature in the range of from about 650° to 700° F., withdrawing the product from said initial zone and passing the same to a hot separation zone wherein hydrocarbon constituents boiling below about 400° to 750° F. are segregated as a vapor phase, passing said vapor phase to a separator and removing hydrogen therefrom, removing from said hot separation zone a liquid phase comprising hydrocarbon constituents boiling above about 400° to 750° F., and passing said liquid phase by itself, together with added hydrogen,

through a secondary hydrodesulfurization zone, maintaining said secondary zone at a temperature in the range of from about 700° to 750° F., removing the product from said secondary hydrodesulfurization zone, separating hydrogen therefrom, combining the respective hydrodesulfurized streams and segregating a fraction boiling in the motor fuel boiling range and a fraction boiling in the gas oil boiling range.

---

2,769,755

## HYDRODESULFURIZING PETROLEUM WITH DESULPHURISATION CATALYSTS ON CALCINED TRIHYDRATE BAUXITE

Frederick William Bertram Porter and John Norman Haresnape, Sunbury-on-Thames, England, assignors to The British Petroleum Company Limited

No Drawing. Application February 20, 1952, Serial No. 272,702

Claims priority, application Great Britain February 23, 1951

2 Claims. (Cl. 196—28)

1. A process for the hydrocatalytic desulphurization of petroleum hydrocarbons under autofining conditions which comprises passing the hydrocarbon to a reacting zone where it is contacted in the presence of hydrogen and at a temperature within the range of 650–800° F. and at a pressure within the range of 25–500 p. s. i./gs. with a catalytic agent selected from the class consisting of mixtures of oxides of cobalt and molybdenum and chemical compounds of cobalt molybdenum and oxygen, the molybdenum content of the catalyst expressed as $MoO_3$ being between 1 and 15% by weight, and the cobalt content expressed as CoO being between 0.2 and 3% by weight, dispersed on a trihydrate bauxite which has been heated for at least two hours at a temperature of about 550° C., and which after heating has a surface area greater than 120 sq. m./gm. as measured by the nitrogen adsorption method of Brunauer, Emmett and Teller.

---

2,769,756

## HYDRODESULFURIZING CRUDE PETROLEUM WITH A DESULFURIZING CATALYST ON TRIHYDRATE BAUXITE

Frederick William Bertram Porter and John Shute Iditt, Sunbury-on-Thames, England, assignors to The British Petroleum Company Limited

No Drawing. Application April 2, 1952, Serial No. 280,186

Claims priority, application Great Britain April 6, 1951

2 Claims. (Cl. 196—28)

1. A process for the hydrocatalytic desulphurization of crude petroleum which comprises passing the crude petroleum to a reacting zone wherein it is contacted in

the presence of hydrogen and at a temperature within the range of 750 to 850° F. and at a pressure within the range of 500 to 1500 p. s. i. ga. with a catalytic agent selected from the class consisting of mixtures of the oxide and cobalt and molybdenum in chemical compounds of cobalt and molybdenum and oxygen, the molybdenum content of the catalyst expressed as $MoO_3$ being between 1 and 15% by weight, and the cobalt content expressed as CoO being between 0.2 and 3% by weight, dispersed on a trihydrate bauxite which has been heated for at least two hours at a temperature of about 550° C. and which after heating has a surface area greater than 120 sq. m./gm. as measured by the nitrogen adsorption method of Brunauer, Emmett and Teller, the temperature and pressure in the reaction zone being controlled so that the breakdown of the crude petroleum is substantially confined to that consequent upon the hydrogenation of organic sulphur compounds contained in the crude petroleum into hydrogen sulphide and lower boiling carbon compounds.

---

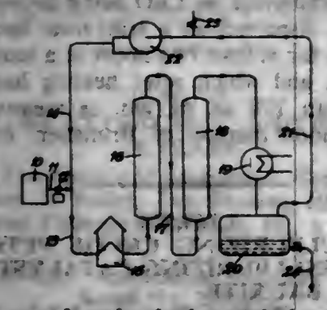
2,769,757

**PREPARATION OF NON-CORROSIVE NAPHTHAS BY REACTING REFINED NAPHTHA WITH BARIUM MOLYBDATE OR ZINC MOLYBDATE**

Weldon G. Annable, Mundelein, and Robert M. Haines, Crystal Lake, Ill., assignors to The Pure Oil Company, Chicago, Ill., a corporation of Ohio

No Drawing. Application July 26, 1954, Serial No. 445,929
4 Claims. (Cl. 196—28)

1. The method of producing special solvent naphthas of petroleum origin from highly refined hydrocarbon mixtures containing small amounts of total sulfur of not more than about 0.16 weight percent which comprises subjecting said hydrocarbon mixtures to contact with at least one reagent selected from the group consisting of zinc molybdate and barium molybdate at a temperature of about 400 to 500° F. and separating special solvent naphthas therefrom characterized by their ability to pass the distillation-corrosion test.



---

2,769,758

**REMOVAL OF SODIUM AND VANADIUM FROM PETROLEUM HYDROCARBONS FOLLOWED BY CATALYTIC DESULPHURISATION OF SAID PETROLEUM HYDROCARBONS**

Frederick William Bertram Porter and John Skeete Isitt, Sunbury-on-Thames, England, assignors to The British Petroleum Company Limited

Application March 13, 1952, Serial No. 276,256
Claims priority, application Great Britain March 20, 1951
2 Claims. (Cl. 196—28)

1. A process for the hydrocatalytic desulphurisation of a petroleum feedstock containing vanadium and sodium and selected from the class consisting of crude oils and crude oil residues, which comprises passing the feedstock in admixture with hydrogen to a zone where it is contacted with a catalyst consisting essentially of bauxite at a temperature between 700 and 850° F. and a pressure between 80 and 1000 p. s. i. ga., whereby a considerable proportion of the vanadium and sodium contained in the feedstock is retained by the bauxite, passing the products from the bauxite-contacting zone to a hydrofining zone wherein said products are contacted at elevated temperature and pressure with a sulphur-resistant hydrogenation catalyst, separating hydrogen sulphide from the products from the hydrofining zone, and recovering a product having a substantially reduced sulphur content.

---

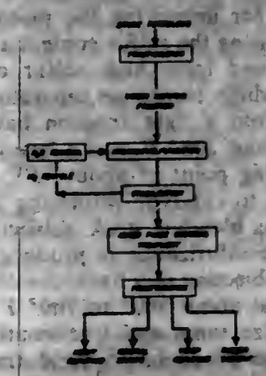
2,769,759

**PRODUCTION OF NON-CORROSIVE NAPHTHAS BY REACTING REFINED NAPHTHA WITH MOLYBDATE**

Weldon G. Annable, Mundelein, and Robert M. Haines, Crystal Lake, Ill., assignors to The Pure Oil Company, Chicago, Ill., a corporation of Ohio

No Drawing. Application July 26, 1954, Serial No. 445,928
6 Claims. (Cl. 196—28)

1. The method of producing special solvent naphthas from highly refined petroleum hydrocarbon mixtures containing small amounts of total sulfur of not more than about 0.16% by weight which comprises subjecting said hydrocarbon mixtures to contact with nickel molybdate at a temperature of about 400 to 500° F. and separating special solvent naphthas therefrom characterized by their ability to pass the Distillation-Corrosion test.



---

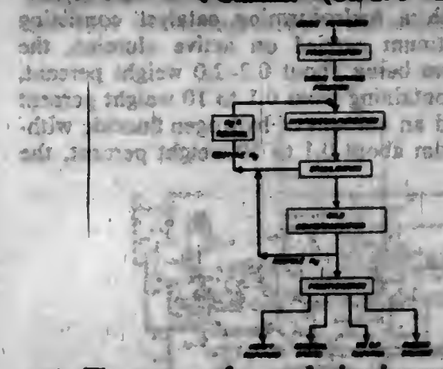
2,769,760

**PRODUCTION OF SWEET NAPHTHAS FROM HYDROCARBON MIXTURES BY HYDROFINING THE HYDROCARBON MIXTURE FOLLOWED BY CONTACTING THE HYDROCARBON PRODUCT WITH A COMPOSITION CONTAINING COBALT AND MOLYBDENUM**

Weldon Grant Annable, Mundelein, Le Roi E. Hutchings, Lakewood, and Kenneth Lucas, Woodstock, Ill., assignors to The Pure Oil Company, Chicago, Ill., a corporation of Ohio

Application September 11, 1953, Serial No. 379,528
4 Claims. (Cl. 196—28)

1. The process for producing special solvent naphthas from petroleum hydrocarbon mixtures containing at least about 1.0 weight percent total sulfur which comprises separating a virgin naphtha fraction having an end boiling point of about 425° F. from said mixtures subjecting said fraction to catalytic hydrodesulfurization in the presence of a catalyst selected from the group consisting of cobalt molybdate, cobalt oxide-molybdena-alumina and chromia-molybdena-alumina at temperatures of about 500 to 800° F. under conditions whereby said sulfur compounds are converted to hydrogen sulfide, separating hydrogen sulfide therefrom to produce a hydrodesulfurized product, subjecting said hydrodesulfurized product to chemical treatment by contact in the absence of hydrogen at temperatures of about 400 to 500° F. in the presence of a contact material selected from the group consisting of cobalt molybdate, cobalt oxide-molybdena-alumina and chromia-molybdena-alumina, and separating an odor-free product characterized by its ability to pass the Distillation-Corrosion test.



2,769,761

**COMBINATION PROCESS FOR CATALYTIC HYDRODESULFURIZATION AND MILD DEHYDROGENATION OF HIGH SULFUR HYDROCARBON MIXTURES**

Weldon Grant Annable, Mundelein, Le Roi E. Hutchings, Crystal Lake, and Kenneth Lucas, Woodstock, Ill., assignors to The Pure Oil Company, Chicago, Ill., a corporation of Ohio

Application September 10, 1953, Serial No. 379,392
4 Claims. (Cl. 196—28)

1. The process for producing improved special solvent naphthas from petroleum hydrocarbon mixtures containing corrosive sulfur compounds which comprises, subjecting said hydrocarbon mixtures to catalytic hydrodesulfurization in the presence of cobalt molybdate at a temperature of about 500° to 800° F. under conditions such that said sulfur compounds are converted to hydrogen sulfide, stabilizing the products therefrom to separate said hydrogen sulfide to produce a highly refined product, subjecting said highly refined product to mild dehydrogenation in the presence of a catalyst selected from the groups consisting of oxides and sulfides of metals of groups VI and VIII of the periodic table and mixtures thereof, at temperatures between about 820° to 880° F. and separating special solvent naphthas therefrom characterized by their increased solvency power and their ability to pass the distillation-corrosion test.

---

2,769,762

**PRODUCTION OF NAPHTHAS OF IMPROVED CHARACTERISTICS BY TREATING WITH BAUXITE**

Weldon Grant Annable, Mundelein, Le Roi E. Hutchings, Crystal Lake, and Kenneth Lucas, Woodstock, Ill., assignors to The Pure Oil Company, Chicago, Ill., a corporation of Ohio

No Drawing. Application August 31, 1953, Serial No. 377,672
4 Claims. (Cl. 196—28)

1. The process for producing non-corrosive special solvent naphthas from petroleum hydrocarbon mixtures containing corrosive sulfur compounds which comprises subjecting said hydrocarbons to contact with bauxite at a temperature of 600° and 900° F., terminating said contact before hydrogen sulfide appears in the effluent therefrom, and fractionating the products to produce special solvent naphthas characterized by their ability to pass the distillation-corrosion test.

---

2,769,763

**METHOD FOR PRODUCING SPECIAL NAPHTHAS OF IMPROVED CHARACTERISTICS BY CONTACTING A REFINED NAPHTHA WITH SILVER MOLYBDATE AT ELEVATED TEMPERATURE**

Weldon Grant Annable, Mundelein, and Robert M. Haines, Crystal Lake, Ill., assignors to The Pure Oil Company, Chicago, Ill., a corporation of Ohio

No Drawing. Application July 26, 1954, Serial No. 445,930
6 Claims. (Cl. 196—28)

1. The method of producing special solvent naphthas from highly refined petroleum hydrocarbon mixtures containing small amounts of total sulfur of not more than about 0.16% by weight which comprises subjecting said hydrocarbon mixtures to contact with silver molybdate at a temperature of about 400 to 500° F. and separating special solvent naphthas therefrom characterized by their ability to pass the distillation-corrosion test.

---

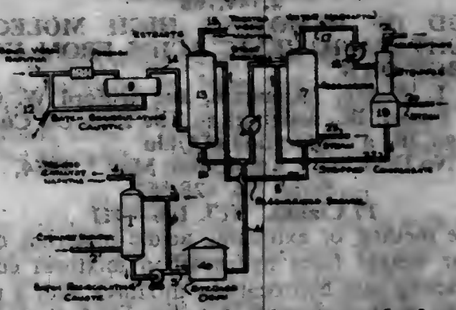
2,769,764

**METHOD FOR PRODUCING NAPTHAS OF IMPROVED CHARACTERISTICS FROM HIGHLY REFINED NAPHTHAS BY TREATING THE HIGHLY REFINED NAPHTHAS WITH A COPPER ACETATE**

Weldon Grant Annable, Mundelein, Ill., assignor to The Pure Oil Company, Chicago, Ill., a corporation of Ohio

No Drawing. Application April 1, 1954, Serial No. 420,462
7 Claims. (Cl. 196—28)

1. The method of producing special solvent naphthas from highly refined petroleum hydrocarbon mixtures containing small amounts of total sulfur of not more than about 0.025 weight percent which comprises subjecting said hydrocarbon mixtures to contact with a material selected from the group consisting of cuprie acetate and basic cupric acetate and their mixtures at temperatures of about 400 to 500° F. and separating special solvent naphthas therefrom characterized by their ability to pass the distillation-corrosion test.



---

2,769,765

**SWEETENING PROCESS**

Raymond L. Betts, Westfield, Horace F. Corning, Elizabeth, and Harold A. Ricards, Westfield, N. J., and James W. Ryder, North Reading, Mass., assignors to Esso Research and Engineering Company, a corporation of Delaware

Application November 19, 1952, Serial No. 321,486
2 Claims. (Cl. 196—32)

1. An improved process for the removal of mercaptan compounds from catalytic cracked oils and from virgin oils which comprises in combination washing in a washing zone said catalytic oil with an alkali metal hydroxide solution containing no more than about 30% by weight of alkali metal hydroxide, withdrawing spent hydroxide solution comprising mercaptides from said washing zone, passing said solution to a concentration zone, concentrating said solution to a strength corresponding to a hydroxide equivalent from about 40 to about 60%, thereafter contacting in a treating zone said virgin oil with said concentrated mercaptide-containing solution and maintaining a single phase operation in said last-named zone.

---

2,769,766

**IMPROVING MOTOR FUELS BY REFINING THEM WITH MALEIC ANHYDRIDE**

Hillis O. Folkins and Adolph Kempf, Crystal Lake, Ill., assignors to The Pure Oil Company, Chicago, Ill., a corporation of Ohio

No Drawing. Application July 16, 1953, Serial No. 368,517
2 Claims. (Cl. 196—39)

1. A method for improving the detonation characteristics of a petroleum derived, spark-ignited internal com-

bustion engine fuel which comprises thermally decomposing a gas oil in a fluid catalytic cracking process operated at a conversion of not less than about 55% to produce a catalytically cracked gasoline having a boiling range of from about 100° F. to about 400° F., separating said gasoline into a low boiling range fraction having the same initial boiling point as said gasoline and an end boiling point of about 300° F. and a high boiling range fraction having an end boiling point the same as said gasoline, said fractions having continuous boiling ranges, contacting said low boiling range fraction with 0.1–10% by weight of maleic anhydride to enhance the detonation characteristics of said low boiling range fraction, purifying said low boiling range fraction with an aqueous caustic solution followed thereafter by water washing, and reblending the thus treated low boiling range fraction with said higher boiling fraction to produce a full boiling range gasoline.

---

2,769,767

## METHOD OF SEPARATING ORGANIC ACIDS FROM PETROLEUM OILS BY EXTRACTING THE OIL WITH AN AQUEOUS MIXTURE OF AN AMINE AND AN ALCOHOL

William L. Fierce, Algonquin, and Gifford W. Crosby, River Forest, Ill., assignors to The Pure Oil Company, Chicago, Ill., a corporation of Ohio

Application July 3, 1953, Serial No. 365,814
10 Claims. (Cl. 196—41)

1. The process of separating organic acids from heavy petroleum fractions comprising contacting said fraction with a mixture of 10 to 15 percent of an aliphatic organic amine, 10 to 20 percent by volume of water, and 65 to 80 percent by volume of an alcohol having less than 7 carbon atoms per molecule.

---

2,769,768

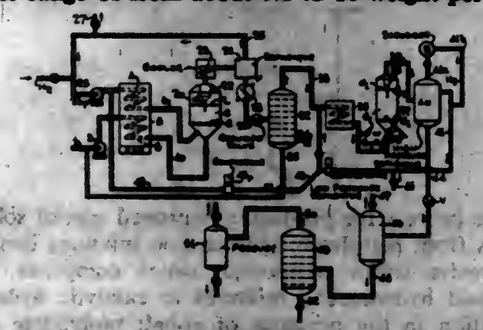
## METHOD OF REMOVING HIGH MOLECULAR WEIGHT NAPHTHENIC ACIDS FROM HYDROCARBON OILS

William L. Fierce, Algonquin, and Gifford W. Crosby, River Forest, Ill., assignors to The Pure Oil Company, Chicago, Ill., a corporation of Ohio

No Drawing. Application May 7, 1954, Serial No. 428,362
17 Claims. (Cl. 196—41)

1. The method of extracting acidic materials of high molecular weight from hydrocarbon mixtures comprising contacting said hydrocarbon mixtures with a solvent comprising methyl alcohol, at least one alcohol selected from the group consisting of straight chain monohydric primary alcohols having 4 to 7 carbon atoms per molecule and branched chain monohydric primary alcohols having 5 to 7 carbon atoms per molecule and mixtures thereof, and a sufficient amount of a basic agent to substantially neutralize the acid materials and recovering as the raffinate a hydrocarbon mixture substantially reduced in its content of acidic materials.

---



2,769,769

## TWO STAGE HIGH OCTANE GASOLINE PRODUCT

Charles W. Tyson, Summit, N. J., assignor to Esso Research and Engineering Company, a corporation of Delaware

Application April 12, 1951, Serial No. 220,556
3 Claims. (Cl. 196—49)

1. The method of producing high octane gasoline in a system comprising a hydrocracking zone and a hydroforming zone which comprises feeding gas oil to the hydrocracking zone containing a bed of hydrocracking catalyst consisting essentially of nickel sulfide and tungsten sulfide, in which the weight ratio of nickel sulfide to tungsten sulfide is 2:1, which sulfides are carried on a silica-alumina gel and which sulfides constitute about 10 weight percent of the said gel, simultaneously feeding to said reactor a hydrogen-containing gas produced in the system, maintaining the hydrocracking zone at a temperature from about 800°–950° F., a pressure of from about 2,000–3,000 p. s. i. g., and a feed rate of from about 0.2–2 lbs. of feed oil per lb. of catalyst in the reactor per hour, withdrawing a crude product from the hydrocracking zone, separating a fraction boiling up to about 400° F., charging the separated fraction to the hydroforming zone, contacting said fraction in said hydroforming zone with a hydroforming catalyst consisting essentially of platinum carried on active alumina, the amount of platinum being about 0.2–2.0 weight percent, the catalyst also containing from 0.1 to 10 weight percent of boron oxide and an amount of hydrogen fluoride within the range of from about 0.1 to 10 weight percent, the

foregoing percentages being based on the total weight of the catalyst, and feeding a hydrogen-containing gas to said hydroforming zone in an amount of from about 1,000–6,000 s. c. f. of hydrogen per barrel of oil feed, maintaining said hydroforming zone under a temperature of from about 875–975° F., a pressure of from about 100–500 p. s. i. g. and an oil feed rate of from about 0.2–5.0 lbs. of feed oil per hour per lb. of catalyst in the reactor, maintaining boron oxide and hydrogen fluoride on the catalyst in the said hydroforming zone by adding boron oxide and hydrogen fluoride to the catalyst in amounts required to replace these materials lost by volatilization, withdrawing crude product from the said hydroforming zone, recovering hydrogen from the crude product in a separation zone and recycling the latter to the hydrocracking zone and recovering a gasoline product of high octane value from said hydroforming zone.

---

2,769,770

## REMOVING ARSENIC FROM A NAPHTHA, WHICH IS REFORMED WITH A NOBLE METAL CATALYST COMPOSITE

Edward J. Bleek, La Grange, Ill., assignor to Universal Oil Products Company, Chicago, Ill., a corporation of Delaware

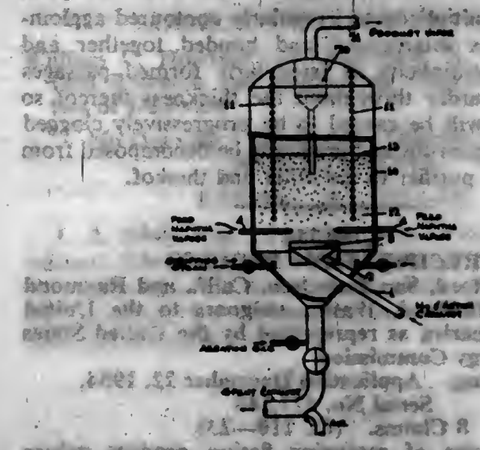
No Drawing. Application June 14, 1952, Serial No. 293,647
10 Claims. (Cl. 196—50)

1. The method of converting an arsenic-containing hydrocarbon charge which comprises irradiating the charge with ultra-violet light, separating therefrom a charge fraction having an arsenic content of less than about 0.05 parts per million and less than that of said charge, and subjecting said charge fraction to conversion in the presence of a catalyst comprising alumina and a noble metal.

---

2,769,771

## CONTACTING OF GASES WITH FLUIDIZED SOLIDS WITH THE USE OF CHAINS IN THE FLUIDIZED BED



Lindsay L. Griffin, Jr., Baton Rouge, La., assignor to Esso Research and Engineering Company, a corporation of Delaware

Application December 10, 1952, Serial No. 325,269
1 Claim. (Cl. 196—52)

In a process for converting hydrocarbons at conversion conditions wherein gasiform hydrocarbons are contacted

with finely divided solids by introducing finely divided solids into the lower portion of a conversion zone and by introducing a gasiform hydrocarbon into the lower portion of said conversion zone at a fluidizing velocity to maintain a dense turbulent fluidized bed of solids having a disperse phase of solids thereabove and gasiform hydrocarbons after contacting is withdrawn from said dilute phase and solids after contacting are withdrawn from said conversion zone and large gas bubbles are formed in said dense fluidized turbulent bed of solids to give uneven and poor contacting between the solids and gasiform hy-

drocarbon, the improvement which comprises contacting the dense fluidized bed of solids with a plurality of spaced dangling and movable chains fixedly attached at one end and extending downwardly in spaced parallel relation a substantial distance below the level of the dense fluidized bed of solids to break up large gas bubbles as they pass upwardly within said dense fluidized bed of solids into smaller gas bubbles to improve contacting between said solids and gasiform hydrocarbon and causing movement of said chains within said dense fluidized bed of solids solely by the turbulent motion of the turbulent dense fluidized bed of solids.

---

2,769,772

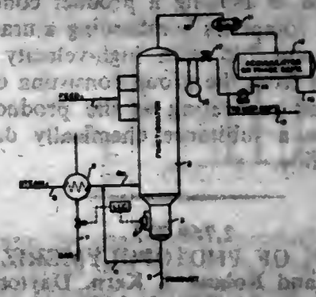
## PROCESS AND APPARATUS FOR HANDLING OF CARBONACEOUS OR REACTANT MATERIALS

Paul L. Gomory, Bethesda, Md., assignor to Phillips Petroleum Company, a corporation of Delaware

Application April 16, 1952, Serial No. 282,725
17 Claims. (Cl. 196—53)

1. In a process in which a stream of carbonaceous reactant is passed through a heating zone heated by radiant heating, the steps of surrounding said stream with a heat-carrying medium over a substantial length of passage of said stream through said zone, imparting heat to said medium in said zone over a substantial length of said stream and simultaneously causing the heated medium to pass into said stream, also over a substantial length thereof.

9. Heating apparatus comprising in combination: a furnace comprising a radiant heating zone and a convection zone; an impervious soaking coil in said convection zone; an impervious preheat coil in said radiant heating zone; a pervious conduit between said soaking coil and said preheating coil and connecting the interiors of said coils with each other; a tube enclosing said conduit and forming an annular space around said conduit; a conduit communicating with said annular space; means for supplying reactant to said preheat coil; means for supplying a fluid heat carrier to said tube enclosing said pervious conduit; means, independent of said furnace, for supplying heat to said heat carrier; means for withdrawing reacted material from said soaking coil; and means for returning heat carrier from said tube to said means for supplying heat to said heat carrier.



---

2,769,773

## METHYLETHYLPYRIDINE-METHYLVINYLPYRIDINE FRACTIONATION

William E. Burns, Pasadena, Tex., assignor to Phillips Petroleum Company, a corporation of Delaware

Application August 21, 1953, Serial No. 375,633
17 Claims. (Cl. 202—46)

1. In a process for the fractional distillation of a mixture of organic compounds wherein heat is supplied to the distillation zone by injection of a superheated steam, the improvement comprising maintaining the liquid level substantially constant in the distillation zone by adjusting the temperature of the injected superheated steam in response to variations in said liquid level.

---

2,769,774

## ELECTRODEPOSITION METHOD

Theron A. Loveland, Jr., Niles, and Alvin F. Prust, Warren, Ohio, assignors to Republic Steel Corporation, Cleveland, Ohio, a corporation of New Jersey

No Drawing. Application August 5, 1952, Serial No. 302,814
12 Claims. (Cl. 204—56)

1. The method of covering a metal article with a corrosion-resistant coating which comprises the steps of contacting the metal article with a liquid body consisting essentially of water and between about 10% and about 35% chromic acid and between about 3% and about 12% phosphoric acid in the ratio range to each other about two parts and about three parts of chromic acid per part of phosphoric acid, contacting a lead body with said liquid body at a point spaced from said metal article, electrically connecting said lead body and said article in an electric circuit as an anode and a cathode respectively, and passing an electric current of density between about 75 amperes and about 500 amperes per square foot of cathode surface through said electric circuit and through said liquid body as an electrolyte for between about one and about 20 seconds.

---

2,769,775

## ELECTROLYTE FOR COPPER REFINING, INCLUDING POLYVINYL ALCOHOL

John H. Schloen, Eugene M. Ellis, and Kurt Ekler, Montreal, Quebec, Canada, assignors to Canadian Copper Refiners Limited, Montreal, East Quebec, Canada, a corporation of Canada

No Drawing. Application December 1, 1953, Serial No. 395,622
8 Claims. (Cl. 204—108)

2. In the electrolytic refining of copper, involving passing an electric current between anodes of copper to be

refined and cathodes of pure copper immersed in an electrolyte comprising an aqueous solution of cupric sulphate and sulphuric acid, the improvement which comprises adding to said electrolyte from about 0.025 to about 0.08 pound of glue and from about 0.02 to about 0.14 pound of polyvinyl alcohol for each ton of copper deposited on the cathodes.

---

2,769,776

## METHOD OF MAKING A PRODUCT CONTAINING URANIUM 237

Allen F. Reid, New York, N. Y., assignor to the United States of America as represented by the United States Atomic Energy Commission

No Drawing. Application February 7, 1946, Serial No. 646,201
7 Claims. (Cl. 204—154)

1. The method of making a product containing uranium 237 which comprises bombarding a uranium halide containing uranium 238 with high-velocity sub-atomic particles selected from the group consisting of deuterons and neutrons and recovering as the product from the bombarded mass a substance chemically distinct from said uranium halide.

---

2,769,777

## INITIATION OF PHOTOPOLYMERIZATION

Gail H. Birum and Roland J. Kern, Dayton, Ohio, assignors to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application January 4, 1954, Serial No. 402,153
17 Claims. (Cl. 204—158)

1. In the photopolymerization of an ethylenically unsaturated monomer, the improvement which comprises employing a small amount of a compound, effective to photosensitize said polymerization, having the formula

R—O—S—R'

wherein R and R' are organic radicals each of which is attached to the —O—S— group through a carbon atom.

---

2,769,778

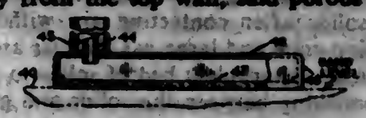
## METHOD OF MAKING TRANSPARENT CONDUCTING FILMS BY CATHODE SPUTTERING

John Silvey Preston, Teddington, England, assignor to National Research Development Corporation, London, England, a corporation of Great Britain

No Drawing. Application September 2, 1952, Serial No. 307,561
Claims priority, application Great Britain September 5, 1951
7 Claims. (Cl. 204—192)

1. The method of providing a surface of an article of heat resisting material with a thin electrically conductive film which comprises depositing on the surface by cathode sputtering, in the presence of oxygen insufficient in concentration to oxidise the metal completely, a thin yellow-to-brown coating, as uniform as may be, derived from a metal selected from the group consisting of metallic tin and metallic indium, and thereafter heating the coated surface under oxidising conditions until it becomes substantially transparent.

---



2,769,779

## WATER PURIFIER FOR AQUARIUMS

Mary Louise Mathilde Vanbeneden and Alfred Vanbeneden, Mouscron, France

Application August 27, 1953, Serial No. 376,857
1 Claim. (Cl. 210—16)

A water purifier for aquarium water containing microorganisms comprising a non-porous hollow vessel having top and depending side walls and a bottom opening, a porous flat purifier plate extending over the bottom opening in tight fitting engagement with the side walls and adapted to have contact over its full bottom face with the sand in the bottom of an aquarium when the purifier is rested thereupon, said hollow vessel having a water suction hole in the top wall thereof adjacent to one end of the purifier and a vertically-extending non-porous water pump chamber surrounding the suction hole and extending upwardly away from the top wall, said porous plate being

formed of a multiplicity of irregularly contoured agglomerated particles interrelated and bonded together and providing a multiplicity of irregularly formed passages extending upwardly throughout the thickness thereof so that the plate will be caused to be progressively clogged by the microorganisms and gradually be decomposed from one end of the purifier to the other end thereof.

---

2,769,780

## PRECIPITATION PROCESS

Warren E. Clifford, San Francisco, Calif., and Raymond E. Burns, Richland, Wash., assignors to the United States of America as represented by the United States Atomic Energy Commission

No Drawing. Application December 22, 1954, Serial No. 477,144
8 Claims. (Cl. 210—23)

6. The process of removing fission product values selected from the group consisting of cesium values and strontium values from aqueous solutions comprising adjusting the pH to a value between 8 and 11, adding alkali ferrocyanide to said solution, adding a water-soluble metal salt selected from the group consisting of cobalt salt and nickel salt to said solution whereby a precipitate forms and fission product values are carried on said precipitate, and separating the precipitate from the solution.

---

2,769,781

## KETTLE-COOLED LITHIUM STEARATE GREASE CONTAINING AN ALIPHATIC MONOHYDRIC ALCOHOL

Richard A. Babcock, East Hempstead, N. Y., assignor to Socony Mobil Oil Company, Inc., a corporation of New York

No Drawing. Application September 19, 1951, Serial No. 247,568
4 Claims. (Cl. 252—40)

4. A kettle-cooled, smooth-textured, lithium stearate grease comprising:

| | Percent by weight |
|---|---|
| Stearic acid | 5 to 20 |
| Hydroxy stearic acid | 0.5 to 5 |
| Sodium hydroxide | 0.1 to 1.0 |
| Lithium hydroxide monohydrate | 0.65 to 2.6 |
| Lime flour | 0.15 to 1.0 |
| Mineral oil 60 seconds to 3000 seconds, S. U. V. at 100° F | 93.5 to 68.4 |
| Oxidation inhibitor | 0.1 to 2.0 |
| Aliphatic monohydric alcohol having from 16 to 34 carbon atoms per molecule, the said alcohol constituting the sole gel stabilizer present in said grease | 0.1 to 0.5 |

---

2,769,783

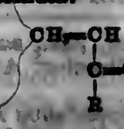
## LUBRICATING OIL ADDITIVE HAVING IMPROVED COPPER CORROSION PROPERTIES

Julius P. Recon and Albert C. Haas, Linden, N. J., assignors to Esso Research and Engineering Company, a corporation of Delaware

No Drawing. Application October 26, 1953, Serial No. 388,640
6 Claims. (Cl. 252—42.7)

1. In the process in which an oil-soluble sulfur and phosphorus-containing product having antioxidant properties in the presence of organic materials is formed by reacting together a metal alkyl phenol sulfide and $P_2S_5$ at a temperature in the range of about 100° to 200° C., the improvement for reducing the tendency of the product to corrode metals which comprises utilizing a metal phenol sulfide which contains less than about 0.3 weight percent water and a mol ratio of $P_2S_5$ to said metal phenol sulfide below 0.25:1.0.

---



2,769,783

## LUBRICATING COMPOSITIONS

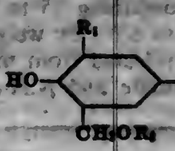
William C. Holliday, Jr., Fanwood, N. J., assignor to Esso Research and Engineering Company, a corporation of Delaware

No Drawing. Application October 15, 1952, Serial No. 314,943
6 Claims. (Cl. 252—45)

1. A lubricating oil composition which comprises a mineral lubricating oil containing from 0.005% to 60% by weight based on the total composition, of a condensation product of a polymer prepared by polymerizing a material having the formula:

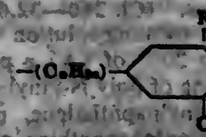
wherein R is selected from the class consisting of hydrogen and methyl groups, at a temperature of from about 15° C. to 125° C. for from about 1 to 50 hours in the presence of from about 0.1% to 5% by weight, based on the weight of the polymerizable material, of a peroxide type catalyst, and reacting the polymer so formed with about 50% to 150% of the theoretical amount needed to react with the polymer, of an aliphatic material selected from the class consisting of primary and secondary amines, mercaptans and alcohols containing from 8 to 18 carbon atoms.

---



2,769,784

## ALKYLATED PHENOLS AND STABILIZED COMPOSITIONS COMPRISING SAME



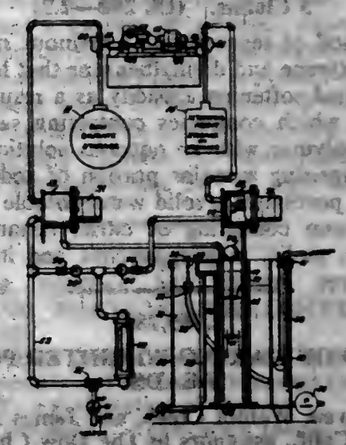
David W. Young, Westfield, and Delmer L. Cottle, Highland Park, N. J., assignors to Esso Research and Engineering Company, a corporation of Delaware

No Drawing. Application July 23, 1954, Serial No. 445,675
10 Claims. (Cl. 252—52)

1. A phenolic anti-oxidant having the formula

wherein $R_1$ is selected from the group consisting of hydrogen and $-CH_2OR_3$ radicals, $R_2$ is a branched-chain alkyl radical of 8 to 15 carbon atoms, and $R_3$ is selected from the group consisting of alkyl radicals of 1 to 4 carbon atoms, alkoxy radicals of 1 to 4 carbon atoms, and alkyl phenol radicals represented by the structure

where $x$ is an integer ranging from 1 to 4 and $R_2$ is an alkyl radical of 8 to 15 carbon atoms.



---

2,769,785

## CONTINUOUS SILICA SOL APPARATUS

James D. Walker, Aurora, Ill., assignor to B-I-F Industries, Inc., Providence, R. I., a corporation of Rhode Island

Application September 2, 1950, Serial No. 182,951
5 Claims. (Cl. 252—359)

1. Apparatus for continuously producing aged ungelled silica sol, including tank means forming a mixing chamber, an aging chamber communicating therewith, and a makeup chamber, means for supplying raw sodium silicate at a known rate, means for mixing the sodium silicate with water supplied at a known rate, and delivering the mixture to the mixing chamber, means for supplying activating agent at a known rate, means for mixing it with water supplied at a known rate, and delivering the activating mixture to the mixing chamber, means for violently agitating the contents of the mixing chamber, means for supplying additional water to the makeup chamber to dilute the aged mixture flowing to it from the aging chamber, means to maintain the liquid level therein substantially below the liquid level in the mixing chamber, and draw-off means in the aging tank adjustable in height to control the liquid level therein and discharging into said makeup tank.

---

2,769,786

## PRODUCTION OF POLYMERS FROM AROMATIC AND THE LIKE COMPOUNDS

Michael Mojzesz Suware, Syracuse, N. Y., and Alec Norman Roper and Herbert Max Emil Stelmer, Manchester, England, assignors, by mesne assignments, to The M. W. Kellogg Company, Jersey City, N. J., a corporation of Delaware

No Drawing. Application August 28, 1952, Serial No. 306,939
Claims priority, application Great Britain August 29, 1951
10 Claims. (Cl. 260—2)

9. In the production of polymeric products in the form of flakes, the process which comprises pyrolyzing the vapors of a polymethyl benzene having two methyl substituents in the para positions and at least one additional methyl substituent in the ring, by heating said vapors in admixture with steam in molecular proportions ranging from about 10 to 100 moles of steam to 1 mole of the polymethyl benzene vapors to a temperature of from about 700° to 1000° C. for a time ranging from about 1 second to 0.02 second and under a total pressure of steam and polymethyl benzene vapors not exceeding 200 mm. mercury absolute, cooling the pyrolyzed vapors to a temperature of from about 50° to 0° C. to precipitate the resulting polymer, washing and drying to recover the polymer in flake form.

2,769,787

## METHOD FOR REGENERATION OF CATION EXCHANGERS

Horace W. Diamond, Chicago, Ill., assignor to Morton Salt Company, Chicago, Ill., a corporation of Illinois

No Drawing. Application June 4, 1954, Serial No. 434,645

3 Claims. (Cl. 260—2.2)

1. A method of regenerating a resinous sulfonated copolymer of styrene and divinylbenzene that has a substantially exhausted softening capacity as a result of treating hard water, which comprises contacting said exhausted resinous copolymer with an aqueous solution of a composition comprising a major portion of sodium chloride and a minor portion of a solid water-soluble acid selected from the group consisting of citric, tartaric, sulfamic, sulfosalicylic, malic, maleic, succinic and itaconic acids.

2,769,788

## METHOD OF MAKING WEIGHTED POLYMER BEADS

Paul M. Craven, Walnut Creek, and James A. Patterson, Concord, Calif., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Application October 1, 1952, Serial No. 312,668

6 Claims. (Cl. 260—17)

1. A method which comprises treating a finely divided solid material, which has an absolute density of at least 2.5 and is of not larger than 80 mesh particle size and which is insoluble in and chemically inert to vinyl aromatic compounds and their polymers, with an agent which, when applied to water-wettable solid material, renders the latter repellent to water and wettable by organic liquids, admixing the thus-treated solid material with at least one liquid vinyl aromatic hydrocarbon to form a slurry of the solid particles and the liquid vinyl aromatic hydrocarbon, agitating the slurry together with a larger volume of an aqueous salt solution that is non-solvent for said slurry and has at least 0.5 percent by weight of a strongly ionized inorganic salt dissolved therein, to form a suspension of droplets of said slurry in the aqueous salt solution while heating the agitated mixture to cause polymerization of the vinyl aromatic hydrocarbon, whereby there are formed substantially spherical solid beads of the polymerized vinyl aromatic hydrocarbon having the finely divided solid starting material embedded therein.

2,769,789

## RUBBER REINFORCING AGENTS AND COMPOSITIONS CONTAINING SUCH AGENTS

Evelyn William Madge, Sutton Coldfield, Wyndham Mobberley, Bournville, and Frederick Joseph Tilcaham, Castle Bromwich, England, assignors to Dunlop Tire and Rubber Corporation, Buffalo, N. Y., a corporation of New York

No Drawing. Application January 7, 1953, Serial No. 330,164

Claims priority, application Great Britain January 15, 1952

8 Claims. (Cl. 260—17.5)

1. A reinforced rubber composition comprising rubber and a compound incorporated therein said compound being a hydrophilic lignin compound having its base exchanged with the cationic component of an organic compound containing a cationic radical having a chain of at least ten carbon atoms to form a direct union of the lignin radical and the cationic radical.

2,769,790

## BLENDED ASPHALTIC COMPOSITIONS

Murray H. Eilers, Railway, and Thomas B. Tutwiler, Watchung, N. J., assignors to Esso Research and Engineering Company, a corporation of Delaware

No Drawing. Application April 23, 1952, Serial No. 283,969

3 Claims. (Cl. 260—28.5)

1. An asphalt composition having a ductility of at least 3.5 and consisting of an asphalt containing about 0.1 to 20% by weight of a polymeric vinyl ether compound, said polymeric ether being a polymer of a polymerizable mixture consisting of at least one ether having the formula:

$$R-O-C=CH_2$$
$$\quad\quad H$$

in which R is selected from the group consisting of alkyl and alkoxy-alkyl radicals having about 1 to 20 carbon atoms, and said polymer having a Staudinger molecular weight of about 2,000 to 100,000.

2,769,791

## COMPOSITION COMPRISING N-NITROSOPIPERIDINE AND A COPOLYMER OF ACRYLONITRILE

George E. Hass, Decatur, Ala., assignor to The Chemstrand Corporation, Decatur, Ala., a corporation of Delaware

No Drawing. Application June 10, 1953, Serial No. 360,828

12 Claims. (Cl. 260—30.2)

8. A new composition of matter, comprising a homogeneous miscible mixture of 65 to 95 percent by weight of N-nitrosopiperidine and from five to 35 percent of a copolymer of from 70 to 98 percent by weight of acrylonitrile and from two to 30 percent of methacrylonitrile.

2,769,792

## FIBER-FORMING VINYL CHLORIDE COPOLYMER BLENDS WITH ACRYLONITRILE POLYMERS

George E. Hass, Dayton, Ohio, assignor, by mesne assignments, to The Chemstrand Corporation, a corporation of Delaware

No Drawing. Application November 5, 1951, Serial No. 254,977

5 Claims. (Cl. 260—32.6)

1. A new composition of matter capable of being formed into heat-stable fibers and filaments comprising a homogeneous solution containing a polymeric blend of 5 to 25 parts by weight of (A) a polymer containing at least 85% by weight of acrylonitrile and up to 15% of another polymerizable mono-olefinic monomer copolymerizable therewith, and 75 to 95 parts by weight of (B) a copolymer containing 35 to 70% by weight of vinyl chloride and 30 to 65% by weight of acrylonitrile, dissolved in a solvent selected from the group consisting of N,N-dimethylformamide and N,N-dimethylacetamide.

2,769,793

## FIBER-FORMING ACRYLONITRILE POLYMER BLENDS

George E. Hass, Dayton, Ohio, assignor, by mesne assignments, to The Chemstrand Corporation, a corporation of Delaware

No Drawing. Application May 24, 1951, Serial No. 228,130

11 Claims. (Cl. 260—32.6)

1. A heat-stable fiber-forming solution which comprises a blend of from 0.1 to 20% of (A) a polymer selected from the group consisting of poly N-vinyl-carbazole, polyvinylanthracene, polyvinylnaphthalene, polyvinylpyrene, polyvinylfluorene, polyvinylphenoxthine, polyacenaphthylene, polyvinylbiphenyl, polyisopropenylbiphenyl and polyvinylacenaphthene, and from 80 to 99.9% of (B) a polymer selected from the group consisting of polyacrylonitrile, copolymers of at least 85% acrylonitrile and not more than 15% of another polymerizable mono-olefinic monomer copolymerizable therewith, and blends of said acrylonitrile polymer and co-polymers containing at least 85% of acrylonitrile with a polymer of at least 30% of a vinylpyridine and up to 70% of another polymerizable mono-olefinic monomer copolymerizable therewith, both (A) and (B) being dissolved in N,N-dimethylacetamide.

2,769,794

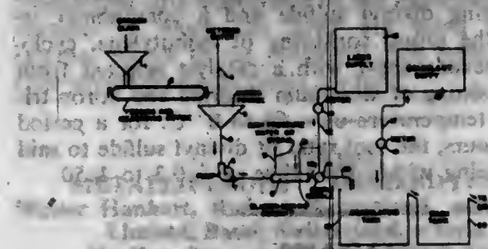
## WATER VAPOR IMPERVIOUS SYNTHETIC RESIN COMPOSITION

Myron A. Coler, New York, N. Y., and Herbert A. Gottschall, Clifton, N. J., assignors to Myron A. Coler, New York, N. Y.

No Drawing. Application March 4, 1953, Serial No. 340,394

6 Claims. (Cl. 260—41)

1. A composition comprising a resinous synthetic material selected from the group consisting of polyethylene, polymethyl-methacrylate and polystyrene and between 1% and 20% by weight of an agent selected from the group consisting of plaster of Paris and Portland cement.



2,769,795

## METHOD OF COMPOUNDING CARBON BLACK AND RUBBER

Harold A. Brasselle, Garden City, N. Y., assignor to Columbian Carbon Company, New York, N. Y., a corporation of New York

Application February 1, 1956, Serial No. 562,900

13 Claims. (Cl. 260—41.5)

1. In the process of producing dispersions of carbon black in rubber in which the black is mixed with the rubber while in latex form and the carbon black-latex mixture thereafter coagulated, the steps of continuously mixing the carbon black in a uniform, predetermined proportion with a flowing stream of water under conditions of violent hydraulic turbulence and impact, and thereby forming a continuously flowing, confined stream of an aqueous carbon black slurry of uniform composition, immediately, and substantially instantaneously, uniformly mixing a stream of the latex in uniform, predetermined proportions with the resultant stream of slurry under conditions of violent hydraulic turbulence and impact and, immediately following the mixing, coagulating the resultant mixture by adding a coagulating agent thereto with agitation.

2,769,796

## MELAMINE-FORMALDEHYDE-POLYAMINE CONDENSATION PRODUCT

Tsung Jiaoq Soon, New Canaan, and Yun Jen, Stamford, Conn., assignors to American Cyanamid Company, New York, N. Y., a corporation of Maine

No Drawing. Application March 20, 1953, Serial No. 343,792

21 Claims. (Cl. 260—45.2)

2. The process of preparing a water-soluble resinous material which comprises reacting melamine, formaldehyde and a polyfunctional aliphatic polyamine condensation product selected from the group consisting of (1) ammonia and a difunctional halohydrin, (2) a polyalkylene polyamine and a difunctional halohydrin and (3) a polyalkylene polyamine and a dihaloalkane at a temperature between about 20° C. and about 100° C. until a viscosity of between about 20 centipoises and about 800 centipoises measured at 35% solids and 25° C. is obtained, thereafter neutralizing said resinous material, wherein the formaldehyde is present in an amount greater than 6 mols per mol of melamine, wherein said polyamine has a carbon to nitrogen ratio not greater than 4:1, respectively, and the polyfunctional aliphatic polyamine condensation product is present in an amount to yield between about 0.5 and about 10 atoms of nitrogen per mol of melamine and wherein the product produced is infinitely dilutable in neutralized water at a temperature between about 25° C. and 30° C.

2,769,797

## MELAMINE RESINS MODIFIED WITH POLYALKYLENE POLYAMINE-HALOHYDRIN CONDENSATES

Tsung Jiaoq Soon, New Canaan, and Yun Jen, Stamford, Conn., assignors to American Cyanamid Company, New York, N. Y., a corporation of Maine

No Drawing. Application July 6, 1955, Serial No. 520,359

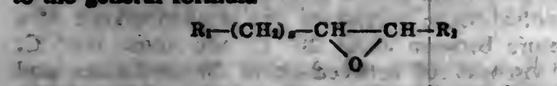
12 Claims. (Cl. 260—45.2)

1. The process of preparing a water soluble resinous composition comprising the reaction product of melamine, formaldehyde and a polyfunctional aliphatic polyamine condensation product selected from the group consisting of (1) ammonia and a difunctional halohydrin, (2) a polyalkylene polyamine and a difunctional halohydrin and (3) a polyalkylene polyamine and a dihaloalkane wherein the formaldehyde is present in a total amount of at least 8 moles per mole of melamine which comprises reacting a partially polymerized melamine-formaldehyde condensation product having a melamine to formaldehyde mole ratio of from about 1:1.5 to 1:5 respectively, which has been reacted to a point beyond the methylol stage, but short of the gel stage, at a temperature of between about 20° C. and 100° C. with a polyfunctional aliphatic polyamine condensation product providing a carbon to nitrogen ratio not greater than 4:1 respectively, in an amount sufficient to yield between about 0.3 and 10 atoms of nitrogen per mole of melamine; introducing additional amounts of formaldehyde until there is present a mole ratio of melamine to formaldehyde within the range of 1:6 to about 1:14 respectively, continuing the reaction until a viscosity of about 20 centipoises and 800 centipoises measured at 35% solids and 25° C. is obtained; inhibiting further reaction by substantially neutralizing the reaction product, and adding thereto formaldehyde in an amount sufficient to bring the mole ratio of the melamine to total formaldehyde charged to at least 1:8 respectively.

2,769,798

## AMINOPLAST RESINS AND AMINOPLAST RESIN COMPOSITIONS STABILIZED WITH OXIRANE COMPOUNDS AND PROCESS OF PREPARING SAME

Helmut Meis, Walter Scheib, and Karl-Heinz Decker, Lotmathe in Westphalia, Germany, assignors to Ruhrgerwerke-Aktiengesellschaft, Frankfurt am Main, Germany



No Drawing. Application June 26, 1953, Serial No. 364,482

Claims priority, application Germany July 7, 1952

6 Claims. (Cl. 260—45.8)

1. A composition comprising a heat-hardenable amine-formaldehyde resin selected from the group consisting of urea-, thiourea-, imino-urea-, and melamine-formal-

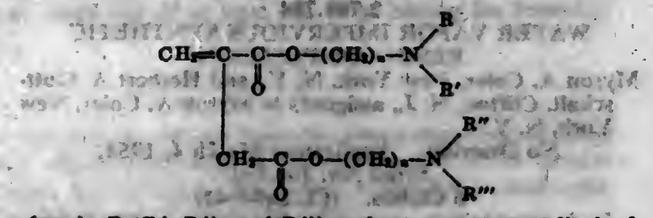
dehyde resins and a stabilizing compound corresponding to the general formula

wherein $R_1$ stands for an organic radical selected from a first group consisting of acyl, carboxyl, alkoxy, cycloalkoxy, aroxy, alkaroxy, aralkoxy, alkyl, cycloalkyl, aryl, and aralkyl radicals, a second group consisting of radicals of said first group substituted by a hydroxy radical, a third group consisting of radicals of said first group substituted by a primary amino radical and a fourth group consisting of radicals of said first group substituted by a secondary amine radical; $R_2$ stands for a radical selected from the group consisting of H and a radical of said first, second, third and fourth groups, and $x$ is an integer having a value in the range of 1–10.

---

**2,769,799**
**POLYAMINE MODIFIED MELAMINE RESINS**
Tzeng Jiuey Suen, New Canaan, and Yun Jen, Stamford, Conn., assignors to American Cyanamid Company, New York, N. Y., a corporation of Maine
No Drawing. Application March 20, 1953, Serial No. 343,791
18 Claims. (Cl. 260—67.6)

1. The process of preparing a water-soluble resinous material which comprises reacting melamine, formaldehyde and a polyfunctional aliphatic polyamine at a temperature between about 20° C. and about 100° C. until a viscosity of between about 20 centipoises and about 800 centipoises measured at 35% solids and 25° C. is obtained, thereafter neutralizing said resinous material, wherein the formaldehyde is present in an amount greater than 6 mols per mol of melamine, wherein said polyamine has a carbon to nitrogen ratio not greater than 4:1, respectively, and the polyfunctional aliphatic polyamine is present in an amount to yield between about 0.5 and about 10 atoms of nitrogen per mol of melamine, and wherein the product produced is infinitely dilutable in neutralized water at a temperature between about 25° C. and 30° C.



---

**2,769,800**
**POLYAMINE MODIFIED MELAMINE-FORMALDEHYDE RESINS**
Tzeng Jiuey Suen, New Canaan, and Yun Jen, Stamford, Conn., assignors to American Cyanamid Company, New York, N. Y., a corporation of Maine
No Drawing. Application July 6, 1955, Serial No. 520,358
12 Claims. (Cl. 260—67.6)

1. The process of preparing a water-soluble resinous material comprising the reaction product of melamine, formaldehyde and a polyfunctional aliphatic polyamine wherein the formaldehyde is present in a total amount of at least 8 mols per mol of melamine which comprises treating a partially polymerized melamine-formaldehyde condensation product having a melamine to formaldehyde mol ratio of from about 1:1.5 to 1:5, respectively, at a temperature between about 20° C. and 100° C. with a polyfunctional aliphatic polyamine providing a carbon to nitrogen ratio not greater than 4:1, respectively, in an amount sufficient to yield between about 0.5–10 atoms of nitrogen per mol of melamine; introducing formaldehyde until the mol ratio of melamine to formaldehyde lies within the range of from 1:6 to 1:15, respectively; reacting the mixture until an end point viscosity of between about 20 centipoises and 800 centipoises measured at 35% solids and 25° C. is obtained; inhibiting further reaction by substantially neutralizing the polymerized product and adding to the reaction product additional formaldehyde in an amount sufficient to bring the mol ratio of the melamine to total formaldehyde charged to at least 1:8, respectively.

**2,769,801**
**DYEABLE COPOLYMERS OF ACRYLONITRILE AND AMINOESTERS OF ITACONIC ACID**
George E. Ham, Decatur, Ala., assignor to The Chemstrand Corporation, Decatur, Ala., a corporation of Delaware
No Drawing. Application March 16, 1953, Serial No. 342,720
7 Claims. (Cl. 260—78.5)

1. A copolymer of from 80 percent to 99.5 percent by weight of acrylonitrile and from 0.5 percent to 20 percent by weight of a compound having the formula:

wherein R, R′, R″, and R‴ each represents a radical of the group consisting of alkyl radicals having no more than four carbon atoms, and $n$ represents a whole number from two to four inclusive.

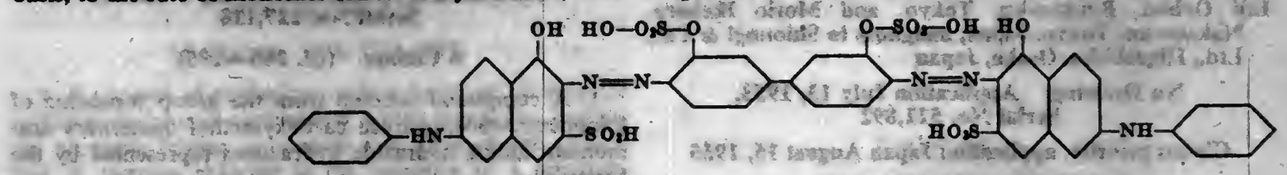
---

**2,769,802**
**POLYMERS OF DIVINYL SULFIDE AND METHODS FOR THEIR PRODUCTION**
James E. Pritchard, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware
No Drawing. Application December 8, 1952, Serial No. 324,825
4 Claims. (Cl. 260—79.7)

1. A process for producing a copolymer which comprises contacting divinyl sulfide and a comonomer selected from the group consisting of isobutylene, cyclohexene and hexadecene-1 with a catalyst selected from the group consisting of aluminum chloride and boron trifluoride, at a temperature of −60 to 0° C. for a period of 0.5 to 20 hours, the mol ratio of divinyl sulfide to said comonomer being within the range of 1:0.3 to 1:50.

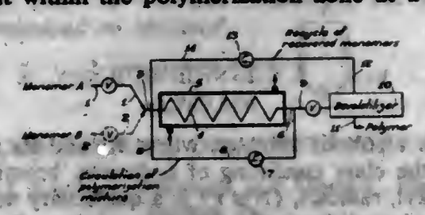
---

**2,769,803**
**COPOLYMERS OF VINYL CHLORIDE AND 1,1-DICHLORO-ETHENE**
Wilhelm Becker, Leverkusen-Bayerwerk, Germany, assignor to Farbenfabriken Bayer Aktiengesellschaft, Leverkusen, Germany, a corporation of Germany
No Drawing. Application March 31, 1953, Serial No. 346,021
Claims priority, application Germany April 17, 1952
4 Claims. (Cl. 260—80.5)



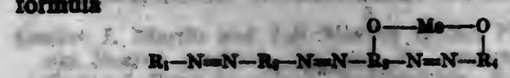
4. A liquid coating composition comprising, as a film forming agent, a copolymer prepared by a process which comprises emulsifying at least 15% vinylchloride, at least 15% 1,1-dichloroethene and 1–25% styrene, said percentages being calculated on a total weight of said monomers, in an aqueous medium and copolymerizing said monomers in a single step in the presence of about 0.05 to about 0.5% of a regulating agent; and a solvent for said film forming agent.

---



**2,769,804**
**CONTINUOUS METHOD FOR MAKING SOLID POLYMERIC MATERIALS**
Alden W. Hanson, Midland, Mich., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware
Application September 10, 1951, Serial No. 245,234
13 Claims. (Cl. 260—86.7)

1. A method for the copolymerization of vinylidene compounds in a continuous manner which comprises feeding at least two copolymerizable liquid monomeric vinylidene compounds to a polymerization zone where the resulting mixture is agitated at a polymerization temperature with resultant formation of a mixture of copolymeric material and unreacted monomeric material, withdrawing a stream of the incompletely polymerized mixture from said zone, vaporizing the unreacted monomeric material from the stream and returning it, within the polymerization system, to the polymerization zone, and discharging the residual copolymeric material from the polymerization system at a rate corresponding approximately, on a weight basis, to the rate of monomer fed to the system and, while



continuing said operations, maintaining the mixture at each point within the polymerization zone at a substantially constant temperature and feeding monomeric material to the mixture at a rate sufficient to prevent the mixture from becoming completely polymerized, the ratio of one monomer to another in the feed to the polymerization system being maintained substantially constant, whereby the copolymer being formed in early stages of the process is caused, by the above-stated operations, to vary and approach that of a copolymer of the monomers in the proportions in which the latter are being fed from an external source to the polymerization system and thereafter to remain substantially constant.

---

**2,769,805**
**METALLIFEROUS TRISAZO-DYESTUFFS**
Walter Hunbart, Richen, Switzerland, assignor to Ciba Limited, Basel, Switzerland, a Swiss firm
No Drawing. Application March 23, 1953, Serial No. 344,283
Claims priority, application Switzerland March 31, 1952
10 Claims. (Cl. 260—145)

1. A metalliferous trisazo dyestuff of the general formula

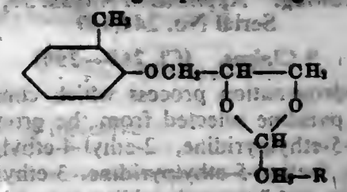
wherein $R_1$ stands for the radical of a diazo component containing at least one sulfonic acid group and selected from the group consisting of aminobenzenes, aminonaphthalenes, aminodiphenyls and 2-(4′-aminophenyl)-benzthiazoles, $R_3$ stands for an aromatic radical containing only carbocyclic rings and at most 10 aromatically bound carbon atoms carrying both azo groups attached thereto in para positions to one another, $R_3$ stands for a benzene radical carrying both azo groups in para positions to one another, $R_4$ stands for the radical of a member selected from the group consisting of hydroxynaphthalenes free from amino groups and coupling in ortho position to a hydroxyl group and 1-phenyl-3-methyl-5-pyrazolones, and Me stands for a member selected from the group consisting of the metals nickel and copper, the whole azo dyestuff containing at least three and at most six sulfonic acid groups, the metallized hydroxyl group indicated in the formula being the sole hydroxyl group bound to $R_1$, $R_2$ and $R_3$, and the group

being bound to vicinal positions with respect to the azo group.

**2,769,806**
**DISAZO-DYESTUFFS**
Oscar Weber, Reinach, Switzerland, assignor to Ciba Limited, Basel, Switzerland, a Swiss firm
No Drawing. Application April 6, 1953, Serial No. 347,147
Claims priority, application Switzerland April 10, 1952
6 Claims. (Cl. 260—182)

2. A disazo-dyestuff which in its free acid form corresponds to the formula

---



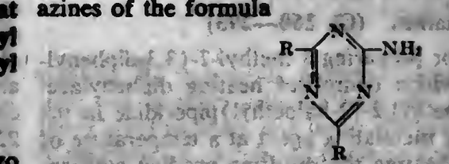
**2,769,807**
**PRODUCTION OF CAPROLACTAM**
Lorraine Guy Donaruma, Woodbury, N. J., and David C. England, Wilmington, Del., assignors to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application May 21, 1954, Serial No. 431,597
8 Claims. (Cl. 260—239.3)

1. A process for the preparation of lactams which comprises reacting an aqueous solution of a water-soluble salt of a nitro cycloalkane with a sulfuric acid solution of a primary nitro alkane, said sulfuric acid being present throughout the reaction in an amount by weight at least equal to the amount of water and the temperature during said reaction being maintained between 100 and 170° C.

---

**2,769,808**
**DIOXOLANE COMPOUNDS**
Leon E. Tenenbaum, Brooklyn, N. Y., assignor to Nepera Chemical Co., Inc., Yonkers, N. Y., a corporation of New York
No Drawing. Application August 13, 1953, Serial No. 374,161
5 Claims. (Cl. 260—247.7)

1. Compounds of the group consisting of



wherein R is a substituted amino group linked through nitrogen to the methylene group and is selected from the group consisting of lower alkylamino and di-lower-alkylamino groups wherein the alkyl group contains from one to four carbon atoms, piperidino, morpholino and pyrrolidino, groups, and their water-soluble salts.

---

**2,769,809**
**TRIAZINE COMPOUNDS AND METHOD**
George H. Hitchings, Tuckahoe, and Peter Byrom Russell, Crestwood, N. Y., assignors to Burroughs Wellcome Co. (U. S. A.) Inc., Tuckahoe, N. Y., a corporation of New York
No Drawing. Application November 6, 1951, Serial No. 255,136
Claims priority, application Great Britain November 10, 1950
4 Claims. (Cl. 260—249.5)

1. A method of preparing 2-amino-4,6-diaryl-1,3,5-triazines of the formula

wherein R is selected from the class consisting of the

phenyl, pyridyl and pyrimidyl radicals attached to a carbon atom of the triazine by a —C—C— bond, which comprises reacting a nitrile of the formula RCN with guanidine.

---

2,769,810

## PROCESS FOR PREPARING HYDROXY-N-METHYLMORPHINAN

Eiji Ochiai, Bunkyo-ku, Tokyo, and Morio Ikehara, Nakano-ku, Tokyo, Japan, assignors to Shionogi & Co., Ltd., Higashi-ku, Osaka, Japan

No Drawing. Application July 13, 1955, Serial No. 521,892

Claims priority, application Japan August 15, 1955

4 Claims. (Cl. 260—285)

1. A process for preparing hydroxy-N-methylmorphinan which comprises condensing 1-chloro-5,6,7,8-tetrahydroisoquinoline with lower alkoxybenzyl cyanide which has no alkoxy radical at least on one side of the ortho positions in the presence of a condensing agent selected from the group consisting of alkali metal amide and alkaline earth metal amide, reacting 1-(α-carbamoyl)alkoxybenzyl-5,6,7,8-tetrahydroisoquinoline obtained by the hydrolysis of the resulting 1-(α-cyano)alkoxybenzyl-5,6,7,8-tetrahydroisoquinoline with methyl iodide to methiodide thereof, reducing the methiodide by means of platinum catalyst to 1-(α-carbamoyl-alkoxybenzyl - N - methyl-1,2,3,4,5,6,7,8-octahydroisoquinoline, and then treating the latter with a strong acidic condensing agent selected from the group consisting of concentrated phosphoric acid and concentrated hydrohalogenic acid to produce the object.

---

2,769,811

## PRODUCTION OF ALKENYL PYRIDINES

John E. Mahan, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware

No Drawing. Application August 30, 1951, Serial No. 244,469

9 Claims. (Cl. 260—290)

1. A dehydrogenation process which comprises passing an alkyl pyridine selected from the group consisting of 2-methyl-5-ethylpyridine, 2-ethyl-4-ethylpyridine, 2-ethylpyridine, 2-ethyl-5-ethylpyridine, 3-ethylpyridine, 3-propylpyridine, and 2-n-amylpyridine over a catalyst comprising a major proportion by weight of iron oxide, a minor proportion by weight of chromium oxide, and a minor proportion by weight of a compound selected from the group consisting of alkali metal oxides, hydroxides, and carbonates at a temperature in the range from 1000° to 1300° F. to thereby produce an alkenyl pyridine corresponding to said alkyl pyridine.

---

2,769,812

## 1-METHYL-2-(3,3-DIPHENYLPROPYL)PIPERIDINE AND PREPARATION THEREOF

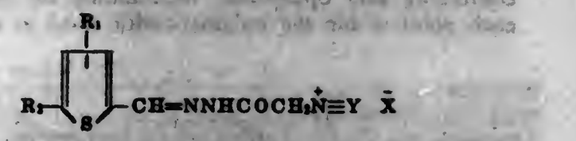
Arlo Wayne Ruddy, Albany, N. Y., assignor to Sterling Drug Inc., New York, N. Y., a corporation of Delaware

No Drawing. Application August 15, 1950, Serial No. 179,641

2 Claims. (Cl. 260—293)

1. The process for preparing 1-methyl-2-(3,3-diphenylpropyl)piperidine which comprises heating diphenylacetonitrile with a 1-methyl-2-(2-haloethyl)piperidine in the presence of a strong metalating agent at a temperature of about 50° C., and heating the resulting product with sodium amide at a temperature of at least about 80° C.

2,769,813



## CARBOXYMETHYL QUATERNARY AMMONIUM HALIDES, HYDRAZIDES AND HYDRAZONES WITH THIOPHENECARBOXALDEHYDES

Edward C. Hermann, Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application May 18, 1951, Serial No. 227,118

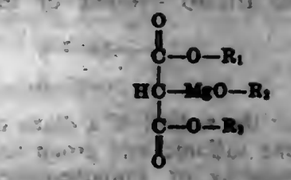
6 Claims. (Cl. 260—295)

1. A compound selected from the group consisting of thiophenecarboxaldehyde carboxymethyl quaternary ammonium halide hydrazide hydrazones represented by the formula

and their alcoholic solvates, where $R_1$ and $R_2$ are members of the class consisting of hydrogen, bromine, nitro, lower alkyl, radicals, (N≡Y) is a quaternary ammonium radical selected from the group consisting of trimethylammonium, triethylammonium, phenyldimethylammonium, dimethylallylammonium, morpholinium and pyridinium and X is a member of the group consisting of chlorine and bromine.

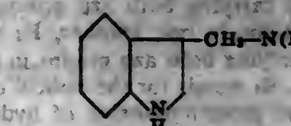
---

2,769,814



## PROCESS FOR MAKING DIALKYL (3-INDOLYLMETHYL) MALONATES

Ethan C. Galloway, Midland, Mich., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware



No Drawing. Application March 1, 1956, Serial No. 568,713

8 Claims. (Cl. 260—319)

1. A process for making a dialkyl-(3-indolylmethyl) malonate which comprises reacting a dialkyl-(alkoxymagnesium) malonate having the general formula:

wherein $R_1$, $R_2$ and $R_3$ each represents an alkyl radical containing from 1 to 3 carbon atoms and a 3-dialkylaminomethylindole having the general formula:

wherein R represents an alkyl radical containing from 1 to 3 carbon atoms, by heating a mixture of the reactants in proportions corresponding to from 1 to 2 gram molecular proportions of the dialkyl-(alkoxymagnesium) malonate per gram molecular proportion of the 3-dialkylaminomethylindole at temperatures between 110° and 225° C. in admixture with an inert liquid organic compound boiling at temperatures between 110° and 225° C. at 760 millimeters absolute pressure as a reaction medium and distilling by-product dialkylamine from the reaction at substantially the rate at which it is formed.

2,769,815

## REPLACEMENT OF BROMINE BY CHLORINE IN AROMATIC COMPOUNDS

William B. Hardy, Bound Brook, and Robert B. Fortenbaugh, Gladstone, N. J., assignors to American Cyanamid Company, New York, N. Y., a corporation of Maine

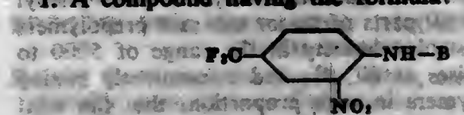
No Drawing. Application April 14, 1953, Serial No. 348,834

19 Claims. (Cl. 260—325)

1. A process of replacing nuclear bromine by chlorine in aromatic bromo compounds which comprises heating the aromatic bromo compound with at least one equivalent of cuprous chloride in the presence of a nitrogen-containing cuprous ion complexing agent to a temperature of at least 75° C. and recovering the aromatic chloro compound so obtained.

---

2,769,816



## TRIFLUOROMETHYL DIPHENYLAMINE DYES

Nicholas J. Karlson, Nazareth, and Albert C. Starke, Jr., Easton, Pa.

No Drawing. Application October 24, 1950, Serial No. 191,916

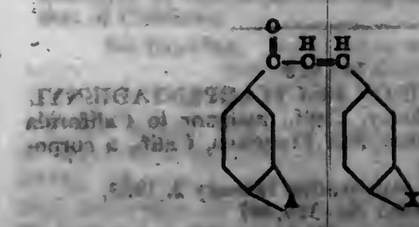
6 Claims. (Cl. 260—340.3)

1. A compound having the formula:

wherein B represents a benzene ring containing 1–2 nuclear substituent chains of interconnected methylene groups and oxygen atoms containing up to five carbon atoms and not more than one hydroxyl group, of the class consisting of hydroxy-mono- and -polyethenoxy groups, hydroxy-mono- and -polyethenoxy methyl groups, and a fused, otherwise unsubstituted 1,3-dioxane ring.

---

2,769,817



## THERAPEUTIC SUBSTITUTED CHALCONES

Gustav J. Martin and Jay Morton Beiler, Philadelphia, and Souren Avakian, Oreland, Pa., assignors to The National Drug Company, Philadelphia, Pa., a corporation of Delaware

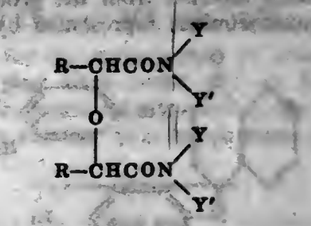
No Drawing. Application June 7, 1951, Serial No. 230,438

5 Claims. (Cl. 260—340.5)

1. A therapeutic chalcone having the formula

in which A represents substitution of the class consisting of two hydroxyl groups, two methoxy groups and one methylene dioxy group, X represents substitution of the class consisting of two hydrogen groups, two hydroxyl groups, two methoxy groups and one methylene dioxy group, and at least one of the substituents A and X is two hydroxyl groups.

2,769,818



## OXYBIS (PHENYLACETAMIDES)

Arthur H. Schlesinger, Dayton, Ohio, assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application December 7, 1954, Serial No. 473,723

12 Claims. (Cl. 260—347.3)

1. An amido ether having the formula

in which R is selected from the class consisting of the phenyl group and a phenyl group having from 1 to 2 substituents selected from the class consisting of alkyl radicals of from 1 to 5 carbon atoms, the nitro radical, and chlorine, Y taken separately represents a substituent selected from the class consisting of hydrocarbon radicals of from 1 to 12 carbon atoms, alkoxyalkyl radicals of from 2 to 12 carbon atoms, dialkylaminoalkyl radicals of from 4 to 12 carbon atoms, and the furfuryl radical, Y′ taken separately is selected from the class consisting of hydrogen and Y, and Y and Y′ taken together with N form a heterocyclic ring structure of from 4 to 5 carbon atoms which ring structure is attached through said N to the remainder of the molecule of which it forms a part.

---

2,769,819

## ALKYLENE-DIAZIDES

Armiger H. Sommers and James D. Barnes, Waukegan, Ill., assignors to Abbott Laboratories, North Chicago, Ill., a corporation of Illinois

No Drawing. Application February 9, 1955, Serial No. 487,220

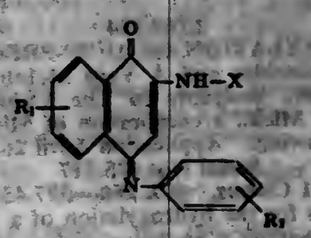
8 Claims. (Cl. 260—349)

1. An azide having the formula

where $n$ is 5–10 inclusive.

---

2,769,820



## CERTAIN NEW 1,4-NAPHTHOQUINONEIMINES AND METHODS OF PREPARING THE SAME

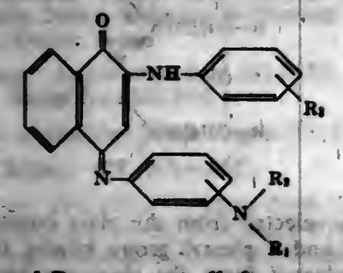
Jackson P. English, Stamford, and Richard C. Clapp, Old Greenwich, Conn., assignors to American Cyanamid Company, New York, N. Y., a corporation of Maine

No Drawing. Application May 21, 1953, Serial No. 356,685

14 Claims. (Cl. 260—396)

1. Compounds selected from the group consisting of 1,4-naphthoquononeimines represented by the formula:

wherein $R_1$ represents hydrogen and $R_2$ represents at least one member selected from the group consisting of lower alkyl radicals, and lower dialkylamino radicals, and X represents a cyclohexyl nucleus; and acid addition salts thereof.



2,769,821

## 1,4-NAPHTHOQUINONEIMINE COMPOUNDS AND METHODS OF PREPARING THE SAME

Joe H. Clark, Darien, and Jackson P. English, Stamford, Conn., assignors to American Cyanamid Company, New York, N. Y., a corporation of Maine

No Drawing. Application May 21, 1953, Serial No. 356,588
9 Claims. (Cl. 260—396)

1. Compounds selected from the group consisting of 1,4-naphthoquinoneimines represented by the formula:

wherein $R_1$ and $R_2$ represent alkyl groups and $R_3$ represents a member selected from the group consisting of alkyl and dihydroxyalkylamino radicals; and acid addition salts thereof.

2,769,822

## PREPARING $\Delta^4$-3-KETO-ETIENIC ACIDS

Virgil W. Gash, Dayton, Ohio, assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application May 26, 1954, Serial No. 432,591
8 Claims. (Cl. 260—397.1)

1. A method of preparing a $\Delta^4$-3-keto-etienic acid which comprises reacting a steroid selected from the group consisting of $\Delta^4$-pregnene-3,20-dione compounds and $\Delta^4$-pregnene-3-one-20-ol compounds with a hypohalite selected from the group consisting of hypobromites and hypoiodities resulting in degradation of the $C_{17}$ side chain to form the corresponding $\Delta^4$-3-keto-etienic acid.

2,769,823

## PREPARATION OF 17α-HYDROXY-20-KETO-PREGNENES

William P. Schneider, Kalamazoo, and Arthur R. Hanze, Kalamazoo Township, Kalamazoo County, Mich., assignors to The Upjohn Company, Kalamazoo, Mich., a corporation of Michigan

No Drawing. Application April 23, 1954, Serial No. 425,315
20 Claims. (Cl. 260—397.45)

1. A process for the production of a 17-hydroxy-20-keto-21-acyloxy steroid of the pregnane series which comprises oxygenating a $\Delta^{17(20)}$-21-acyloxy steroid of the pregnane series having a 20-hydrogen atom with osmium tetroxide and a tertiary amine oxide peroxide to produce the corresponding 17-hydroxy-20-keto-21-acyloxy steroid.

2,769,824

## HYDROXYLATION OF $\Delta^{17(20)}$-PREGNENES

William P. Schneider and A Vern McIntosh, Jr., Kalamazoo, Mich., assignors to The Upjohn Company, Kalamazoo, Mich., a corporation of Michigan

No Drawing. Application April 26, 1954, Serial No. 425,717
11 Claims. (Cl. 260—397.45)

1. A process for the hydroxylation of a 3-oxygynated-$\Delta^{17(20)}$-steroid having a pregnane carbon skeleton which comprises reacting the steroid with at least one equivalent each of water and a tertiary predominantly non-aromatic amine oxide and less than a molar equivalent of osmium tetroxide to produce the corresponding 17α,20-dihydroxy steroid.

2,769,825

## PREPARATION OF 17α-HYDROXY-20-KETO-PREGNENES FROM $\Delta^{16}$-PREGNENES

William P. Schneider, Kalamazoo, and John A. Hogg, Kalamazoo Township, Kalamazoo County, Mich., assignors to The Upjohn Company, Kalamazoo, Mich., a corporation of Michigan

No Drawing. Application April 26, 1954, Serial No. 425,718
13 Claims. (Cl. 260—397.45)

1. A process for the production of a 17α-hydroxy-20-keto-21-acyloxy steroid which comprises: oxygenating a 3-oxygenated-$\Delta^{17(20)}$-21-acyloxy steroid having a pregnane carbon skeleton and wherein the acyl radical is that of an organic carboxylic acid of from one to eight carbon atoms, inclusive, with osmium tetroxide and hydrogen peroxide in the presence of an aromatic tertiary-N-heterocyclic amine.

2,769,826

## ISOCYANATE-CASTOR OIL METAL CEMENT

Clayton W. Yohe, Pittsburgh, Pa., assignor to Stoner-Mudge, Inc., Pittsburgh, Pa., a corporation of Pennsylvania

No Drawing. Application September 28, 1953, Serial No. 382,573
4 Claims. (Cl. 260—407)

1. A process of preparing a polymeric cement of suitable viscosity, comprising the steps of preparing a first prepolymer in which the reactants consist of 5.5 to 11 parts of methylene bis-(4-phenyl isocyanate) and 72 parts of castor oil, and a second prepolymer in which the reactants consist of 10 to 28 parts of methylene bis-(4-phenyl isocyanate) and 10 parts of castor oil, said prepolymers each having a stable viscosity in the range of 5000 to 100,000 centipoises at 80° F., and subsequently mixing the said prepolymers in such proportions that the total mixture has a methylene bis-(4-phenyl isocyanate) and castor oil content in substantially stoichiometric proportions.

2,769,827

## PURIFICATION OF GLYCERIDE OILS

Benjamin Clayton, Houston, Tex.

Application May 1, 1951, Serial No. 223,956
6 Claims. (Cl. 260—425)

1. The process of purification of crude glyceride oils containing gums and free fatty acids, which comprises, admixing with said oil an amount of aqueous ammonia ranging between 1 and 3.5% by weight of the oil and having a concentration between 1.5 and 29%, continuously centrifugally separating the resulting mixture at a temperature between 140 and 175° F. into an aqueous effluent containing gums having a reduced content of glyceride oil and an oil effluent substantially free from gums, diluting said aqueous effluent with an amount of water ranging from 1 to 3 times the weight of said aqueous effluent, and vaporizing water and ammonia from the diluted effluent to provide a product substantially free of ammonia.

2,769,828

## PRODUCTION OF IRON BISCYCLOPENTADIENYL

Robert P. Sieg, Berkeley, Calif., assignor to California Research Corporation, San Francisco, Calif., a corporation of Delaware

No Drawing. Application January 2, 1953, Serial No. 329,467
12 Claims. (Cl. 260—439)

1. A cyclic process for the production of iron biscyclopentadienyl which comprises reacting a cyclopentadiene with an iron reactant possessing a surface of elemental iron at a temperature in the range of 400 to 800° F., contacting the reaction spent iron reactant with an oxidizing gas selected from the group consisting of steam and carbon dioxide at a temperature in the range of 600 to 1600° F. to produce a surface of equilibrium iron oxide on said iron reactant, reducing the resulting oxidized iron reactant with a reducing agent to produce a reactive surface of elemental iron and thereafter contacting the resulting reactive elemental iron reactant with the cyclopentadiene charge.

2,769,829

## PROCESS FOR PREPARING OCTAETHYLCYCLOTETRASILOXANE

Donald G. Debay, Brecksville, Ohio, assignor to Union Carbide and Carbon Corporation, a corporation of New York

No Drawing. Application December 29, 1953, Serial No. 401,852
8 Claims. (Cl. 260—448.2)

1. An improved process of preparing octaethylcyclotetrasiloxane by the hydrolysis of diethyldichlorosilane which comprises mixing diethyldichlorosilane, substantially free of other hydrolyzable silanes, with water and an aliphatic alcohol as the hydrolysis medium, said aliphatic alcohol being completely water soluble and containing only hydrogen, oxygen and carbon atoms and having only a single hydroxyl group therein, said alcohol being present in said medium in an amount by volume of from about 3 parts of alcohol to about 6 parts of alcohol per part of water.

2,769,830

## PROCESS FOR PREPARING HEXAETHYLCYCLOTRISILOXANE

Donald G. Debay, Brecksville, Ohio, assignor to Union Carbide and Carbon Corporation, a corporation of New York

No Drawing. Application December 29, 1953, Serial No. 401,851
6 Claims. (Cl. 260—448.2)

1. An improved process for preparing hexaethylcyclotrisiloxane by the hydrolysis of diethyldichlorosilane which comprises mixing diethyldichlorosilane, substantially free of other hydrolyzable silanes, with water and an aliphatic alcohol as the hydrolysis medium, said aliphatic alcohol being completely water soluble and containing only hydrogen, oxygen and carbon atoms and having only a single hydroxyl group therein, said water being present in said medium in an amount by volume of from about 3 parts of water to about 9 parts of water per part of alcohol.

2,769,831

## PREPARATION OF UNSYMMETRICAL TRIALKYL-TETRATHIO-ORTHO-PHOSPHATES

Carleton B. Scott, Pomona, Calif., assignor to Union Oil Company of California, Los Angeles, Calif., a corporation of California

No Drawing. Application May 2, 1955, Serial No. 505,544
11 Claims. (Cl. 260—461)

3. The process which comprises heating a mixture of an alkyl-trithio-metaphosphate of the general formula RSPS$_2$, wherein R represents an alkyl group, and an alkyl mercaptan of the general formula R'SH, wherein R' represents an alkyl group different from R, at a reaction temperature to form a dialkyl-tetrathio-ortho-phosphate of the general formula (RS)(R'S)P(S)SH; and thereafter heating a mixture of said dialkyl-tetrathio-ortho-phosphate and an olefine at a reaction temperature to form a trialkyl-tetrathio-ortho-phosphate of the general formula (RS)(R'S)(R''S)PS, wherein R'' represents the alkyl group corresponding to said olefine.

2,769,832

## MANUFACTURE OF AROMATIC NITRILES

Edward L. Kelly, Woodbury, N. J., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application February 26, 1954, Serial No. 412,957
7 Claims. (Cl. 260—465)

1. A process for the manufacture of aromatic nitriles comprising bringing nitric oxide and an N-methyl-substituted aromatic amine into contact in the presence of a silver-on-silica catalyst at a temperature of from 450 to 550° C.

2,769,833

## PRODUCTION OF PHENOXY ACID ESTERS THROUGH THE POTASSIUM PHENOLATE

Ira Weil, New York, N. Y., assignor to Diamond Alkali Company, Cleveland, Ohio, a corporation of Delaware

No Drawing. Application November 2, 1953, Serial No. 389,893
10 Claims. (Cl. 260—473)

1. A process for the production of phenoxy acid esters which comprises reacting a phenol with substantially anhydrous potassium hydroxide thereby producing potassium phenolate, removing the water product of reaction, condensing with said phenolate under substantially anhydrous conditions, an ester having a functional group reactive with the potassium of the said phenolate, said group being attached to a carbon atom of the acid portion of said ester, and recovering the phenoxy acid ester so formed as the product of the reaction.

2,769,834

## ADDUCTS OF MONOALKENYLSUCCINATES WITH FUMARATES

Joachim Dazzi, Dayton, Ohio, assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application March 12, 1953, Serial No. 342,031
4 Claims. (Cl. 260—485)

1. An addition product in which there is combined 1 mole of a dialkyl monoalkenylsuccinate in which the alkyl radical has from 1 to 6 carbon atoms and the alkenyl radical has from 5 to 18 carbon atoms with 1 mole of a dialkyl fumarate of from 6 to 16 carbon atoms.

2,769,835

## PROCESS OF PRODUCING ALKYL ACRYLATES BY DEHYDROHALOGENATION USING AN ANHYDROUS CALCIUM SULFATE CATALYST

Milton Kosmin and Samuel Allen Heininger, Dayton, Ohio, assignors to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application December 9, 1953, Serial No. 397,258
6 Claims. (Cl. 260—486)

1. The method which comprises contacting an alkyl β-chloropropionate having from 1 to 18 carbon atoms in the alkyl radical with anhydrous calcium sulfate at a temperature of from 150° C. to 375° C. and recovering from the resulting reaction product an alkyl acrylate having from 1 to 18 carbon atoms in the alkyl radical.

2,769,836
**PROCESS FOR PREPARING OIL-SOLUBLE SULFONIC ACIDS**
Everett E. Gilbert, Flushing, and Benjamin Veliković, Albertson, N. Y., assignors to Allied Chemical & Dye Corporation, New York, N. Y., a corporation of New York
No Drawing. Application March 18, 1953, Serial No. 343,228
9 Claims. (Cl. 260—504)

1. A process for preparing oil-soluble sulfonic acids which comprises contacting with sulfur trioxide gas, in a single step, at temperatures between about 10° C. and about 70° C., an aromatic petroleum extract having a Saybolt Universal viscosity at 210° F. of at least about 100 seconds, in the presence of at least about 25% by weight of an inert liquid selected from the group consisting of chloroalkanes, chlorofluoroalkanes, chlorinated mononuclear and binuclear aromatic hydrocarbons, and nitromononuclear aromatic hydrocarbons whereby a sulfonation product free from troublesome sludge is obtained.

2,769,837
**3,5-DIISOPROPYLSALICYLAMIDE**
Melville Sahyun and John A. Faust, Santa Barbara, Calif., assignors to Sahyun Laboratories, Santa Barbara, Calif., a corporation of California
No Drawing. Application December 8, 1952, Serial No. 324,832
1 Claim. (Cl. 260—559)

3,5-diisopropylsalicylamide.

2,769,838
**POLYGLYCOL ETHER ACID ANILIDES**
Max Matter, Werk, near Bern, Alberto Rossi, Bern, and Hans von Sprecher, Basel, Switzerland, assignors to Ciba Pharmaceutical Products, Inc., Summit, N. J.
No Drawing. Application November 16, 1954, Serial No. 469,296
Claims priority, application Switzerland November 20, 1953
4 Claims. (Cl. 260—562)

4. Poly-1:2-glycol ethers of the formula:

$$R-(OCH_2CH_2)_n-O-CH_2-CO-N-Z$$
$$\qquad\qquad\qquad\qquad\qquad\qquad\quad |$$
$$\qquad\qquad\qquad\qquad\qquad\qquad\quad Y$$

wherein $n$ represents a whole number from 2 to 20 inclusive, R represents a member selected from the group consisting of hydrogen and alkyl radicals containing at most 7 carbon atoms, Y represents a member of the group consisting of hydrogen and an alkyl radical containing at most 7 carbon atoms, and Z represents a member selected from the group consisting of 2,6-dimethylphenyl and 2,6-dimethyl-4-lower-alkoxyphenyl radicals.

2,769,839
**PREPARATION OF MERCAPTO AMINES**
John K. Fiscke, Dayton, Ohio, assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware
No Drawing. Application June 23, 1950, Serial No. 170,039
5 Claims. (Cl. 260—570.5)

1. The process of preparing compounds having the general formula

$$R-S-\underset{\displaystyle Z}{\underset{|}{C}}HCHNH_2$$

in which R is a member of the group consisting of alkyl, aryl, aralkyl and alicyclic radicals of from 1 to 18 carbon atoms, and Z is a member of the group consisting of hydrogen and the methyl radical which comprises treating with ammonia, mercapto halides having the general formula

$$R-S-\underset{\displaystyle Z}{\underset{|}{C}}HCHX$$

in which R is a member of the group consisting of alkyl, aryl, aralkyl and alicyclic radicals of from 1 to 18 carbon atoms, Z is a member of the group consisting of hydrogen and the methyl radical and X is a member of the group consisting of chlorine and bromine at superatmospheric pressure of up to 4000 pounds per square inch and at temperatures of from 60° C. to 150° C.

2,769,840
**COMPLEXES OF HIGHER ALKANOL AMINES AND BORON TRIFLUORIDE**
Frank J. Sowa, Cranford, N. J.
No Drawing. Application December 29, 1951, Serial No. 264,279
18 Claims. (Cl. 260—584)

1. A compound having the composition indicated by the formula

$$\left(\begin{array}{l} R^1 \\ R^2\!-\!N \\ R^3 \end{array}\right)_n \cdot BF_3$$

wherein $R^1$ is a monohydroxy alkyl radical containing at least two carbon atoms, $R^2$ is selected from the alkyl and alkenyl radicals having from 10 to 18 carbon atoms in a straight chain with a terminal carbon atom of the chain connected to the nitrogen atom of the amine, $R^3$ is selected from the group consisting of hydrogen, monohydroxy alkyl radicals containing at least two carbon atoms and alkyl radicals, and $n$ is a whole number from 1 to 3.

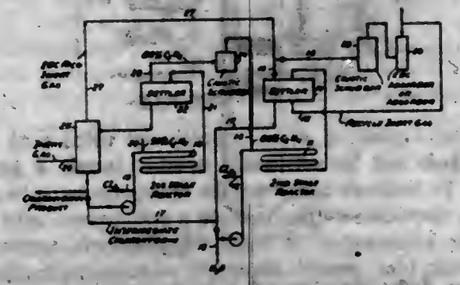
2,769,841
**PRODUCTION OF ETHYLENE POLYAMINES**
Stanley W. Dylewski, Harvey G. Dubois, and Glenn W. Warren, Midland, Mich., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Delaware
No Drawing. Application December 23, 1953, Serial No. 400,102
5 Claims. (Cl. 260—585)

1. In a process for making an ethylene polyamine wherein a liquid mixture of ethylene dichloride and an aqueous solution of ammonia is reacted by heating the same to a reaction temperature under pressure, the step which consists in feeding to the reaction at least 0.05 mole of diethylenetriamine per mole of the ethylene dichloride starting material.

2,769,842
**PREPARATION OF DYPNONE**
Alfred R. Bader, Milwaukee, Wis., assignor to Pittsburgh Plate Glass Company, Allegheny County, Pa., a corporation of Pennsylvania
No Drawing. Application September 21, 1953, Serial No. 381,510
4 Claims. (Cl. 260—590)

1. The method which comprises bringing together acetophenone and polyphosphoric acid, thereby to obtain dypnone.

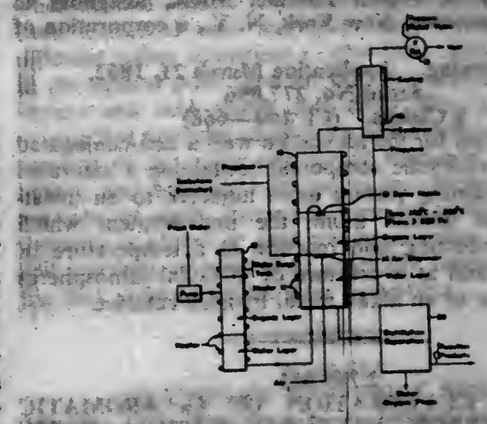
2,769,843
**TRICYCLODECANE-(5,2,1,$0^{2,6}$)-TRIOL-(3,4(8—9))**
Hans Feichtinger, Duisburg-Hoerk, Germany, assignor to Ruhrchemie Aktiengesellschaft, Oberhausen-Holten, Germany, a corporation of Germany
No Drawing. Application December 30, 1953, Serial No. 401,423
Claims priority, application Germany January 17, 1953
9 Claims. (Cl. 260—617)



1. As a new chemical compound tricyclodecane-(5,2,1,$0^{2,6}$)-triol-(3,4,(8—9)).

2,769,844
**PROCESS FOR PREPARATION OF PARA-ALPHA-CUMYL PHENOL**
George G. Joris, Madison, N. J., assignor to Allied Chemical & Dye Corporation, New York, N. Y., a corporation of New York
No Drawing. Application June 5, 1952, Serial No. 291,979
1 Claim. (Cl. 260—619)

Process for production of para-alpha-alpha-dimethyl benzyl phenol which comprises forming a liquid reaction mixture by introducing gradually, into a phenol-containing reaction zone, dimethyl phenyl carbinol and cumene hydroperoxide, said starting materials being diluted by not more than about 9-fold their weight of cumene, with cumene hydroperoxide therein being in about 1:1 mol ratio with dimethyl phenyl carbinol therein; maintaining in said reaction mixture mol ratios of input cumene hydroperoxide together with phenol present in the reaction zone:input dimethyl phenyl carbinol in the range between about 2:1 and about 3:1, employing as catalyst sulfuric acid dissolved in the reaction mixtures in amounts above about 0.01% and below about 2% by weight; maintaining temperatures in the range between about 120° C. and about 150° C.; and recovering para-alpha, alpha-dimethyl benzyl phenol.



2,769,845
**PRODUCTION OF OLEFIN CHLOROHYDRINS**
Rudolph Kunz, Niagara Falls, N. Y., assignor to Olin Mathieson Chemical Corporation, a corporation of Virginia
Application April 16, 1953, Serial No. 349,177
4 Claims. (Cl. 260—634)

1. In the production of olefin chlorohydrins by chlorohydrination of an olefin rich gas with dilute aqueous hypochlorous acid formed from the reaction of chlorine and water, the method which comprises conducting the chlorohydrination reaction in a plurality of serially connected gas-liquid reaction stages wherein the olefin rich gas and liquid flow countercurrently between the stages, separating gas and reaction liquor between stages and scrubbing the reaction liquor with an inert gas stream to remove ethylene dichloride.

2,769,846
**PRODUCTION OF CHEMICALS**
Albert Di Nardo, Jamaica Plain, and James H. Gardner and Nat C. Robertson, Cambridge, Mass., assignors to National Research Corporation, Cambridge, Mass., a corporation of Massachusetts
Application May 4, 1953, Serial No. 352,696
4 Claims. (Cl. 260—635)

1. A method of producing oxygenated hydrocarbons which comprises the steps of passing an elemental-oxygen-containing gas upwardly through a liquid hydrocarbon which can be oxidized to water-soluble oxygenated products, maintaining said liquid hydrocarbon under pressure and at a temperature above about 140° C. while said gas passes therethrough to oxidize said liquid hydrocarbon to primary oxidation products, passing water droplets downwardly through the major portion of said liquid hydrocarbon to extract the water-soluble oxidation products therefrom, and collecting the water-soluble oxidation products as an aqueous phase below the point of introduction of the elemental-oxygen-containing gas.

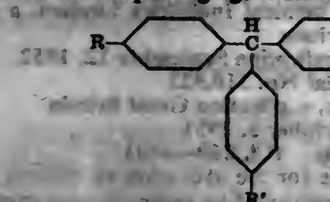
2,769,847
**CATALYSTS FOR THE HYDRATION OF OLEFINES AND DEHYDRATION OF ALCOHOLS**
Ralph Leslie Robinson, Norton-on-Tees, England, assignor to Imperial Chemical Industries Limited, a corporation of Great Britain
No Drawing. Application September 22, 1952, Serial No. 310,923
Claims priority, application Great Britain October 3, 1951
9 Claims. (Cl. 260—641)

1. A catalyst suitable for the hydration of olefines, the catalyst consisting essentially of an intimate admixture of titania and ferric oxide, the proportion of ferric oxide being between 1 and 90 moles per 100 moles of admixture.

2,769,848
**SYNTHESIS OF 3,3-DIMETHYL-1,5-DICHLOROPENTANE**
Arthur William Anderson, Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application December 10, 1954, Serial No. 474,599
3 Claims. (Cl. 260—658)

2. A process for preparing 3,3-dimethyl-1,5-dichloropentane which comprises reacting ethylene with 2,2-dichloropropane in the presence of anhydrous aluminum chloride at a temperature within the range of —40° C. to +10° C. at a pressure of from 1 to 800 pounds per square inch whereby 3,3-dimethyl-1,5-dichloropentane is produced and thereafter separating the said 3,3-dimethyl-1,5-dichloropentane from the resulting mixture.

2,769,849
**PRODUCTION OF ALKYLCYCLOPARAFFINS**
Louis Schmerling, Riverside, Ill., assignor to Universal Oil Products Company, Chicago, Ill., a corporation of Delaware
No Drawing. Application October 26, 1950, Serial No. 192,370
8 Claims. (Cl. 260—666)

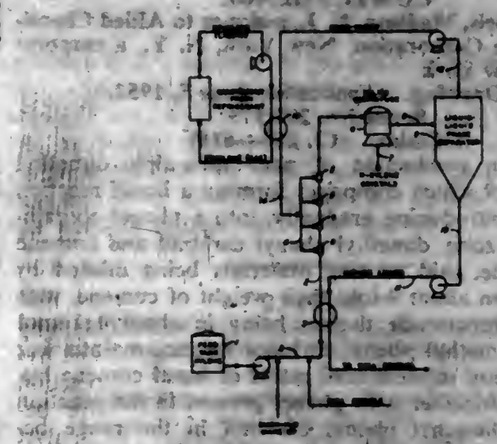


1. A process for producing alkylcycloparaffins which comprises forming a mixture consisting of ethylene, a cycloparaffin and an organic peroxide catalyst, reacting the ethylene with the cycloparaffin by heating said mixture at a pressure above about 15 atmospheres to a temperature at least as high as the initial decomposition temperature of said catalyst, and recovering the resultant ethylene-cycloparaffin reaction product.

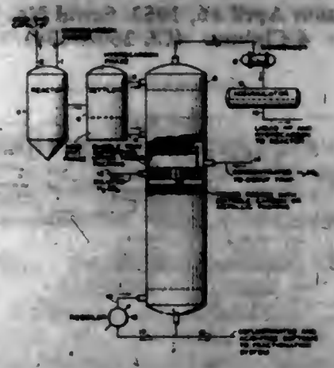
2,769,850
ALKYLATION REACTIONS
Rex D. Closson, Detroit, Alfred J. Kolka, Birmingham, and Waldo E. Ligett, Pontiac, Mich., assignors to Ethyl Corporation, New York, N. Y., a corporation of Delaware
No Drawing. Application March 21, 1952, Serial No. 277,896
8 Claims. (Cl. 260—668)

1. In a process for the alkylation with a non-conjugated olefin of a carbocyclic compound containing a saturated hydrogen-containing carbon atom adjacent to an unsaturated nuclear carbon atom, the improvement which comprises conducting said reaction at a temperature of 200–375° C. and at a pressure of 20–3000 atmospheres in the presence of an alkali metal hydride catalyst.

2,769,851
SELECTIVE CLATHRATION OF $C_8$ AROMATIC HYDROCARBON MIXTURES WITH A PARA-AMINO SUBSTITUTED TRIPHENYLMETHANE
William D. Schaeffer, Berkeley, Calif., assignor to Union Oil Company of California, Los Angeles, Calif., a corporation of California
No Drawing. Application February 18, 1955, Serial No. 489,276
7 Claims. (Cl. 260—674)



1. A process for resolving a mixture of C–8 aromatic hydrocarbons which comprises contacting said mixture with a solid complexing agent having the general formula:

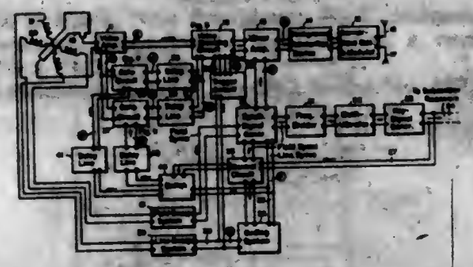


wherein R and R' are selected from the group consisting of —H, —$NH_2$ and —OH, whereby one hydrocarbon in said mixture is selectively absorbed in preference to another, separating a solid complex from said contacting step, and recovering a raffinate hydrocarbon phase relatively enriched in the less readily absorbable components of said mixture.

2,769,852
SEPARATION OF XYLENE ISOMERS BY FRACTIONAL CRYSTALLIZATION
Marvin H. Paulson, El Cerrito, Calif., assignor to California Research Corporation, San Francisco, Calif., a corporation of Delaware
Application April 1, 1953, Serial No. 346,159
6 Claims. (Cl. 260—674)

1. In a process for recovering xylenes from hydrocarbon liquids containing xylenes by fractional crystallization, the improved method which comprises cooling a mixture of methanol and water, containing 2 to 6 parts of water to 10 parts of methanol to a temperature below —100° F. by indirect heat exchange in a cooling zone, directly contacting sufficient cooled methanol-water mixture with said hydrocarbon liquid in a crystallization zone to cause formation of solid xylene crystals, separating a solid xylene phase from a mother liquor phase, settling the mother liquor phase to separate a hydrocarbon phase and a methanol-water phase, and returning the methanol-water phase to the cooling zone.

2,769,853
CATALYTIC DEFLUORINATION PROCESS
George Riley Hattick, Borger, Tex., assignor to Phillips Petroleum Company, a corporation of Delaware
Application September 21, 1951, Serial No. 247,735
12 Claims. (Cl. 260—653.4)



1. In the defluorination of organic materials containing combined fluorine and hydrocarbons which comprises contacting said materials with a solid defluorinating catalyst selected from the group consisting of bauxite, carbon, and metallic packing at a temperature in the range of 150 to 300° F., and at a pressure in the range of atmospheric to 500 p. s. i., the improvement which comprises introducing to said catalyst, hydrogen fluoride resulting from a hydrocarbon conversion operation in which said hydrogen fluoride has been used as a hydrocarbon conversion catalyst and as a result of which use said hydrogen fluoride now contains hydrogen fluoride soluble oils and water as the sole step of separating hydrogen fluoride from hydrogen fluoride-soluble oils.

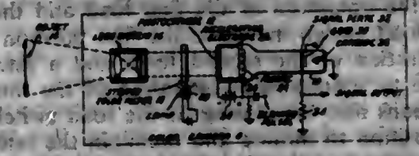
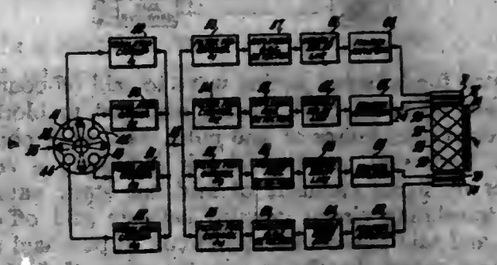
2,769,854
SUBSCRIPTION TELEVISION SYSTEM
Jack E. Bridges, Chicago, Ill., assignor to Zenith Radio Corporation, a corporation of Illinois
Application December 8, 1951, Serial No. 260,641
5 Claims. (Cl. 178—5.1)



1. A subscription television transmitter comprising: a source of video signals representing image intelligence during recurrent line-trace intervals; a source of synchronizing signals during recurrent retrace intervals interposed between said trace intervals; coding means coupled to at least one of said sources for altering the time relation between said video and synchronizing signals in accordance with a predetermined coding schedule; a mixer circuit, coupled to said sources, for producing a television signal including said video and synchronizing signals; a blanking circuit responsive to an applied signal for suppressing said video signals; means, comprising means for supplying a signal to said blanking circuit during a selected portion of each of said line-trace intervals to effect actuation of said blanking circuit, for equalizing the video content represented by said video signals during said line-trace intervals irrespective of the time relation between said video and synchronizing signals; means for establishing said television signal at a predetermined signal level during said selected portion

of each of said line-trace intervals; at least one sampling circuit for selecting a portion of said video signals during each of said line-trace intervals; and means, comprising means coupled between said sampling circuit and said signal level establishing means, for superimposing said selected portions of said video signals on said signal level.

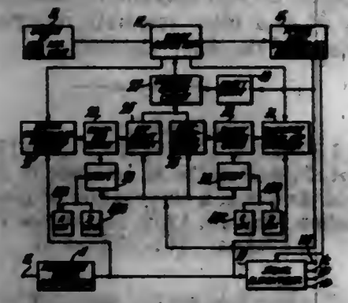


2,769,855
COLOR TELEVISION CAMERA TUBE WITH INDEXING STRUCTURE
Wilson P. Boodeyd, Huntingdon Valley, Abington Township, and Edgar M. Creamer, Jr., Philadelphia, Pa., assignors to Philco Corporation, Philadelphia, Pa., a corporation of Pennsylvania
Application December 29, 1950, Serial No. 203,248
6 Claims. (Cl. 178—5.4)

1. In a color television camera, a camera tube for producing a signal voltage indicative of the magnitudes of the color components of the color content of an object, said tube comprising a photosensitive electrode system and an output electrode arranged in cooperative relationship to said photosensitive electrode system, said photosensitive electrode system including an image surface to be scanned in successive line scannings, each line section of said surface comprising successive elemental areas each including a plurality of first portions and at least one second portion, means for directing light from said object onto said photosensitive electrode system, means for rendering each of said first portions responsive to light of a different color derived from said object than the other first portions to cause such portions to assume respectively charges of different intensities not exceeding a predetermined maximum value of intensity, said color responsive portions occuring in the same sequence in the successive elemental areas, means for causing said second portion of each elemental area to assume a charge of intensity in excess of said maximum value independently of light derived from said object, the second portions occupying the same position in each elemental area, scanning means for analyzing the charge intensities of the successive elemental areas in each line section of said surface, and means comprising said output electrode for deriving from the analyzed consecutive elemental areas a signal having a recurring time-spaced first components and having time-spaced second components occurring between said first components, said first components having amplitude values not exceeding a given maximum value and determined by the charge intensities of said first portions of said elemental areas, and said second components having an amplitude greater than the amplitude values of said first components and determined by the charge intensity of said second portions of said elemental areas.

3. A color television camera according to claim 1, wherein said means for rendering said first portions of each elemental area responsive respectively to light of different colors compriaes a color filter assembly arranged in the optical path between said photosensitive electrode system and said object, said color filter assembly comprising first portions adapted to derive different color components of the color content of elemental areas of said object, and wherein said means for causing said second portions of each elemental area to assume charges of intensity in excess of said maximum value comprises second portions of said filter assembly interposed between the first portions of the filter assembly.

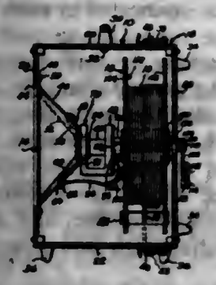
2,769,856
MULTIPLEX FACSIMILE SYSTEM
Maurice Artzt, Princeton, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application May 13, 1950, Serial No. 161,887
4 Claims. (Cl. 178—6.6)



1. A multiplex facsimile system comprising a scanner having a copy holder and a plurality of spaced facsimile signal pick-up devices cooperating with said copy holder, a plurality of modulators, one for each signal pick-up device, the output of each modulator being a modulated carrier for transmission over a channel of a communication medium, each modulated carrier having a different frequency, intercoupling means to combine the outputs of said modulators for transmission over a single communication link, a filter for each channel, each filter selecting a signal modulated carrier, an amplifier connected to each filter, a detector connected to each channel amplifier, a variable delay line connected to each detector to compensate for mismatching in said system resulting from different delays in the several channels, a printer amplifier connected to each variable delay line, a recorder having a separate recording element for each channel, said elements being spaced in accordance with the spacing of said pick-up devices, means for connecting each element to its respective printer amplifier, and a common recording element cooperating with said separate recording elements.

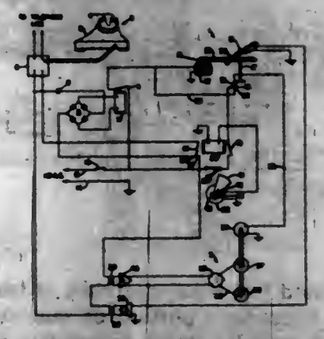
2,769,857
AUTOMATIC PHASING OF SYNCHRONOUS MULTIPLEX TELEGRAPH SYSTEMS
Anthony Lignori, Hackensack, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application February 1, 1954, Serial No. 407,198
20 Claims. (Cl. 178—50)

1. An electronic circuit arrangement for automatically phasing a received polystatic aggregate signal wave, comprising individual signal elements expressing a plurality of intelligence characters wherein each character is constituted by a predetermined number of signal elements and there is a prearranged ratio of signal elements of at least one static nature to the number of signal elements of the character as a whole and wherein said ratio of at least one of said characters is different than said ratio of the other characters, with a fundamental timing wave locally generated in a system of the type including a phase ad-



justing circuit to which a standard frequency wave is applied and from which said locally generated wave is obtained, including a signal repeating circuit to which said aggregate signal is applied to assign the signal elements of each character into an individual channel, a counting circuit coupled to said repeating circuit to count the signal elements of one static nature of the character assigned to the counting circuit under consideration and to produce an output indicating the count, an off-count circuit coupled to said counting circuit, means to apply a phase correcting pulse wave harmonically related to said locally

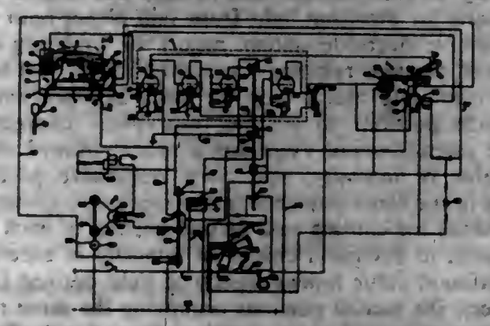
generated fundamental timing wave to said off-count circuit, said off-count circuit being arranged to block the phase correcting pulses of said pulse wave in response to output from said counting circuit indicating a correct number of signal elements of said one static nature, a pulse translating circuit coupled between said off-count circuit and said phase adjusting circuit to pass said phase correcting pulses, thereby to vary the phase of the locally generated timing wave with respect to the standard frequency wave and into a predetermined phase relationship with said received wave.



---

2,769,858
PORTABLE REAR SEAT SPEAKER
Alvin H. Stoffen, Detroit, Mich.
Application March 29, 1955, Serial No. 497,657
4 Claims. (Cl. 179—1)

1. A portable rear seat speaker for use in automobiles comprising a housing, means on said housing adapted to releaseably mount said housing on a portion of an automobile at the rear of a seat, a generally conical speaker, electric motor means operable to drive said speaker, support means mounting said motor means generally coaxially with and in operative relation to said speaker, a reel, bearing means on said support means and said housing rotatably supporting said reel, an electrical conductor wound on said reel, means electrically connecting one end of said conductor to said motor means, the other end of said conductor extending outwardly of said housing and being adapted to be connected to an amplifier of the type used in automobile radio receivers, and means operable to turn said reel for paying out said conductor and reeling said conductor in so that said speaker can be operated inside or outside of an automobile with which it is adapted to be used.

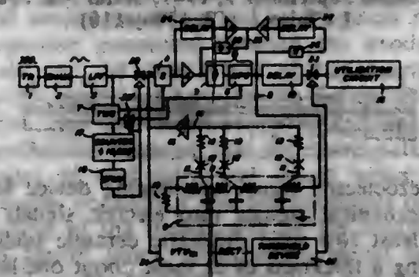


2,769,859
POWER SUPPLY SWITCHING CIRCUIT
Joseph J. Zimmermann, Milwaukee, Wis., assignor to The Electronic Secretary, Inc., Milwaukee, Wis., a corporation of Wisconsin
Application October 22, 1954, Serial No. 463,850
7 Claims. (Cl. 179—6)

1. In a power supply circuit for sequentially supplying power to a first load and a second load, an intermittent switch means connected in series with the first load and a source of power to periodically energize the first load, a load switch means having a first position connected to the second load and a second position connected to the first load to supply power to the respective loads, a latch switch connected between the load switch means and the source of power to maintain the load switch normally disconnected from the source of power, means responsive to the operation of the first load to move the load switch means from said first position to said second position and maintain the load switch in the second position for the duration of the first load operation, timing means to discontinue the operation of the first load and thereby return the load switch means to the first position to effect an energization of the second load, and a latch means responsive to simultaneous operation of the intermittent switch means and the closing of the load switch to said second position to initiate and maintain the latch switch in an actuated position to effect the connection of the load switch to the source of power.

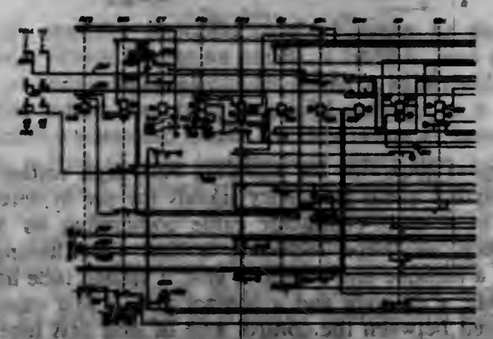
---

2,769,860
TIMING AND HOLDING APPARATUS
Joseph J. Zimmermann, Milwaukee, Wis., assignor to The Electronic Secretary, Inc., Milwaukee, Wis., a corporation of Wisconsin
Application October 22, 1954, Serial No. 463,977
10 Claims. (Cl. 179—6)



1. In a timing and holding control apparatus, a driven member, means biasing said driven member to an initial position, an alternating current motor, a source of alternating current connected in an energization circuit with said motor, a magnetic clutch connecting said motor and said driven member to effect movement of said driven member against said biasing means, said magnetic clutch being energized by a current flow in said motor, a direct current source connected in an energization circuit with said motor, and a timer switch adapted to disconnect said alternating current from said motor and to connect said direct current source to said motor after a predetermined period of operation of the motor and thereby hold said driven member in position against said biasing means.

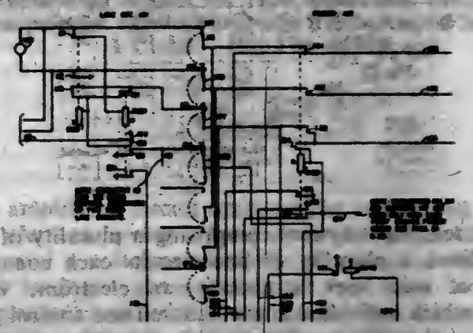
---



2,769,861
REDUCTION OF INTERFERENCE IN PULSE RECEPTION
Harold S. Black, New Providence, N. J., assignor to Bell Telephone Laboratories, Incorporated, a corporation of New York
Application October 21, 1953, Serial No. 387,485
20 Claims. (Cl. 179—15.6)

1. In combination with a source of a train of pulses which are quantized in amplitude and a transmission medium through which they are transmitted, said medium having a distorting transmission frequency characteristic such as to prolong the pulse sent in any pulse interval into adjacent pulse intervals and thus to cause interference between neighboring ones of said pulses, means for reducing said interpulse interference which comprises means for regenerating pulses in amplitude and in time of occurrence, means for deriving from said regenerated pulses a medium-distortion-correction wave, said correction wave deriving means comprising an elongated propagation device having an input terminal, means for applying each said regenerated pulse to said input terminal, a plurality of output terminals spaced along its length, means for adjusting the relative amplitudes of signals derived from said several output terminals, means for combining said amplitude-adjusted signals to provide said correction wave, means for differentially combining said correction wave with said incoming train to provide a difference signal, and means for applying said difference signal to said regenerating means.

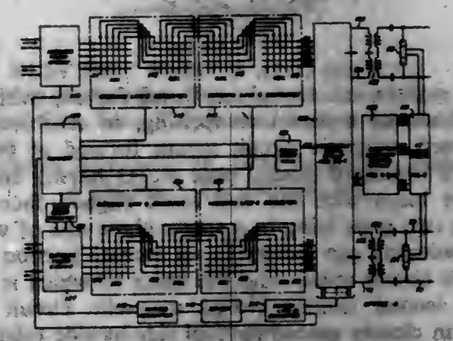
---



2,769,862
CONVERTIBLE INTEROFFICE TRUNK
James D. Canfield, Rochester, N. Y., assignor, by mesne assignments, to General Dynamics Corporation, a corporation of Delaware
Application February 6, 1953, Serial No. 335,445
10 Claims. (Cl. 179—18)

1. In a telecommunication system, a trunk line having a termination circuit at each end thereof, digit discrimination means in each said termination circuit for altering the circuit arrangement thereof, said digit discrimination means in said termination circuits being independent of each other but concurrently responsive to trains of digital impulses transmitted over said trunk line, said digit discrimination means responding in one manner to a single train of digital impulses and responding in another manner to any additional number of trains of digital impulses.

---

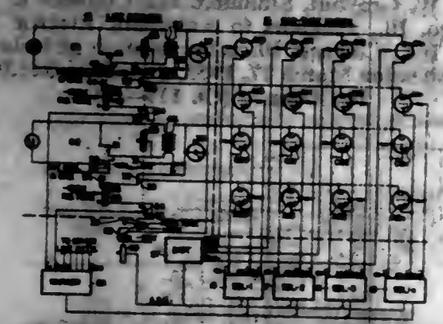


2,769,863
ROTARY FINDER WITH GRADED MULTIPLE
Kenneth W. Graybill, Elmhurst, and Clarence E. Lemax, Chicago, Ill., assignors to Automatic Electric Laboratories, Inc., Chicago, Ill., a corporation of Delaware
Application March 27, 1953, Serial No. 345,628
28 Claims. (Cl. 179—18)

1. In a telephone system having a plurality of allotters of the non-homing type, a plurality of groups of finders available to each allotter in a definite order of priority, certain finders accessible to one allotter being multipled with finders available to other allotters, means in said one allotter for selecting an idle one of the finders accessible thereto, a calling line accessible to said one finder, means whereby said first means is operated in response to a call initiated over said calling line, means in each allotter for preventing the selection of all finders in a group available thereto other than that group having first priority, and means whereby said last means is operated and effective if a finder in a group of preceding priority and all finders multipled therewith are idle.

---

2,769,864
TIME AND TRAFFIC CONTROLLED TRUNKING SYSTEM
Charles O. Parks, East Norwalk, Conn., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application January 8, 1954, Serial No. 402,963
9 Claims. (Cl. 179—18)



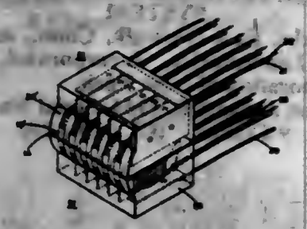
1. In a communication system comprising a group of interoffice trunks, each trunk adapted for use on a call in either direction, a trunk circuit at each end of said trunk arranged for use either as an incoming trunk circuit or as an outgoing trunk circuit, relay means in each trunk circuit for marking the trunk circuit unavailable for use as an outgoing trunk circuit, means in each office determining at intervals the number of trunk circuits in the office to be marked unavailable for use as outgoing trunk circuits, and means in each office for selectively operating or releasing said relay means of one or more trunk circuits in succession to effect the marking of a different number of trunk circuits as unavailable for use as outgoing trunk circuits.

2,769,865

## ELECTRONIC TELEPHONE SYSTEMS

Alfred H. Faulkner, Chicago, Ill., assignor to Automatic Electric Laboratories, Inc., Chicago, Ill., a corporation of Delaware

Application February 20, 1951, Serial No. 211,950
40 Claims. (Cl. 179—18)



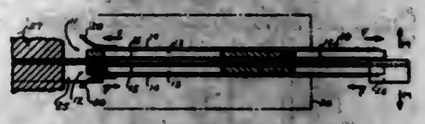
37. A telephone system comprising a plurality of subscriber lines, a plurality of line circuits each connected to one of said lines, a plurality of electronic valves through which individual conversational and control paths are extended on the conditioning of said valves, a number storage device, means responsive to the conditioning of one of said valves for connecting one of said line circuits to said device through said valve, means responsive to the transmission of impulses representing a number over the subscriber line connected to said line circuit for causing said storage device to store said number, and means thereafter effective for completing a conversational path from said one line circuit through said one valve to the line circuit of a called line.

2,769,866

## MAGNETIC TRANSDUCER HEAD

Otto Kornei, Cleveland Heights, Ohio, assignor, by mesne assignments, to Clevite Corporation, Cleveland, Ohio, a corporation of Ohio

Application June 8, 1951, Serial No. 230,455
7 Claims. (Cl. 179—100.2)



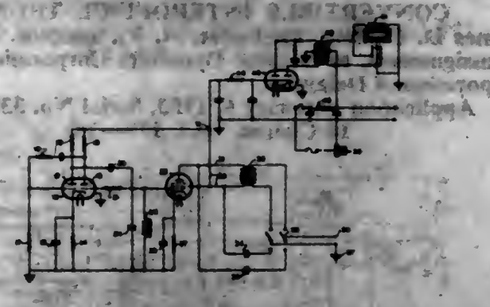
4. A multi-track transducer head for use with a flat strip of record material comprising, in combination: a first closed magnetic circuit means formed of two substantially similar C-shaped pole pieces having end faces and side faces with the end faces aligned face-to-face defining two gaps lying in a single plane one of which is the transducing gap located in an arcuate portion of said magnetic circuit means and the other of which is a back gap, a second similar closed magnetic circuit means aligned in closely spaced parallel side-by-side relationship to said first closed magnetic circuit means with the transducing and the back gaps of both said magnetic circuit means lying in the same plane, first and second coil means respectively about said first and second closed magnetic circuit means, and hardened casting material substantially entirely surrounding said coil means and said closed magnetic circuit means and also lying within the space defined by said closed magnetic circuit means to prevent movement of any of said C-shaped pole pieces with respect to said other pole pieces thereby permanently securing said two closed magnetic circuit means in closely spaced parallel side-by-side relationship to each other, said transducing gaps of said first and second closed magnetic circuit means and said arcuate portions thereof extending to an arcuate surface of said hardened casting material together forming an unbroken arcuate surface for supporting said flat strip of record material.

2,769,867

## DIELECTROSTRICTIVE SIGNAL AND ENERGY TRANSDUCERS

Joseph W. Crownover, Hartsdale, and Helmuth W. Koren, New York, N. Y., assignors to Sonotone Corporation, Elmsford, N. Y., a corporation of New York

Application September 9, 1947, Serial No. 772,934
1 Claim. (Cl. 179—110)



In a piezoelectric signal transducing device for transducing mechanical signals into electric signals or vice versa; at least two solid dielectric ceramic bodies, each body having a thickness of at most about one-hundredth of an inch and being composed essentially of ceramically joined titanate particles consisting predominantly of barium titanate, two metallic surface electrodes fused at elevated temperature to opposite surfaces of each body, a strong flexible elastic sheet metal member having opposite surfaces facing body surfaces of said two bodies, and means including a junction stratum of solidified solder having a melting temperature above normal temperature uniting the facing surfaces of said metal member to the facing surfaces of said two bodies, and causing at least the adjacent surface strata of said two bodies to be maintained by said metal member under compressive strain, said two bodies being electrically unidirectionally permanently polarized to near piezoelectric saturation, said two bodies being polarized in opposite directions for causing said two bodies to conjointly transduce in aiding relation upon deflection thereof.

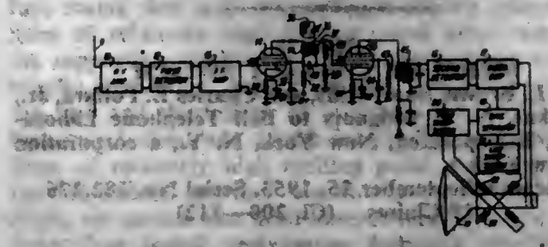
2,769,868

## LINE FAULT DETECTOR

Cecil L. Brownlow, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware

Application February 18, 1952, Serial No. 272,034
1 Claim. (Cl. 179—171)

A signal generator for privading both high voltage and high current audio frequency signals for use in detecting faults in a multi-conductor cable comprising an audio frequency oscillator including a first tube having an anode, a cathode and a control grid, a second tube having an anode, a cathode and a control grid, a first capacitor connected between the control grid of said first tube and a point of reference potential, a first resistor connected in parallel with said first capacitor, a second resistor connected between the cathode of said first tube and said reference potential, a third resistor connected between the cathode of said second tube and said reference potential, a source of potential which is positive with respect to said reference potential, a fourth resistor connected between the anode of said first tube and said source of positive potential, a fifth resistor connected between the anode of said second tube and said source of positive potential, a sixth resistor connected between the control grid of said second tube and said reference potential, a second capacitor and a seventh resistor connected in series between the anode of said first tube and the control grid of said second tube, and an eighth resistor and a third capacitor connected in series between the anode of said second tube and the control grid of said first tube; an amplifier comprising third and fourth tubes each having an anode, a cathode and a control grid, means connecting the control grid of said third tube to the junction between said second capacitor and said seventh resistor, a fourth capacitor connected between the anode of said second tube and the control grid of said fourth tube, a ninth resistor connected between the control grid of said fourth tube and said reference potential, and a tenth resistor connected between said reference potential and the cathodes of said third and fourth tubes; a transformer; means connecting the end terminals of the primary winding of the transformer to the anodes of said third and fourth tubes, respectively; means connecting a center tap on the primary winding of said transformer to said source of positive potential; a fifth capacitor having one terminal connected to the anode of said third tube; a sixth capacitor having one terminal connected to the anode of said fourth tube; first and second output terminals connected to respective end terminals of the secondary winding of said transformer; third and fourth output terminals connected to corresponding second terminals of said fifth and sixth capacitors, respectively; first and second switches adapted to engage said first and second terminals, respectively, in a first position and to engage said third and fourth terminals, respectively, in a second position; a fifth output terminal connected to said first switch; and a sixth output terminal connected to said second switch.

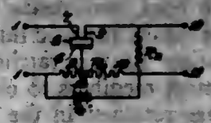


2,769,869

## NEUTRALIZED AMPLIFIER

Lawrence J. Mattingly, Lombard, Ill., assignor to Motorola, Inc., Chicago, Ill., a corporation of Illinois

Application December 2, 1954, Serial No. 472,599
4 Claims. (Cl. 179—171)



1. An amplifier including in combination an electron discharge device having an anode, a cathode, and a plurality of intermediate electrodes between said anode and cathode; means for connecting said cathode to a point of reference potential; means for impressing an input signal on a first of said intermediate electrodes; a transformer having a primary winding connected between said anode and a second of said intermediate electrodes and further having a secondary winding; means connecting said second intermediate electrode to the positive terminal of a unidirectional potential source; first capacitor means connected from said second intermediate electrode to said point of reference potential for neutralizing and by-passing purposes; a load circuit coupled between one side of said secondary winding and said point of reference potential; impedance means connecting the other side of said secondary winding to said point of reference potential; and second capacitor means coupling said other side of said secondary winding to said second intermediate electrode so that the output signal from the amplifier which tends to produce feedback appears effectively across said primary winding, and said first capacitor means having a selected value so as to neutralize the effect of such output signal.

2,769,870

## TRANSISTOR AMPLIFIER CIRCUIT

Johannes Meyer Claver, Eindhoven, Netherlands, assignor to Hartford National Bank and Trust Company, Hartford, Conn., as trustee

Application August 19, 1950, Serial No. 180,390
Claims priority, application Netherlands August 30, 1949
1 Claim. (Cl. 179—171)

An amplifying circuit arrangement comprising a transistor element having a base electrode, an emitter electrode, and a collector electrode, a source of signal potential having a given impedance, an input circuit of said transistor connected between said base electrode and said emitter electrode, said input circuit being connected to said source, an output circuit connected between said collector and said base electrode, said output circuit having an output impedance including a dominant element $R_{22}$ having a value which is equal to $b(R_{21}-R_{12})$ in which

$$R_{21}=\frac{e_2}{i_1}$$

when $i_2=0$ and

$$R_{22}=\frac{e_2}{i_2}$$

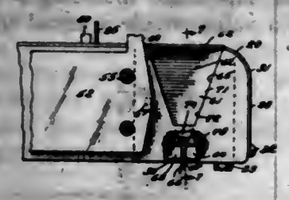
when $i_1=0$, $e_2$ being the variation in voltage between the collector and the base electrode, $i_1$ being the variation in current of the input circuit, $i_2$ being the variation in current in the output circuit, and $b$ being a constant having a value between 0.5 and 1.2, a base impedance $R_0$ having two series-connected portions connected at their junction to said base electrode and being common to both the input and output circuits, said base impedance having a value at which the input impedance of said arrangement matches the impedance of said source, and a single source of potential for said transistor connected in parallel with said entire base impedance.

2,769,871

## ELECTRIC SWITCH AND SOCKET

Rudolf Popp, Valparaiso, Ind., assignor to McGill Manufacturing Co., Inc., Valparaiso, Ind., a corporation of Indiana

Application November 10, 1954, Serial No. 468,057
4 Claims. (Cl. 200—51.06)



1. In a three-way electric switch and lamp socket device for supporting and energizing a dual filament lamp bulb which has contacts on the base thereof, and which socket device includes shell socket means for retaining and electrically contacting a lamp bulb base, a pair of spaced insulating plates secured to the socket means, and rotatable ratchet means disposed between the insulating plates and including actuation and electrical contact cogs therewith, the improvement in such a device comprising the combination of first, second and third electrically conductive separating members disposed in spaced re-

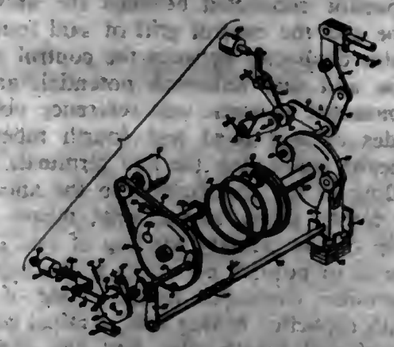
lation between the insulating plates, slidable actuation means supported by the insulating plates and including an arm portion retractably engageable with the actuating cog to cause rotation of the ratchet means, said first separating member having a contact portion extending centrally of and into the socket means for engaging a first contact of a lamp bulb base, a contact member associated with each separating member and engaging the electrical contact cog of the ratchet means, a connector strip disposed on one of the insulating plates and having a portion in engagement with said second separating member and a further portion extending into the socket means adjacent said contact portion for engaging a second contact of a lamp bulb base, and means to supply electrical energy to the socket means and said third separating member, whereby rotation of the ratchet means connects various of said contact members to electrify the contacts of a lamp bulb base retained in the socket means.

---

2,769,872
RAIN DETECTOR ELEMENT
William J. Clark, Jeannestown, Pa.
Original application December 1, 1951, Serial No. 259,460. Divided and this application December 21, 1953, Serial No. 406,530
3 Claims. (Cl. 200—61.05)

2. In a window closer, a generally vertical forwardly inclined electrically insulating rear wall, downwardly converging V-shaped end walls engaging the rear wall and continuing in spaced relation below the bottom of the V to form a drainage opening, electrodes extending through the end wall and toward one another adjacent the bottom of the V, terminating in spaced relation near the bottom of the V, and a generally vertical downwardly extending front wall extending across between the end walls at a position slightly above the bottom of the V and leaving a truncated V-shaped opening above the front wall.

---



2,769,873
KEY OPERATED MULTIPLE ELECTRIC CIRCUIT SWITCH
Maurice J. Norregaard, Burbank, Calif.
Application December 6, 1952, Serial No. 324,452
12 Claims. (Cl. 200—87)

1. An electric switch comprising, in combination, a locking pin section, a pair of electrical contacts adapted for connection to an electric circuit, locking members in the locking pin section having a cooperating pair of openings arranged therein adjacent said pair of contacts, a locking pin member reciprocative longitudinally with respect to the locking members, a locking pin magnet disposed for transverse movement in the locking pin member and arranged for registration with the openings in the locking members, said magnet being normally inserted within one of said openings, and actuator means extending from one contact of said pair of contacts into the one of the pair of openings normally unoccupied by the locking pin magnet, the locking pin magnet registering with the openings being adapted upon activation by a magnetic force to be drawn into engagement with the actuator means whereby to move the latter and actuate the contacts as the locking pin member is moved.

2,769,874
CLOSING MECHANISM FOR AN ELECTRIC CIRCUIT BREAKER
Thaliwell R. Coppeskall, Cynwyd, and Ugo R. Tognella, Philadelphia, Pa., assignors to General Electric Company, a corporation of New York
Application June 2, 1955, Serial No. 512,638
17 Claims. (Cl. 200—89)

4. In an electric circuit breaker, motive means operable to effect closing thereof, a rotatable control member having an initial position, means for initiating operation of said motive means in response to rotation of said control member from its initial position through a fraction of a revolution, said initiating means being ineffective to initiate another operation of said motive means until said control member is returned to said initial position, a selectively-operable actuating member movable out of a normal position to rotate said control member through said fraction of a revolution thereby to initiate operation of said motive means, and resetting means operable in response to said initiation for further rotating and returning said control member to its initial position, said actuating member when displaced from its normal position being arranged to block the return of said rotatable control member to its initial position.

---

2,769,875
MERCURY CONTACT SWITCH
John T. L. Brown, Short Hills, and Charles E. Pollard, Jr., Hoboken, N. J., assignors to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application September 25, 1953, Serial No. 382,276
19 Claims. (Cl. 200—112)

1. A mercury contact switch comprising mercury wettable contacts, a capillary reservoir having constant bore capillaries, an armature mating with said contacts and providing a mercury path from said reservoir to said contacts, and a drain element for returning displaced mercury from said contacts to said reservoir upon the operation of said armature.

---

2,769,876
ELECTRIC SWITCHING DEVICE
Herbert J. Mansmann, Bridgeport, Conn., and William T. Passy, Buffalo, N. Y., assignors to General Electric Company, a corporation of New York
Application September 6, 1951, Serial No. 245,334
12 Claims. (Cl. 200—113)

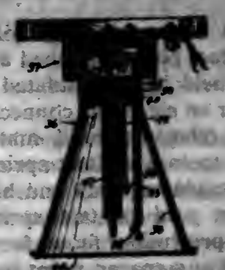
1. In an electric switching device for controlling an electric circuit, a stationary solid contact adapted for being electrically connected to one side of the circuit to be controlled, means mounting said stationary contact, a bimetallic element supported at one end, a movable solid contact mounted on a free portion of said bimetallic element and adapted for being electrically connected to the other side of said circuit, said movable solid contact being positioned to engage said stationary solid contact at a predetermined temperature of said bimetallic element thereby to complete said circuit, a pool of mercury spaced from said contacts, and means for wetting said contacts with mercury from said pool.

---

2,769,877
TIME DELAY FUSE
Edward V. Sundt, Wilmette, Ill., assignor to Sundt Engineering Company, Des Plaines, Ill., a corporation of Illinois
Application December 24, 1954, Serial No. 477,543
10 Claims. (Cl. 200—131)

1. A time delay fuse for protecting an electric circuit comprising, an elongated supporting member formed of electrical insulating material resistant to high temperatures, a first film of relatively low melting point fuse metal carried by the supporting member intermediate the ends thereof and in intimate contact therewith, second and third films of relatively low melting point fuse metal carried by the supporting member in intimate contact therewith and in longitudinally spaced relation from each end of the first film of relatively low melting point fuse metal, first and second longitudinally spaced apart films of relatively high melting point metal carried by the supporting member and extending between and electrically connecting, respectively, the first and second and the first and third films of relatively low melting point fuse metal, third and fourth longitudinally spaced apart films of relatively high melting point metal carried by the supporting member electrically contacting, respectively, the second and third films of relatively low melting point fuse metal, and means including electrical terminals connected to the third and fourth films of relatively high melting point metal for connecting the same into the electric circuit to be protected, a sustained overload in the electric circuit causing the first of relatively low melting point fuse metal to heat to the melting point thereof for breaking the electric circuit with the rate of heating thereof being delayed by the supporting member in intimate contact therewith, and a sudden short in the electric circuit promptly heating the first, second and third films of low melting point fuse metal to their melting points for promptly breaking the electric circuit.

---

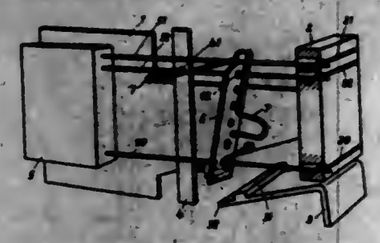


2,769,878
DEEP FAT FRYER
Carl V. Krichten, Geneva, Ill., assignor to McGraw Electric Company, Elgin, Ill., a corporation of Delaware
Application October 14, 1953, Serial No. 385,924
9 Claims. (Cl. 200—137)

7. A combined thermostat and safety switch structure for use with a heating unit adapted to be removably placed in a heating position on a support in which position the unit is located to act upon a substance to be heated, comprising base means, a pair of arms pivotally mounted on said base means, an electrical contact element fixed on each of said arms, heat responsive means for repeatedly actuating one of said arms toward and away from the other of said arms, and push button means slidably mounted on said base means and connected with said other arm, said push button means extending beyond said base means for engagement with said support when the heating unit is in said heating position so that the push button means is actuated to support said other arm in an operative position, and said push button means being operable upon removal of the heating unit from said heating position to permit said other arm to move to an inoperative position.

---

2,769,879
BIMETALLIC ELECTRICAL SWITCH MECHANISM, FOR FIRE DETECTING APPARATUS
Rudolf Steiner, Tullytown Township, Bucks County, Pa.
Application September 23, 1953, Serial No. 382,019
10 Claims. (Cl. 200—138)
(Granted under Title 35, U. S. Code (1952), sec. 266)



1. In a thermal-responsive device for a fire-protection system, at least two bimetallic elements flexible thermal-responsively for a given operation involving two way movement, a mount for the elements holding them for thermal-responsive flexing each alternatively in opposite directions for respective opposite movements of operation, the mount holding the several elements oriented to flex respectively oppositely for operation movements under a given temperature change, an envelope containing one only of the two bimetallic elements and comprising heat-insulating material resisting thermal response in the element to atmospheric temperature changes, the second of the two bimetallic elements being open to the atmosphere.

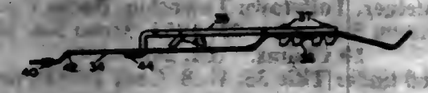
CONTACT DEVICE FOR CROSS BAR SWITCHES
Gert Erik Olof Holmqvist, Stockholm, Bengt Erik Björkland, Hägersten, and Arne Kurt Dittrich, Enskede, Sweden, assignors to Telefonaktiebolaget L M Ericsson, Stockholm, Sweden, a corporation of Sweden
Application June 14, 1955, Serial No. 515,982
Claims priority, application Sweden July 9, 1954
2 Claims. (Cl. 200—166)

1. A contact device for cross bar switches comprising a number of parallel contact springs situated in the same



plane and rigid contacts corresponding to said contact springs, a lifting bar which is lifted by a movable actuating means and puts said contact springs in contact with the rigid contacts, and a movable selecting bar, which must be in a determined position so that the movement of the actuating means is transmitted to the lifting bar, characterized by the lifting bar being movable in relation

to the contact springs and by an elastic lever, which is rigidly fixed on the lifting bar and arranged mainly in parallel with the contact springs and the free end of which is moved by said selecting bar in a direction which is perpendicular to the contact springs and parallel with the plane of the contact springs, the lifting bar being swung in the plane of the contact springs.

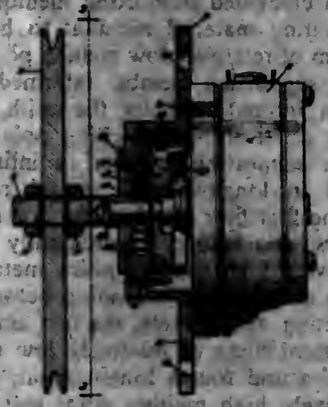
2,769,881
**CONTACT ASSEMBLY FOR ELECTROMAGNETIC RELAYS**
William D. Halles, Rochester, N. Y., assignor to General Railway Signal Company, Rochester, N. Y.
Application March 15, 1954, Serial No. 416,373
10 Claims. (Cl. 200—166)

1. In a contact finger assembly for relays, a contact spring having contact points attached at one end and having its other end held by an insulated block with a portion protruding for an electrical connection, a single backstop member of relatively rigid material located substantially parallel to said contact spring and having one end held by said insulated block and having its other end extending adjacent said contact spring, said backstop member having a protruding finger for hooking into said contact spring and at a spaced point having an extending detent, said detent and finger acting to hold said contact spring relatively stable.

---



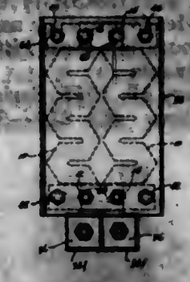
2,769,882
**ELECTRIC SWITCHES**
Maurice B. Vitus, Maurice B. Vitus, Jr., and Carlton J. Vitus, Eugene, Oreg.
Application November 10, 1952, Serial No. 319,722
1 Claim. (Cl. 200—168)

An electric switch assembly comprising a casing having an open top, a rigid cover closing said open top, a flexible diaphragm disposed between said cover and said open top and constituting a sealing gasket preventing fluid leakage into and from the interior of said casing around said cover, a switch housed within said casing underneath said diaphragm and cover, means fastening said switch to said cover, means disposed between said switch and said diaphragm and spacing said switch from said diaphragm and pressing said diaphragm into continuous engagement with the undersurface of said cover, said cover having an opening therethrough whereby a portion of the diaphragm surface is exposed to serve as a switch actuator, said switch having a push button in registry with the exposed portion of the diaphragm surface for operating said switch in response to depression of the exposed portion of said diaphragm, said spacing means maintaining the exposed portion of said diaphragm in abutting relation with the undersurface of said cover around said cover opening and defining a restricted passage between said diaphragm and said switch coincident with said cover opening and enclosing said push button, a flat rigid disc within said passage underlying the exposed surface of said diaphragm and having a downturned peripheral flange, and a coil spring disposed around said push button and seating within the periphery of said disc flange and reacting between said disc and said switch for forcing said disc into abutment with said diaphragm to assist in maintaining a fluid-tight seal between said diaphragm and said cover and inhibiting stretching of said diaphragm and accidental actuation of said push button.

---

2,769,883
**SPRING-LOADED ROTARY TYPE TRANSDUCER**
Francis M. Eckert, Arlington, Richard J. MacDonnell, Dallas, and Paul H. Villars, Grand Prairie, Tex., assignors to Chance Vought Aircraft, Incorporated, Dallas, Tex., a corporation of Delaware
Application October 14, 1954, Serial No. 462,301
10 Claims. (Cl. 201—48)

1. A convertible spring-loaded rotary type electrical position transmitter for receiving rotary motion from a movable element and transmitting it in the form of an electrical signal to an oscillograph comprising, a potentiometer adapted to contain a wiper arm, a rotatable shaft means secured in said potentiometer for connection to the wiper arm and rotatable therewith, said potentiometer supported by a housing means, said housing means having a large opening therein, said shaft protruding through said large opening, removable cooperating stop means internally of said housing means and mounted on both of said housing means and said shaft means for limiting the amount of rotation of said shaft relative to said potentiometer to substantially one turn whereby said stop means is easily removable for converting the single-turn transmitter to a multi-turn transmitter, and a flat spiral spring in said opening around said shaft, one end of said spring secured to said shaft and the other end of said spring secured to the edge of said large opening in the housing whereby the potentiometer wiper is always biased towards a constant and fixed point of origin, said flat spiral spring maintaining a uniform and constant torque throughout the range of operation of said potentiometer.

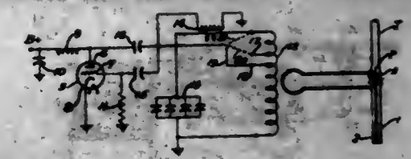


2,769,884
**BOLOMETER**
Maxie G. Jacobson, Penn Township, Allegheny County, Pa., James C. Gillett, Columbus, Ohio, and Frank J. De Luca, Pittsburgh, and Walter F. Mrak, McKees Rocks, Pa., assignors to Mine Safety Appliances Co., Pittsburgh, Pa., a corporation of Pennsylvania
Application April 10, 1952, Serial No. 281,632
9 Claims. (Cl. 201—63)

1. A sensitive element for the measurement of heat exchange with a surrounding medium comprising: a flexible member with a high temperature coefficient of electrical resistance, two terminals electroconductively joined to the ends of said member for leading electric current to and from said member, a flexible member of high thermal conductivity, a thin layer of electric insulation on one of said members, one of said members being tightly coiled around the other member to form a substantially solid composite element of high thermal and relatively low electrical conductivity and said composite element being wound in the shape of a conical coil.

---

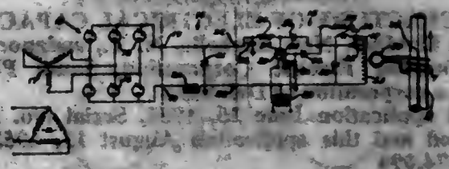
2,769,885
**RESISTOR UNITS**
Allan P. Charbonneau, Wauwatosa, Wis., assignor to Cutler-Hammer, Inc., Milwaukee, Wis., a corporation of Delaware
Application April 26, 1954, Serial No. 425,627
10 Claims. (Cl. 201—69)



1. In a resistor unit, in combination, a plurality of resistor grids each having a pair of end lugs, each of said lugs having formed therein a pair of spaced cutouts, each of said grids further having a body portion bridging its pair of lugs and lying wholly on one side of a line extending from a point midway between the cutouts of one lug to a point midway between the cutouts of the other lug, said grids being stacked with the body portions of successive grids reversed, a first pair of supporting rods each being disposed in an associated cutout of one lug of each of said grids, a second pair of support rods each being disposed in an associated cutout of the other lug of each of said grids.

---

2,769,886
**INDUCTION HEATING AND WELDING**
Thomas J. Crawford, Berkley, Mich.
Application April 24, 1954, Serial No. 424,577
5 Claims. (Cl. 219—8.5)

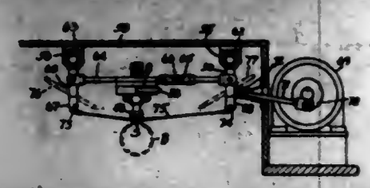


1. In apparatus for the production of welded tubing from a tubular blank having an open longitudinal seam, which apparatus includes a heating coil adapted to have such blank moved therethrough and means adapted to force the opposed edges of such seam together at a point spaced beyond but adjacent the effective field of the coil, the improvement comprising a radio-frequency transformer having a primary inductance of a predetermined number of turns and a single turn secondary in the form of a closely coupled split metal cylinder, means connecting said coil to such single turn secondary so as to be supplied energy by said transformer, a plurality of taps respectively on separate turns of such inductance intermediate the ends thereof, a capacitance connected across the predetermined number of turns of such inductance to form a tuned circuit therewith, a tube oscillator, and

means connecting such tuned circuit in the anode circuit of said oscillator including a connection through a blocking condenser between the oscillator anode and one of said taps on the inductance, the voltage across the tuned circuit thereby being greater than the normal oscillator anode voltage due to step-up auto-transformer effect in such inductance, whereby the energy supplied to the coil is greater than that normally obtainable from the tuned circuit when an end of the inductance is connected through the blocking condenser directly to the oscillator anode.

---

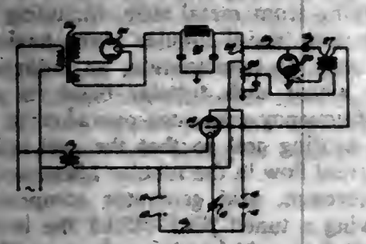
2,769,887
**HIGH SPEED INDUCTION WELDING**
Thomas J. Crawford, Berkley, Mich.
Application May 17, 1954, Serial No. 430,086
5 Claims. (Cl. 219—8.5)



1. In apparatus for high speed continuous production of welded tubing from metal strip, including a mill for forming such strip into a tubular blank having an open longitudinal seam, in combination, an induction heating coil through which such tubular blank is adapted to pass, a high-frequency generator operative to supply energy to said heating coil so that the coil induces high-frequency current flow in the tubular blank as the latter is passed therethrough, said generator comprising a tube oscillator having a tuned plate circuit the inductance of which is coupled to said heating coil, a rectifier adapted to be connected to a conventional source of alternating current and to provide an output voltage for the plate supply of the oscillator tube, such rectifier output voltage normally including an alternating voltage component in addition to the desired direct current voltage, a filter connected between said rectifier and oscillator operative substantially to remove such alternating component of the rectifier output voltage and deliver to the oscillator plate a voltage of substantially constant magnitude, thereby substantially to eliminate the amplitude variation of the high-frequency output oscillations of the oscillator and the consequent fluctuation of the heat level produced in the tubular blank by the induced current flow therein which would result if the rectifier output alternating component is not thus substantially removed, and pressure means spaced from and following said heating coil operative to force the opposed edges of such seam together at a point beyond but adjacent the effective field of the coil, the induced current flow thereby being concentrated in the opposed seam edges and at their point of juncture, the concentration of current and the substan-

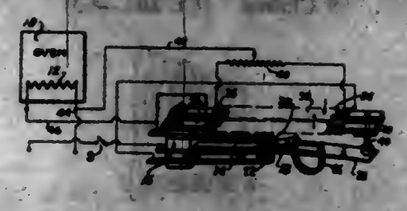
tially constant heat level produced thereby in the blank permitting welding of the seam edges at high speed without stitching thereof.

---



2,769,888
INDUCTION MEANS
Paul J. Abel, Cleveland, Ohio, assignor to The Yoder Company, Cleveland, Ohio, a corporation of Ohio
Application May 25, 1954, Serial No. 432,290
25 Claims. (Cl. 219—8.5)

1. In apparatus for the continuous manufacture of welded tubing including forming means operative to form a continuous metal strip to generally tubular form with the edges of such strip closely opposed in a continuous longitudinal seam, and means operative continuously axially to advance the same; electric induction means operative to induce heating current in the tubular blank thus formed in the region of such seam only to heat the opposed seam edge portions to welding temperature, pressure means at a closely following station adapted to force such heated opposed seam edges together in welding engagement, and a web of non-magnetic, electrically non-conductive, heat resistant material interposed between such tubular blank and said induction means.



---

2,769,889
MANUFACTURE OF ELECTRICAL CAPACITORS
William Dubilier, New Rochelle, N. Y., assignor to Cornell-Dubilier Electric Corporation, South Plainfield, N. J., a corporation of Delaware
Original application June 25, 1951, Serial No. 233,315. Divided and this application August 13, 1953, Serial No. 374,094
4 Claims. (Cl. 219—19)

3. Apparatus for clearing short circuits and faults in electrical capacitors comprising a storage capacitor, a charging circuit connected across said storage capacitor including a source of direct current voltage in series with a high-ohmic charging resistor, a gaseous discharge tube having a pair of main electrodes and a discharge initiating control electrode, a discharging circuit also connected across said storage capacitor including the main discharge path of said tube in series with a capacitor to be cleared, means for applying a steady bias potential to said control electrode close to and below the breakdown potential of said tube, and a relaxation oscillator comprising a further resistor in series with a further capacitor shunted by a gaseous discharge tube to produce a periodic control potential, means to apply said control potential to said control electrode superimposed upon said bias potential to periodically raise said bias potential above the breakdown potential of said tube, the time constant of said further capacitor and resistor being in excess of the time constant of said storage capacitor and charging resistor.

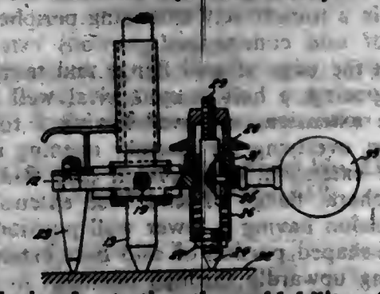
2,769,890
HEAT CONTROLLER
Theodore W. Hallerberg, Los Angeles, and Jacob L. Pauly, Inglewood, Calif., said Pauly assignor to said Hallerberg
Application May 25, 1954, Serial No. 432,284
1 Claim. (Cl. 219—20)

Control apparatus for an electric heating circuit comprising a power source, a load coil, a double-throw switch to connect said load coil to said power source periodically, means to actuate said switch comprising, a bimetallic element (30) tending when heated to move said switch to closed position, a first heating coil (34) associated with said bimetallic element, a second bimetallic element (32) tending when heated to move said switch to open position, a second heating coil (36) associated with said second bimetallic element, connections to establish a circuit from said power source through said second heating coil and said load coil in parallel when said switch is in one position, connections to establish a circuit only through said first heating coil when said switch is in its other position, and means to vary the resistance of at least one of said heating coil circuits and thereby vary the relative duration of the cycle of operation of said double-throw switch.

---

2,769,891
ELECTRIC IMMERSION HEATER
John W. Harrison, Meadville, Pa., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application January 10, 1955, Serial No. 480,641
4 Claims. (Cl. 219—38)

1. An immersion heater for mounting in the wall of a liquid containing receptacle comprising a sheath having an electrical resistance element therein, said sheath having adjacent, generally parallel end portions, a corrosion resistant sheet, said end portions extending through said sheet with a fluid-tight seal therebetween, a clamping plate having a central opening and a flat surface abutting said sheet, an insulating block abutting said plate and having a recess therein aligned with the opening in said plate, said recess and central opening defining a cavity within which the ends of said sheath terminate, said block having a passage therethrough providing access to said cavity, an electrical terminal connected to said element and extending from within each end of said sheath, through said passage and exteriorly of said block, and a settable electrically insulating sealing material disposed in said cavity, said material being in a set condition and providing a hermetic seal between said terminals and said sheath, said passage being of sufficient size to readily permit pouring of said insulating material into the cavity prior to the setting of the material.



2,769,892
ELECTRICAL HEATING DEVICE
Donald F. Collins, Grand Rapids, Minn.
Application May 4, 1953, Serial No. 352,718
1 Claim. (Cl. 219—46)

A therapeutic heating device comprising an electrically heated unitary insulating pad having overlapping opposed surfaces with an electrical heating element therebetween for supplying warmth outwardly through the surfaces, said pad constituting a pair of general L-shaped areas each having an upright portion and a base portion extending laterally therefrom, said upright portions being connected at their back edges in a fold line and with the respective base portions extending outwardly in opposed directions, and cooperating zipper closures extending from adjacent said fold line along the lower peripheral margin of said base portions, then extending upwardly and inwardly along the upper peripheral margin of said base portions then upwardly along the adjoining edge of said upright portions to terminate at the upper edge thereof, whereby the device may be folded along said fold line with said L-shaped areas in overlapping relation and said zipper closure fastened to form an encasing boot for warming the hands or feet and when the device is unfolded forms a flat pad for use as a conventional warming pad.

---

2,769,893
ELECTRICAL DEVICE FOR TESTING THE WELDABILITY OF METALLIC MATERIALS
Josef Müller, Duisseldorf, Germany
Application July 8, 1952, Serial No. 297,708
Claims priority, application Germany July 12, 1951
4 Claims. (Cl. 219—109)

4. In a device for testing the weldability of a metallic specimen, means for holding an electrode adjacent said specimen, said means including a clamp for said electrode, a plurality of pins supporting said clamp and engageable with the specimen, one of said pins being resiliently mounted whereby its effective length may be varied, and a stop for predetermining the extended length of said resiliently mounted pin, said clamp being movable between a first position in which said resiliently mounted pin is retracted and said electrode contacts said specimen, and a second position in which said resiliently mounted pin is extended and said electrode is held a predetermined distance from said specimen.

---

2,769,894
RARE GAS WELDING TORCH
Walter L. Hyer, Jacksonville, Fla.
Application January 27, 1953, Serial No. 334,359
7 Claims. (Cl. 219—139)

1. In a gas-blanketed arc welding apparatus comprising a torch having an electrode and a nozzle, an electrical circuit for passing welding current through said electrode and the work, a conduit for delivering gas to said nozzle, and a valve for controlling the supply of gas to said conduit, means extending above said torch and carried thereon for controlling said valve during shielding of the electrode prior to striking the arc and during cooling of the electrode comprising an exposed contact member movable in accordance with pressure exerted thereon upon engaging said contact member with a grounded object, variable electric resistance means electrically connected between said contact member and said electrode

and associated with said contact member to vary the electrical resistance of said resistance means in response to pressure variations on said contact member, and time delay valve control means responsive to current variations in said electrical circuit caused by variation in the resistance of said resistance means for opening said valve immediately following elevation of the current in said circuit above a preselected minimum current value and maintaining said valve open continuously until a preselected time following reduction of the current in said circuit below said minimum current value.

---

2,769,895
FLASHLIGHT SUPPORT FOR FIREARMS
Charles William Boord, Martin, Pa.
Application January 10, 1956, Serial No. 558,383
2 Claims. (Cl. 240—6.41)

1. For use with a rifle barrel, a device for supporting a flashlight comprising an inverted U-shaped member adapted to be arranged so that the bight thereof overlies the barrel with the legs exteriorly of the side portions of the barrel, a horizontally disposed flange projecting from the free end of each of the legs of said member, said flanges facing in opposite directions, a first horizontally disposed plate positioned below said flanges and extending from one flange to the other of the flanges, an inverted semicircular hood projecting transversely of said plate at each end of the latter, a second horizontally disposed plate arranged below and in parallel relation with respect to said first plate, an upstanding semicircular saddle projecting transversely of said second plate at each end of the latter, the hoods of said first plate being in registry with the saddles of said second plate and forming with the saddles of said second plate a pair of clamps for embracingly supporting the intermediate portions of flashlights, and means extending through said flanges and said first and second plates for attaching said plates to said member.

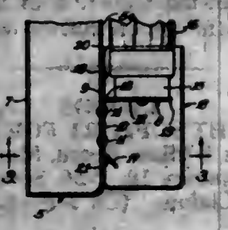
---

2,769,896
FLASHLIGHT SWITCH
Reuben B. Lambert, New Haven, Conn.
Application January 7, 1953, Serial No. 329,967
8 Claims. (Cl. 240—10.6)

3. In a flashlight, an elongated hollow metallic casing containing an electric battery therewithin and having a reflector head at its forward end, a lamp bulb located

within said reflector head and engaging said battery, a conductor element electrically connected with said lamp bulb and having a portion projecting outwardly through said casing and insulated therefrom, a separate metallic ring switch member mounted for longitudinal sliding on the exterior of said casing and having an inner surface

for electrically engaging said outwardly projecting portion, means to limit the slidable movement of said switch member with respect to said casing in both directions, said outwardly projecting portion lying within said ring out of contact with said switch member in "off" position, and contacting with said switch member in "on" position.



---

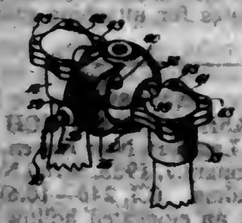
2,769,897

**FLUORESCENT LIGHT FIXTURE**

Stanley J. Rzeznicki, Chicago, Ill., assignor to The Hess Company, a corporation of Illinois

Application December 21, 1954, Serial No. 476,622
7 Claims. (Cl. 240—51.11)

1. in a fluorescent light fixture: a hollow, generally rectangular body member adapted to be secured to a base; a pair of aligned, parallel bracket members fixedly secured in outwardly extending perpendicular relationship to said body member adjacent its ends to receive sockets for a fluorescent tube; a lug secured to the body member between each of said brackets and the adjacent end of the body member, each said lug having a portion extending longitudinally away from the bracket in spaced relationship to the body member to form a recess which opens toward the adjacent end of the body member; and a pair of cuplike friction caps to conceal the brackets and the sockets thereon, each of said caps having a longitudinal slot the side margins of which flank one of said lugs and are frictionally engaged adjacent their forward ends with the bracket and having its wall at the base margin of said slot frictionally gripped in the recess between the lug and the body member.



---

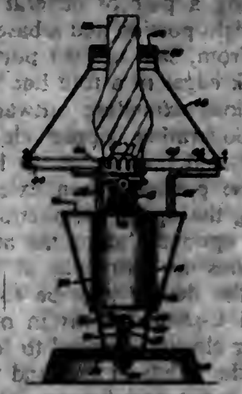
2,769,898

**ELECTRICAL RECEPTACLES**

Rudolph Popp, Valparaiso, Ind., assignor to McGill Manufacturing Company, Inc., Valparaiso, Ind., a corporation of Indiana

Application June 26, 1953, Serial No. 364,462
6 Claims. (Cl. 240—81)

1. An electric lamp cluster including in combination a disk-shaped hollow body having a switch receiving recess formed in one side thereof and protruding radially outwardly therefrom and further having an edge with at least one semi-circular opening formed therein, at least one lamp socket having a swivel joint disposed in the aforesaid opening, and a disk-shaped cover member having an edge with a semi-circular opening formed therein to cooperate with said opening in said body and constitute therewith a socket for the aforesaid lamp socket, and said cover having a portion extending radially outwardly to enclose said switch receiving recess.



---

2,769,899

**TABLE LAMP CONSTRUCTION**

Joseph S. Mclnnis, Chicago, Ill., assignor to Arnold A. Schwartz, doing business as Metallic Arts, not inc., Chicago, Ill.

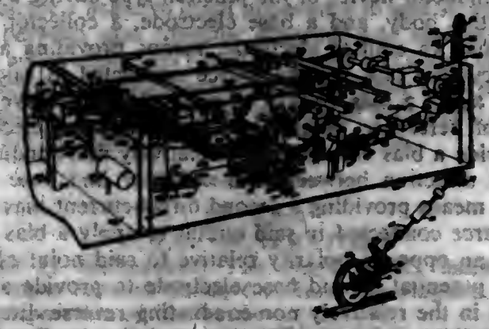
Application June 13, 1955, Serial No. 515,063
3 Claims. (Cl. 240—83)

1. A lamp construction comprising a base in the form of an inverted shallow cone-shaped dish having an axially located tapped bore therethrough, a bolt positioned in said bore and extending upwardly therefrom, a base extension positioned on said base, said base extension in the form of hollow double tapered cone-shaped portions, the smaller of said cone-shaped portions having a bottom wall disposed on the top of said base and the upper end terminating in a transversely extending peripheral flange, the larger of said cone-shaped portions extending upwardly from the edge of said flange and terminating in a circular opening, a hollow cylindrical well positioned in said base extension, said well having a top circular cover portion overlying the circular opening in the top of said base extension, a peripheral base flange resting on the peripheral flange of said base extension and a tapered extension having a lower wall positioned in the smaller cone-shaped portion of said base extension, said bolt extending upwardly through openings in both said base extension and said well to fasten the same rigidly to said base, a cylindrical fuel container positioned in said well, a lamp on said fuel container.

---

2,769,900

**TRAIN CONTROL APPARATUS**



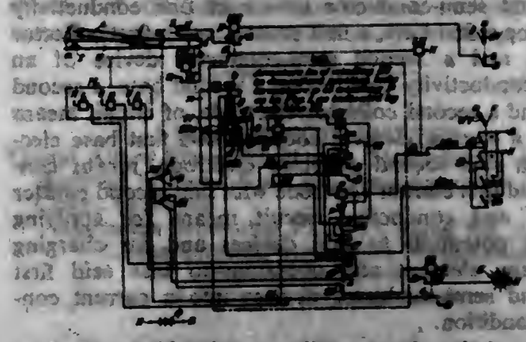
Evangeline Mello, Philadelphia, Pa.

Application May 26, 1951, Serial No. 228,493
12 Claims. (Cl. 246—182)

1. In a train control apparatus, the combination with a vehicle having a brake system provided with the usual manually operated control mechanism, of an electric circuit including a visible clear signal, a second electric circuit including visible and audible preliminary warning signals, means to close either of said circuits and simultaneously open the other of said circuits, electro-magnetic means for operating the circuit closing means to normally maintain the clear signal circuit closed and the preliminary warning signal circuit open, a valve for initially causing a limited application of the brake system inde-

pendently of the manually operated mechanism, a secondary audible warning signal connected with and actuated by the operation of said valve, means to normally urge said valve towards the inoperative position, a second valve for gradually completely operating said brake system also independently of the manually operated mechanism, electro magnetic means normally maintaining said second valve in the inoperative position, separate operating hooks for respectively engaging each of the valve operating means and the signal circuit closing means independently of one another, a supporting bar disposed beneath the forward ends of all of said operating hooks, means to raise and lower said supporting bar, said means including a fluid tight cylinder with a piston slidably mounted therein

and provided with a shank connected to said supporting bar, a fluid inlet and outlet for the cylinder both above and below the piston, a fluid control valve connected with said inlets and outlets to simultaneously open one inlet and one outlet on one side of the piston and close one inlet and one outlet on the other side of said piston, mechanism to intermittently operate said fluid control valve to lower the supporting bar, electro-magnetic means to operate the fluid control valve to elevate the supporting bar, means to reciprocate the operating hooks longitudinally, means to oscillate the rear ends of operating hooks perpendicularly, a secondary electric circuit including the several electro-magnet means in series and a relay contact, and a primary electric circuit connected with track circuits and including a relay to control the relay contact.



---

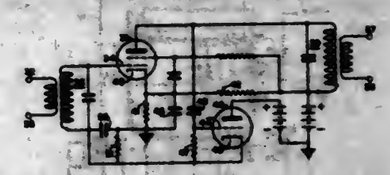
2,769,901

**RAILWAY SWITCH CONTROLLING APPARATUS**

Arthur E. Dodd, Edgewood, Pa., assignor to Westinghouse Air Brake Company, a corporation of Pennsylvania

Application June 16, 1951, Serial No. 231,977
5 Claims. (Cl. 246—219)

3. In combination, a railway track switch, a polarized switch control relay mounted in a given location and embodying a polar armature and a neutral armature, pole-changing means operable to a normal and a reverse position, traffic responsive means normally energized but becoming deenergized in response to a train adjacent said switch on a route in which said switch is included, means controlled by said pole-changing means in its normal and reverse positions for operating said polar armature to its normal and reverse positions respectively and operating said neutral armature to an energized position only if said traffic responsive means is energized, retaining means for keeping said neutral armature in its energized position after said switch control relay becomes deenergized, means rendering said retaining means ineffective to keep said neutral armature in the energized position if said switch control relay is removed from said given location, and means controlled by said neutral armature in the energized position and by said polar armature in its normal and reverse positions for effecting operation of said switch to normal and reverse positions respectively.



---

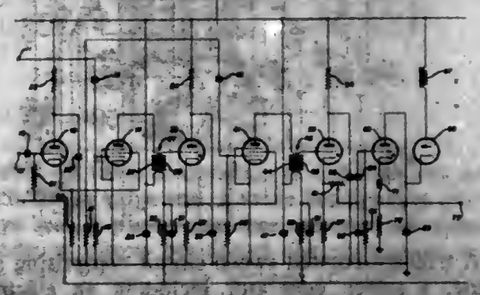
2,769,902

**RECEIVER FOR PULSE SIGNALING SYSTEM**

Irving H. Page, Washington, D. C.

Application October 11, 1945, Serial No. 621,670
5 Claims. (Cl. 250—20)
(Granted under Title 35, U. S. Code (1952), sec. 266)

1. An echo ranging system comprising means for receiving an echo signal consisting of a wave train, amplifier means for the received signal, said amplifier means comprising an electron tube having at least an anode, a cathode and a control element, means for applying a negative bias voltage to the control element with respect to the cathode, means for superimposing the signal on the bias voltage, means for deriving from the signal output of the amplifier a uni-directional voltage substantially equal to the peak amplitude of the signal, a delay circuit having a time constant of the order of the echo signal duration, means for transmitting the uni-directional voltage through the delay circuit to progressively increase the bias voltage in a negative direction, and means for reducing the time constant of the delay network upon termination of the echo signal.



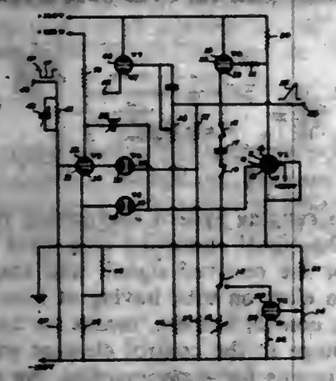
---

2,769,903

**PULSE FORMING NETWORK**

Gordon Donald Pearce, El Cerrito, Calif., assignor to the United States of America as represented by the United States Atomic Energy Commission

Application June 23, 1953, Serial No. 363,601
5 Claims. (Cl. 250—27)



1. In a pulse forming network, the combination comprising a first coincidence circuit having a pair of inputs and an output, one of said inputs adapted to be connected to a source of radio-frequency signal voltage, the other of said inputs adapted to be connected to a source of synchronizing voltage, said first coincidence circuit including peaking means forming pulses at peak values of said signal voltage, a second coincidence circuit having a pair of inputs and an output, one of said inputs adapted to be connected to said source of radio-frequency signal voltage, the other of said inputs being connected to the output of said first coincidence circuit, said sec-

cod coincidence circuit also including peaking means forming pulses at peak values of said signal voltage, a triode gaseous discharge tube having a control grid coupled to the output of said second coincidence circuit and adapted to develop a rectangular voltage in a cathode circuit of such tube in response to the output of said second coincidence circuit, a resonant charging output circuit, and a variable resistance-capacitance network connected between the cathode of said triode tube and said resonant charging circuit.

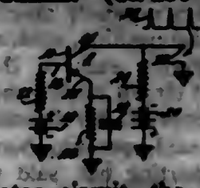
2,769,904
GATED SWEEP GENERATOR
Richard L. Rapicavoli, Portland, Oreg., assignor to Tektronix, Inc., Portland, Oreg., a corporation of Oregon
Application August 18, 1953, Serial No. 374,958
14 Claims. (Cl. 250—27)

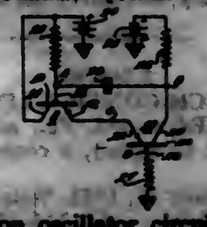
1. A sweep generator adapted to be actuated by a gate source and comprising an electron discharge device having a grid and a plate, a capacitor connected between said grid and plate, resistance means connecting the grid to a source of potential, degenerative direct current feed back means connected between the grid and plate and including a pair of series-connected diodes, and means for connecting a gate source between said diodes.



---

2,769,905
SWEEP CIRCUIT
Richard L. Rapicavoli, Portland, Oreg., assignor to Tektronix, Inc., Portland, Oreg., a corporation of Oregon
Application August 18, 1953, Serial No. 374,957
12 Claims. (Cl. 250—27)

1. A trigger-actuated sweep circuit comprising a multivibrator, a sweep generator including an electron discharge device having a grid and a plate, a capacitance, means connecting the capacitance between said grid and plate, means connecting said grid to a source of potential, degenerative direct current feedback means connected between said grid and plate and including a pair of series connected diodes, means connecting the multivibrator between said diodes, means connecting the sweep generator electron discharge device output to the multivibrator, a resistance-capacitance network, means connecting said network to the multivibrator, and signal mixing means connecting said network and a trigger source to the multivibrator.



2,769,906
JUNCTION TRANSISTOR OSCILLATOR CIRCUITS
Marshall C. Eldd, Haddon Heights, and Werner Hasenberg, Camden, N. J., assignors to Radio Corporation of America, a corporation of Delaware
Application April 14, 1954, Serial No. 423,126
9 Claims. (Cl. 250—36)

1. In an oscillator circuit, the combination with a semi-conductor device of the junction type having a semi-conductive body, and a base electrode, a collector electrode and an emitter electrode, means providing a first direct current bias voltage source connected in said circuit to apply a bias voltage of one polarity relative to a point of reference potential to said collector electrode to provide a bias voltage in the relatively non-conducting reverse direction between said collector and base electrodes, means providing a second direct-current bias voltage source connected in said circuit to apply a bias voltage of an opposite polarity relative to said point of reference potential to said base electrode to provide a bias voltage in the relatively non-conducting reverse direction between said emitter and base electrodes to provide a negative resistance characteristic over a portion of the operating range of the oscillator circuit, and a frequency determining circuit connected with one of said emitter and collector electrodes and operative to control the frequency of oscillation of said circuit.

---

2,769,907
SEMI-CONDUCTOR RELAXATION OSCILLATOR CIRCUITS
Robert D. Lohman, Princeton Junction, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application June 29, 1954, Serial No. 440,041
12 Claims. (Cl. 250—36)

1. In a relaxation oscillator circuit, the combination with a first semi-conductor device of one conductivity type having a first base, a first emitter and a first collector electrode, and a second semi-conductor device of an opposite conductivity type having a second base, a second emitter and a second collector electrode, of circuit means including a storage element coupling said first base electrode with said second collector electrode, means connecting said first emitter electrode with said second emitter electrode, and conductive circuit means for applying energizing potentials to said devices and for charging said storage element and operative to bias said first and second semi-conductor devices into a current conducting condition.

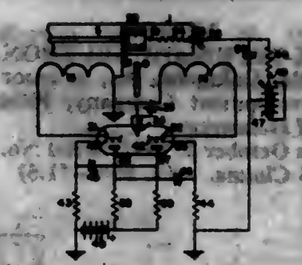
2,769,908
NEGATIVE IMPEDANCE TRANSISTOR CIRCUITS
Frank R. Stansel, Millburn, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application November 22, 1952, Serial No. 322,169
14 Claims. (Cl. 250—36)

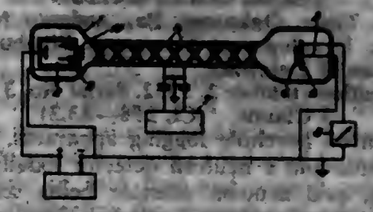
1. In combination, a transistor having emitter, collector, and base electrodes and a current amplification factor less



than unity, at least one source of direct voltage connected to supply operating potentials to said electrodes, a signal input path for said transistor coupled between said collector electrode and a first of the other of said electrodes, a signal output path for said transistor coupled between said collector electrode and the second of the other of said electrodes, said collector electrode being

common to said signal input and output paths, and means to produce a negative input impedance in said signal input path between said collector electrode and said first electrode which comprises a load resistance and a load capacity connected in parallel between said collector electrode and said second electrode in the portion of said signal output path not common to said signal input path.

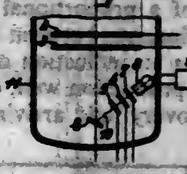
---



2,769,909
PULSE GENERATORS
Donald S. Rakemacher, Van Nuys, Calif., assignor to Stoddart Aircraft Radio Co., Inc., Los Angeles, Calif., a corporation of California
Application February 3, 1954, Serial No. 407,890
19 Claims. (Cl. 250—37)

1. An electrical pulse oscillator comprising a single movable plunger, a conductive sheath enclosing said plunger, said sheath electrically insulated from said plunger, means to electrically charge said plunger, other means to move said plunger to accept a charge from said means to charge, further means to discharge said plunger, means to move said plunger for the discharge thereof to said means to discharge, the energy of said discharge electrically exciting the recited structure of plunger and sheath at radio frequency by current flow over the outer surface of said plunger adjacent the inner surface of said sheath and still further means to move said plunger back to said charge means to again accept a charge.

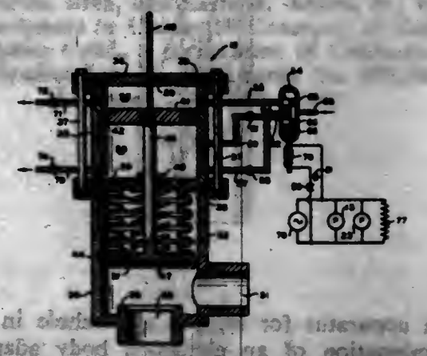
---



2,769,910
MASS SPECTROMETER
Gerrit Allard Klinge, Eindhoven, Netherlands, assignor to Hartford National Bank and Trust Company, Hartford, Conn., as trustee
Application September 17, 1953, Serial No. 380,813
Claims priority, application Netherlands September 20, 1952
5 Claims. (Cl. 250—41.9)

1. A mass spectrometer comprising an ion gun, a collecting electrode, a pair of conductors shaped in the form of a double helix disposed between said gun and said collecting electrode and coaxially arranged therewith, and means for applying an alternating voltage between said conductors, whereby ions of a given mass corresponding to a particular frequency of said alternating voltage are deflected away from the axis of the helix.

---



2,769,911
MASS SPECTROMETER FOR ANALYSING SUBSTANCES OR INDICATING A SMALL AMOUNT OF A DETERMINED SUBSTANCE
Nicolaas Warnoltz, Eindhoven, Netherlands, assignor to Hartford National Bank and Trust Company, Hartford, Conn., as trustee
Application April 23, 1953, Serial No. 350,577
Claims priority, application Netherlands May 6, 1952
8 Claims. (Cl. 250—41.9)

1. In a mass spectrometer having means producing a beam of ions, a collector in the path of said beam adapted to produce electrons when struck by said beam, electrostatic accelerating means disposed in the vicinity of said collector for accelerating said electrons, radiation detecting and counting means responsive to incident electrons for detecting the same and disposed to receive said accelerated electrons, and indicating means coupled to said detecting means.

---

2,769,912
SHUT-OFF VALVE
Dale E. Lupfer and Arthur B. Broerman, Bartlesville, Okla., assignors to Phillips Petroleum Company, a corporation of Delaware
Application April 12, 1954, Serial No. 422,586
12 Claims. (Cl. 250—41.9)

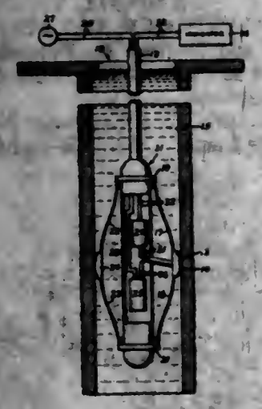
1. A shut-off valve comprising, in combination, a valve body including a valve seat, a valve head engageable with said valve seat, a piston chamber mounted adjacent said valve body, a piston positioned for movement in said chamber, said piston being secured to said valve head, first conduit means communicating with said chamber on the first side of said piston whereby said valve is closed when said piston is moved away from the opening of said first conduit means into said chamber, second conduit means communicating with said chamber at a position on the second side of said piston when said valve is in a fully open position, a source of fluid under pressure, and an electrically operated valve connecting said source of fluid to said second conduit means, when current is supplied to said electrically operated valve, said electrically operated valve connecting said source of fluid to said first conduit means in the absence of current being supplied to said electrically operated valve.

2,769,913

## DISPLACEMENT FLUID IN SECONDARY PETROLEUM RECOVERY

Roy P. Mennenguth, Houston, Tex., assignor to The Texas Company, New York, N. Y., a corporation of Delaware

No Drawing. Application December 23, 1952, Serial No. 327,689
6 Claims. (Cl. 250—43.5)



1. In the secondary recovery of petroleum from a subsurface, oil bearing formation by injecting a secondary oil displacing, recovery fluid into said formation at a plurality of injection points to promote flow of said oil toward at least one producing well, the improvement which comprises adding to the recovery fluid at at least one injection point a detectable amount of the beta-active, isotopic element $C^{14}$, adding to the recovery fluid supplied at other of said injection points tritium in a detectable amount, testing the fluids withdrawn from said producing well by means of a proportional radioactivity counter effective to discriminate between the electron energy of tritium and $C^{14}$ as an indication of the arrival of the recovery fluid in the production well, effective to establish the origin of the recovery fluid arriving at the production well.

2,769,914

## APPARATUS FOR LOGGING THE FLUORESCENCE AND PHOSPHORESCENCE OF EARTH FORMATIONS TRAVERSED BY A BOREHOLE

Clark Goodman, Boston, Mass., assignor to Schlumberger Well Surveying Corporation, Houston, Tex., a corporation of Delaware

Application November 8, 1951, Serial No. 255,482
5 Claims. (Cl. 250—71)

1. In apparatus for logging a borehole in the earth, the combination of an elongated body adapted to be moved through the borehole, a borehole wall engaging member, means connecting said wall engaging member with said body for support thereby and for urging one surface of said wall engaging member against the borehole wall, a natural source of radioactivity embedded in said surface and providing radiation that is readily absorbed by materials in the vicinity of said source, whereby when said surface is against the wall of the borehole, said radiations will excite light in a highly localized area of the material comprising the borehole wall in the vicinity of said source, a window in said surface in the vicinity of said source and adapted to be transparent to said light, photoelectric means in said wall engaging member and disposed to receive the excited light through said window from said localized area on the borehole wall, and means for exhibiting a function of the response of said photoelectric means to said light as said body is moved through the borehole.

2,769,915

## EPITHERMAL NEUTRON DETECTOR

Charles W. Tittle, Oakmont, Pa., assignor to Gulf Research & Development Company, Pittsburgh, Pa., a corporation of Delaware

Application October 2, 1952, Serial No. 312,680
3 Claims. (Cl. 250—71.5)

1. In an epithermal-neutron detecting device, a neutron-gamma reactive material that includes nuclei of an element having a resonance peak for such reaction with neutrons of epithermal energy selected from the group consisting of indium, silver, rhodium and gold, a gamma-ray-responsive scintillation phosphor adjacent said material, a photomultiplier tube optically coupled to the phosphor, and a gamma-ray shield surrounding the material, the phosphor, and the photomultiplier tube, to attenuate background gamma-rays.

2,769,916

## COINCIDENCE-TYPE SLOW NEUTRON DETECTOR

Charles W. Tittle, Oakmont, Pa., assignor to Gulf Research & Development Company, Pittsburgh, Pa., a corporation of Delaware

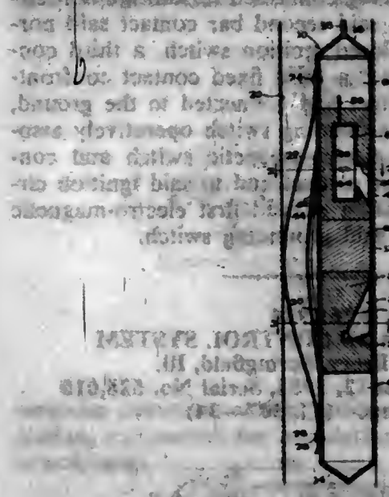
Application October 2, 1952, Serial No. 312,679
8 Claims. (Cl. 250—71.5)

1. In a neutron detecting apparatus, a neutron-gamma reactive substance, a pair of gamma-ray-responsive scintillation phosphors disposed on opposite sides of said substance, material opaque to scintillations disposed between the phosphors, a pair of photomultiplier tubes optically coupled individually to said pair of phosphors, and a coincidence circuit coupled to the outputs of said photomultiplier tubes.

2,769,917

WITHDRAWN

2,769,918

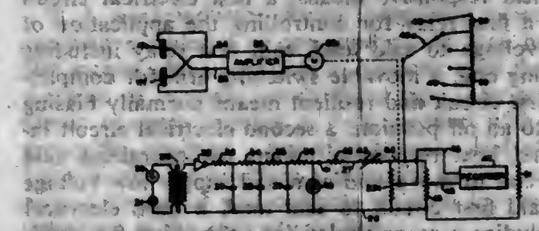


## EPITHERMAL NEUTRON LOGGING METHOD USING COLLIMATION

Charles W. Tittle, Oakmont, Pa., assignor to Gulf Research & Development Company, Pittsburgh, Pa., a corporation of Delaware

Application October 2, 1952, Serial No. 312,678
3 Claims. (Cl. 250—83.3)

1. In neutron borehole logging apparatus, a casing, a neutron source and a neutron detector axially spaced in such casing, said neutron detector being sensitive substantially solely to neutrons having energies of about 0.2 to about 200 electron volts, neutron-collimating means for directing neutrons emanating from said source through one side of the casing, and further neutron-collimating means for directing solely those neutrons entering the



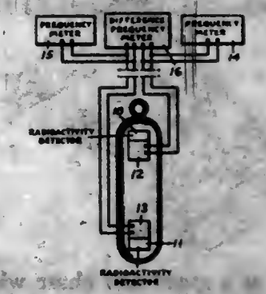
casing through said one side thereof to the neutron detector.

2,769,919

## RECORDER CIRCUIT

Francis W. Crawford, Idaho Falls, Idaho, assignor to Phillips Petroleum Company, a corporation of Delaware

Original application September 29, 1950, Serial No. 187,600, now Patent No. 2,724,307, dated November 22, 1955. Divided and this application May 28, 1953, Serial No. 358,107
11 Claims. (Cl. 250—83.3)



9. An electrical circuit for recording the differential intensity of two beams of radiation comprising, in combination, a recorder, a pair of radiation sensitive detectors, an amplifier, means connecting said detectors in opposition to the input terminals of said amplifier whereby the signal applied to said amplifier is representative of the difference in intensity of radiation impinging upon said pair of detectors, a servo-motor connected to the output terminals of said amplifier, a voltage source, a resistance of high ohmic value having one terminal thereof connected to the first output terminal of said voltage source whereby substantially a constant current flows through said resistance element, a first potentiometer having one end terminal thereof connected to the second terminal of said resistance element and having the second end terminal thereof connected to the second output terminal of said voltage source, a second potentiometer having one end terminal thereof connected to the second terminal of said resistance element and having the second end terminal thereof connected to the second output terminal of said voltage source, the contactors of said first and second potentiometers being connected to the respective terminals of the input circuit of said recorder, a variable resistance of low ohmic value as compared to the ohmic value of said first-mentioned resistance, said variable resistance being connected in shunt with the end terminals of said first and second potentiometers, and means connecting the contactor of said first potentiometer to said servo-motor whereby rotation of said motor varies the setting of the contactor of said first potentiometer in accordance with the difference in intensity of radiation impinging upon said pair of detectors, the setting of the contactor of said second potentiometer determining the zero level of signals fed to said recorder.

2,769,920

## RADIOACTIVITY RESPONSIVE SYSTEMS FOR USE IN BOREHOLES

Shelley Kramow, Fairfax County, Va., assignor to Schlumberger Well Surveying Corporation, Houston, Tex., a corporation of Delaware

Original application July 24, 1942, Serial No. 452,228, now Patent No. 2,590,874, dated April 1, 1952. Divided and this application February 27, 1952, Serial No. 273,751
13 Claims. (Cl. 250—83.6)

1. In a method of investigating radioactivity in a bore hole drilled into the earth, the steps of simultaneously lowering into the bore hole a plurality of longitudinally spaced apart radioactivity responsive devices having substantially the same radioactivity response characteristics and each manifesting its radioactivity response in the form of an electric signal, exposing said devices to radioactivity in the bore hole so as to cause them to respond significantly thereto, combining together the electric signals manifested by said devices as results of said responses and registering said combined signals in a mode exhibiting a function of a combination of the responses of said devices.

2,769,921

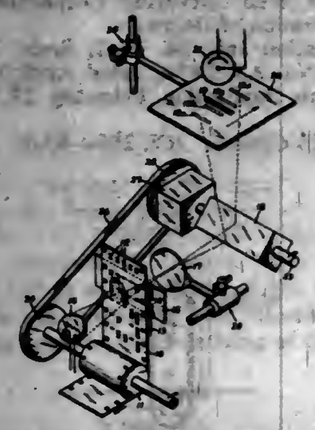
## PREVENTION OF WELL CASING CORROSION

Paul G. Nahin, Brea, and Earle R. Atkins, Jr., Whittier, Calif., assignors to Union Oil Company of California, Los Angeles, Calif., a corporation of California

Application July 31, 1952, Serial No. 301,901
4 Claims. (Cl. 250—106)

1. The method of preventing bacterially-induced corrosion of well casings which comprises traversing the cased-in well bore with a source of gamma radiation having a radiation intensity of at least about one curie per foot of source.

2,769,922



## TAPE READING MECHANISM

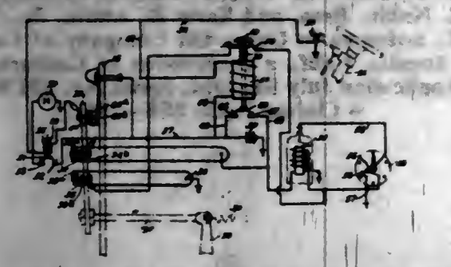
Walter E. Peery, Pottersville, N. J., assignor to Time, Incorporated, New York, N. Y., a corporation of New York

Application February 6, 1952, Serial No. 270,214
9 Claims. (Cl. 250—219)

7. Mechanism for converting into a time sequence of electric signals the intelligence distributed over the length

of each signal module in a plurality of modules disposed along a control member, said mechanism comprising, feed means for advancing said control member to pass said modules lengthwise through a zone representing the point of origin for images of modules therein, photoelectric means, rotatable light deflecting means disposed in an optical path between said zone and photoelectric means and adapted upon rotation to scan along the line of travel of said modules, drive means for rotating said

deflecting means at a speed and phase which synchronize the appearance of each module in said zone with deflection of the image thereof by said deflecting means towards said photoelectric means and in a direction productive of a sweep of the length of said image past said photoelectric means during said synchronous rotation, and optical means for limiting the subject seen by said photoelectric means at any instant of said sweep to an image portion having a fraction of the length of the whole swept image.



---

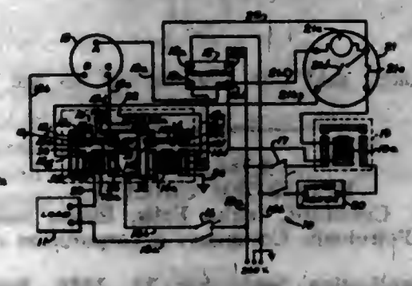
2,769,923

**AUTOMATIC IGNITION CONTROL SWITCH**

Paul J. Vesco, Lovelock, Nev.

Application November 5, 1954, Serial No. 467,110
1 Claim. (Cl. 290—38)

In an internal combustion engine, an ignition circuit embodying a battery, a coil, a distributor, and a ground, a normally open vacuum closed ignition switch in said circuit, a starter circuit including said battery, a starter motor in said starter circuit, a normally open manual switch, an electromagnetic switch interposed in said ignition circuit, shunting said normally open vacuum closed ignition switch, and connected between said starter circuit and said battery, an operating coil for said electromagnetic switch connected through said manual switch to said battery, a movable contact bar, a vacuum operator for moving said bar in one direction when the engine starts, a spring for moving said bar in the opposite direction when the engine stops, a contact carried by said bar connected to a second electro-magnetic switch interposed in said starter circuit and including a second operating coil, a stationary contact confronting and normally engaging said first named contact for normally closing a circuit from said battery to said second operating coil through said normally open manual switch, a second contact carried by said bar and conected to said battery, a second fixed contact connected to one side of said ignition circuit and confronting said second bar contact and normally disengaged therefrom, said second fixed contact being connected to said ignition circuit and forming with said second bar contact said normally open vacuum closed ignition switch, a third contact carried by said bar, a third fixed contact confronting said third bar contact and connected to the ground, and a normally open grounding switch operatively associated with said first electro-magnetic switch and connected to said third bar contact and to said ignition circuit, whereby energization of said first electro-magnetic switch will also close said grounding switch.



---

2,769,924

**DUAL VOLTAGE CONTROL SYSTEM**

Virgil R. Beery, Springfield, Ill.

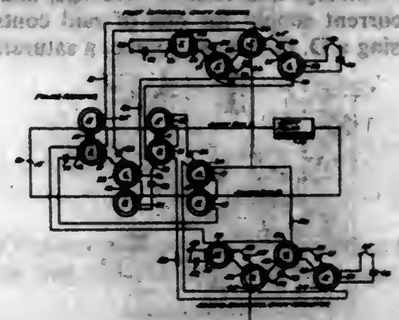
Application August 12, 1955, Serial No. 528,018
6 Claims. (Cl. 307—34)

6. An electrical circuit for controlling the application of relatively high and relatively low voltages to a load; comprising a source of high voltage; a source of low voltage; heat responsive means; a first electrical circuit including a first relay for controlling the application of said low voltage to said load, said first relay including an operating coil, a movable switching arm for completing said first circuit and resilient means normally biasing said arm to an off position; a second electrical circuit including said heat responsive means for energizing said operating coil to move said arm and supply low voltage through said first circuit to said load, a third electrical circuit including a second relay for controlling the application of said high voltage to said load, said second relay including a solenoid, a movable switching arm for completing said third circuit, and resilient means normally biasing the last mentioned arm to a low voltage position; a fourth electrical circuit including said heat responsive means for energizing said solenoid to move said last mentioned arm and apply high voltage through said third circuit to said load; and interlocking means associated with said first and second relays, said interlocking means including a switch connected in said second electrical circuit and operable by said last-mentioned arm upon energization of said solenoid, thereby to deenergize said operating coil and to disconnect said low voltage from said load in time correlation with the application of said high voltage to said load.

---

2,769,925

**MAGNETIC STEPPING SWITCHES**



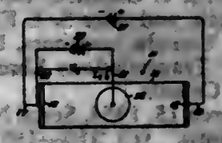
Norman B. Saunders, Weston, Mass., assignor to American Machine & Foundry Company, a corporation of New Jersey

Application March 2, 1953, Serial No. 339,883
20 Claims. (Cl. 307—88)

20. A magnetic stepping switch comprising a plurality of magnetic cores having output and shift windings thereon, a shift pulse generator connected to said shift windings for shifting said cores in one direction, said cores having input windings thereon for receiving pulses for shifting said cores in the opposite direction, a plurality of electrical loads, at least one of said loads comprising a

plurality of serially connected shift windings for shifting a second plurality of magnetic cores in one direction, said second named cores having input windings thereon for

receiving pulses for shifting said cores in the opposite direction, and means for connecting said output windings to said loads.



---

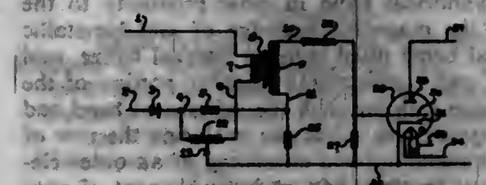
2,769,926

**NON-LINEAR RESISTANCE DEVICE**

Israel A. Lesk, Syracuse, N. Y., assignor to General Electric Company, a corporation of New York

Application March 9, 1953, Serial No. 341,164
9 Claims. (Cl. 307—88.5)

9. A semiconductor device comprising a bar of semiconductive material of one conductivity type having first and second ohmic contacts at opposite ends thereof, and a region of opposite conductivity type intermediate said ohmic contacts forming a P-N junction with said bar, means for applying a potential between said ohmic contacts, means for applying a potential to said region with respect to one of said contacts which is intermediate the potentials at the ends of said bar.



---

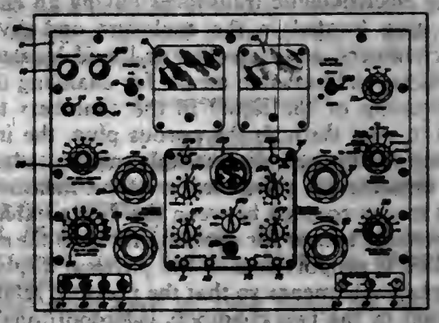
2,769,927

**APPARATUS FOR GENERATING A PULSE VOLTAGE AND BIAS**

Rufus L. Briggs, Melrose, Mass., assignor to Ira A. Campbell, New York, N. Y.

Application October 10, 1951, Serial No. 250,763
7 Claims. (Cl. 307—106)

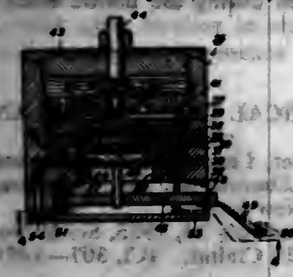
7. The combination of a transformer having a high ratio of turns between its primary and secondary windings, a capacitor whose charging current is capable of sufficiently exciting the transformer, means connecting the primary of the transformer and the capacitor in series across a rectified A. C. power source, and the secondary of the transformer being in an output circuit, in which by sending through the primary of said transformer a current from the rectified A. C. power source for the purpose of charging the capacitor there is produced a voltage pulse in the secondary of the transformer, and means to obtain a variation in the time relationship between the generation of the pulse and some given reference time such as the occurrence of zero voltage in a phase of said rectified A. C. power source from which flows the current charging the said capacitor, said latter means consisting of a variable resistor connected in parallel with said capacitor and causing said capacitor to be discharged during the period when said current is not flowing.



---

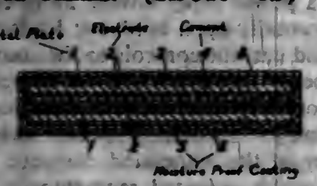
2,769,928

**ELECTRICAL CALIBRATING AND TEST APPARATUS**



Henry H. Ensker, Lincoln Park, N. J., assignor to Radio Frequency Laboratories, Inc., Boonton, N. J., a corporation of New Jersey

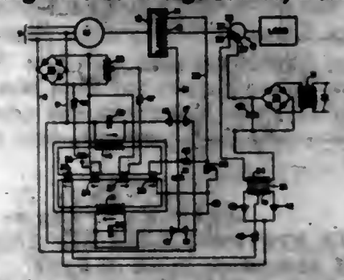
Application July 14, 1955, Serial No. 521,948
13 Claims. (Cl. 307—149)



12. In calibrating apparatus of the class adapted to be energized by a source of alternating current energy to provide selected magnitudes of A.-C. and D.-C. voltages and currents to a test device connected to the apparatus output terminals, the combination of a multi-contact rotary output selector switch manually settable to condition the apparatus circuitry for delivering either A.-C. or D.-C. voltages and currents to the test device; a multi-point rotary range-selector switch manually settable to condition the circuitry of the apparatus for the current or voltage to the test device; a multi-point rotary voltage selector switch manually settable to condition the apparatus circuitry a selected range of current and voltage magnitudes to the test device, an adjustable voltage control and adjustable current control, each such control having a movable member settable to a zero voltage output position; a power relay having an operating coil and two sets of normally-open contacts; leads connecting the said voltage and current controls to the source of alternating current energy through a first set of power relay contacts; a first normally-closed switch actuated momentarily to open position as the output selector switch is set from one to another of the associated contacts; a second normally-closed switch actuated momentarily to open position as the range-selector switch is set from one to another of the associated contacts; a third normally-closed switch actuated momentarily to open position as the voltage selector switch is set from one to another of the associated contacts; a source of energizing voltage; leads connecting the said three normally-closed switches in series between one side of the power relay operating coil and one side of said energizing voltage; a first normally-open switch actuated to closed position when the adjustable member of the voltage control is set to the zero voltage output position; a second normally-open switch actuated to closed position when the adjustable member of the current control is set to the zero voltage output position; leads connecting the said two normally-open switches in series between the other side of the power relay operating coil and the other side of the said energizing voltage; and leads connecting the second set of said relay contacts between the said other side of the power relay operating coil and the said other side of the energizing voltage.

2,769,929
ELECTROKINETIC TRANSDUCERS
Edward V. Hardway, Jr., Richmond, Va., assignor, by mesne assignments, to Consolidated Electrodynamics Corporation, Pasadena, Calif.
Application April 15, 1953, Serial No. 348,975
4 Claims. (Cl. 310—2)

1. In an electrokinetic transducer having an enclosure, a porous plug located in the enclosure and dividing it into two chambers, an electrokinetic liquid located in the two chambers, and movable means for changing the pressure relationship of the liquid in the chambers to cause the liquid to pass through the porous plug, the improvement which comprises displaceable means adapted to move in response to phenomenon to be measured, and compliant means coupled between the displaceable means and the movable means for applying force to the movable means which is proportional to the physical displacement of the displaceable means so that the pressure relationship of the liquid in the two chambers is proportional to the physical displacement of the displaceable means, with the combined stiffness of the movable means and of the compliant means being less than the resistance of the porous plug to the passage of the electrokinetic liquid to cause movement of the liquid through the porous plug to be small with respect to the movement of the displaceable means, so that the potential which is caused by movement of the liquid through the porous plug is proportional to the physical displacement of said displaceable means.



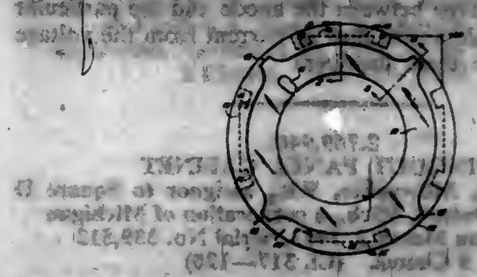
2,769,930
PIEZO-ELECTRIC DEVICES
Robert Heinrich Sturm, Enfield, England
Application October 13, 1952, Serial No. 314,563
Claims priority, application Great Britain October 15, 1951
12 Claims. (Cl. 310—8.9)

1. The method of producing a moisture proof piezo-electric transducer assembly comprising a pair of plates of piezo-electric material joined together in face to face relation which comprises the steps of applying an electrode to one face of each plate, then applying a coating of moisture-proofing material to all surfaces of said electroded plates, and then cementing the moisture proofed electroded faces of said plates together.

2,769,931
MAGNETIC AMPLIFIER CONTROL DEVICE FOR AN ELECTROMAGNETIC CLUTCH
George W. Allen, Flanders, N. J., assignor to The Singer Manufacturing Company, Elizabeth, N. J., a corporation of New Jersey
Application March 16, 1953, Serial No. 342,663
8 Claims. (Cl. 310—95)

1. In a motor speed control system, an electric motor, and electric slip clutch driven by said motor, a variable load driven by said clutch, an excitation winding for said clutch, means for controlling the current supplied to the excitation winding including a magnetic amplifier having load windings and control windings, and a speed-responsive current supply for one of said control windings comprising a D. C. voltage source, a saturating transformer, a circuit interrupter driven by said clutch for supplying current from the D. C. voltage source to the primary of said transformer at a pulse repetition rate determined by the output speed of said clutch and of a value sufficient to saturate the transformer, and a rectifier connected between the secondary of the saturating transformer and the control winding.

2,769,932
MAGNETIC COUPLINGS
Igor V. Zozulin, George J. Okulitch, George M. Volkoff, Vladimir J. Okulitch, and Alec S. J. Elliott, Vancouver, British Columbia, Canada, assignors, by mesne assignments, to Tornaag Transmissions Limited, Vancouver, British Columbia, Canada
Application March 15, 1954, Serial No. 416,324
5 Claims. (Cl. 310—105)

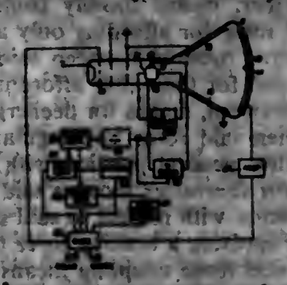


1. A slip torque coupling comprising a unit having a drive rotor and a driven rotor, said drive rotor having a hub projecting to one side of said unit and adapted to be fitted to the shaft of a motor, a hub sleeve journalled on said hub, an annular rim supported in widely spaced relation from said hub sleeve, said rim being fitted with a row of circumferentially spaced magnets, a flange supported from the outer end of said hub, said flange having a bimetallic cylindrical band in close proximity to the pole pieces of the magnets, one edge of said bimetallic cylindrical band being fitted with an internal flange, said internal flange and a substantially similar portion of the first named flange forming with the cylindrical band and the magnet carrying rim a housing enclosing the row of magnets, said bimetallic band consisting of an outer element of magnetic material and an inner element of non-magnetic material, said inner element being attached to the outer element by a zig zag row of rivets, all of said rivets being a substantial distance from the edges of the band.

2,769,933
STATOR CONSTRUCTION
Edwin C. Ballman, St. Louis, Mo., assignor to Ballman Engineering Company, St. Louis, Mo., a corporation of Missouri
Application September 4, 1953, Serial No. 378,543
4 Claims. (Cl. 310—217)

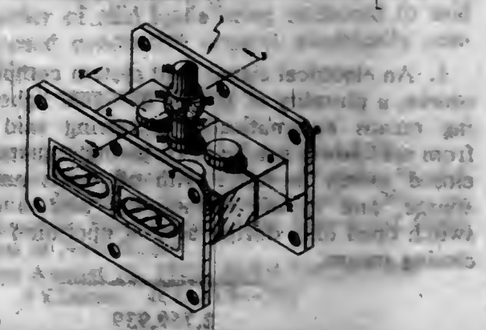
1. A substantially cylindrical core having a series of axially extending slots circumferentially spaced about 45°

and with generally radial side walls constituting the side walls of dovetail anchors, the alternate dovetails being



truncated to provide a space to accommodate a cylindrical segment of cast material connected by a pair of slots.

2,769,934
ROTOR CONSTRUCTION, PARTICULARLY FOR USE IN ELECTRIC MOTORS
Thomas W. Stone and James W. Tweedy, Owosso, Mich., assignors to Redmond Company, Inc., Owosso, Mich., a corporation of Michigan
Application August 16, 1955, Serial No. 528,714
16 Claims. (Cl. 310—261)

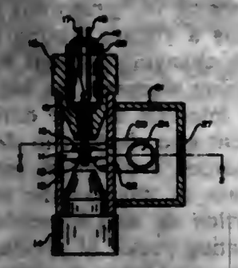


1. In combination, a shaft, a member on said shaft and having a portion radially spaced from said shaft to define a space therebetween having an axially outwardly oriented opening, and an element slidable over said shaft and having a radially collapsible part telescopable within the space between said shaft and said member portion via said opening, the normal outer diameter of said element part being greater than the inner diameter of said member portion, whereby telescoping of said element within said member causes said element to contract radially and grip said shaft and causes said member to be connected to said element, said member comprising an inner wall substantially perpendicular to and slidable over said shaft, a side wall of appreciable length extending axially outwardly from said inner wall substantially parallel to and spaced from said shaft to define said member portion, and an outer wall flaring radially outwardly from the outer end of said side wall, said outer wall permitting said member to function as an oil slinger.

2,769,935
ELECTRONIC DIGITAL COMPUTERS
Frederic C. Williams, Timperley, and Tom Kilburn, Northfield, Dewsbury, England, assignors to National Research Development Corporation, London, England
Application May 31, 1950, Serial No. 165,262
Claims priority, application Great Britain June 7, 1949
3 Claims. (Cl. 315—20)

1. In a digital computer, a storage device comprising an electric charge-retaining element, electron gun means including control means directing a beam of charged particles on said element to develop electrostatic charges on said element, deflecting means causing said beam to scan said element, means for generating and applying to said deflecting means a voltage having a waveform including progressively changing portions separated by portions of constant value whereby the beam is caused to pause for recurrent intervals of time during said scan, a pick-up plate adjacent said element to detect changes in said electrostatic charges, a dot pulse generator coupled to said control means to increase the intensity of said beam during a portion of said intervals, a dash pulse generator for generating pulses of greater duration than said dot pulses, means coupled to said control means and responsive to certain detections of said pick-up plate to extend the effect of any of said dot pulses to maintain the beam at said increased intensity for the period of a dash pulse in order to regenerate said charges, and a further pulse generator coupled to said control means for reducing the intensity of said beam during a predetermined portion of each of said intervals of time.

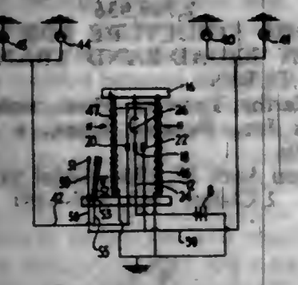
2,769,936
ELECTRODE STRUCTURE FOR MULTIPLE SECTION BROAD-BAND TRANSMIT RECEIVE TUBES
Henry J. McCarthy, Danvers, Mass., assignor to Bomac Laboratories Inc., Beverly, Mass., a corporation of Massachusetts
Application April 15, 1954, Serial No. 423,498
1 Claim. (Cl. 315—39)



A broad-band transmit-receive tube for use in a balanced duplexer system, said tube comprising a plurality of mutually parallel wave guide envelope sections of rectangular cross section having broad and narrow walls, said wave guide sections being joined together with each section sharing a common narrow wall throughout its length with an adjacent section, said common narrow wall having an indentation at an intermediate point of one edge thereof defining with the upper broad walls a passage for a gaseous atmosphere introduced into said wave guide sections, a laterally glass-sheathed and bare-ended ignitor electrode extending into said passage with the bare-end of said electrode spaced from bottom edge of said indentation to define therewith a discharge gap.

2,769,937
TUNABLE STABILIZED MAGNETRON
Franklin Hutchinson, New Haven, Conn., and Melvin A. Herlin, Cambridge, Mass., assignors to the United States of America as represented by the Secretary of the Navy
Application May 10, 1946, Serial No. 668,782
10 Claims. (Cl. 315—39.77)

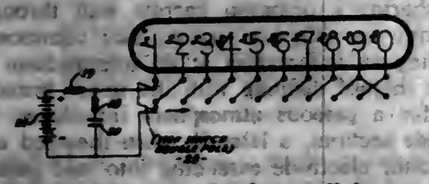
8. A combined tuning, frequency stabilizing and output coupling device adapted for external attachment to a plural cavity magnetron, said device including a cavity resonator having an input coupling aperture adapted to electrically couple said resonator to the magnetron, power output coupling means adapted to couple radio frequency energy out of said resonator, said power output coupling



means being a substantially circular aperture in the wall of said cavity resonator opposite the input coupling aper-

ture, and tuning means coupled to said resonator for varying the resonant frequency of said resonator.

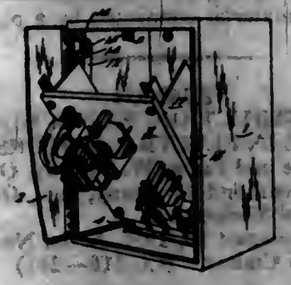
---



2,769,938
**MEANS FOR FLASHING SIGNAL LIGHTS**
Jacob L. Pauly, Inglewood, Calif., assignor to Theodore W. Hallerberg, Los Angeles, Calif.
Application March 11, 1955, Serial No. 493,719
3 Claims. (Cl. 315—210)

1. An electrical signal light system comprising a power source, a plurality of groups of signal lights, circuit closing means automatically energizing said signal lights from said power source in recurring sequence, a normally closed switch in series with all lights and said power source, and means maintaining said normally closed switch open only during normal operation of said circuit closing means.

---



2,769,939
**READ-OUT TUBE CIRCUIT**
Charles R. Williams, Hawthorne, Calif., assignor to Northrop Aircraft, Inc., Hawthorne, Calif., a corporation of California
Application June 12, 1950, Serial No. 167,571
1 Claim. (Cl. 315—233)

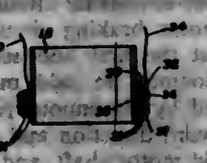
In combination, a tube having a light transmitting portion, an ionizable gas disposed in the tube at a pressure for producing a glow discharge upon ionization, a plurality of cathodes disposed within the tube, the cathodes being shaped to represent different symbols and being superimposed in substantially parallel relationship to one another adjacent to the light transmitting portion of the tube, an anode disposed in the tube, a plurality of switches each associated with a different cathode, a source of direct voltage, a resistance, and a capacitance, the voltage source, the resistance and the switches being connected in series with the capacitance to provide for a charging of the capacitance upon the closure of one of the switches, the voltage source, the resistance and the switches also being connected in series with the anode and cathodes to provide for an initial flow of current from the voltage source through the anode and a particular one of the cathodes dependent upon the operation of the associated switches, the capacitance being connected across the anode and cathodes to provide at least one discharge between the anode and the particular cathode upon the initial flow of current from the voltage source through these members.

---

2,769,940
**SWINGOUT PANEL CABINET**
Dorn L. Pettit, Milwaukee, Wis., assignor to Square D Company, Detroit, Mich., a corporation of Michigan
Application March 2, 1953, Serial No. 339,512
9 Claims. (Cl. 317—120)

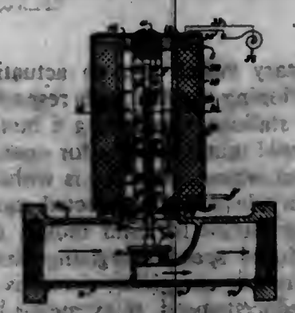
1. In a panel cabinet, an enclosure having an openable door, a panel within said enclosure, circuit controlling means mounted on said panel and including manipulable elements at the back of the panel, means rigidly mounting said panel within the enclosure, means providing a rotatable axis transversely of said panel intermediate the top and bottom thereof, and means for automatically moving said axis providing means forwardly of the normal plane of the panel when the mounting means is released whereby to provide for rotation of said panel adjacent to the entrance to the enclosure.

---



2,769,941
**ROTARY COAXIAL SWITCH ACTUATING MECHANISM**
William R. Elliott, Mayfield Heights, Ohio, assignor to Thompson Products, Inc., Cleveland, Ohio, a corporation of Ohio
Application December 5, 1951, Serial No. 259,979
12 Claims. (Cl. 317—157)

1. Indexing mechanism for selectively positioning a rotor with respect to a plurality of surrounding stations comprising a rotatable drive member, means for actuating said drive member, means loosely coupling said drive member to said rotor for affording only a predetermined amount of relative rotation between said drive member and said rotor and for thereafter affording a direct positive drive therebetween, means for deenergizing said actuating means when said rotor has angularly moved to a preselected relative general position with respect to said station, means for thereafter moving said rotor to a precise relative position with respect to said station, and separate means for applying a braking force to said rotatable drive member, said loose coupling means affording sufficient relative rotation between said braking means and said rotor to accommodate positioning of said rotor independent of the action of said braking means.



2,769,942
**VOICE COIL FOR LOUD SPEAKERS**
Joseph A. Hanson, Weymouth, Mass., assignor of one-half to Fredbal A. Hanson, Weymouth, Mass.
Application November 26, 1954, Serial No. 471,282
2 Claims. (Cl. 317—158)

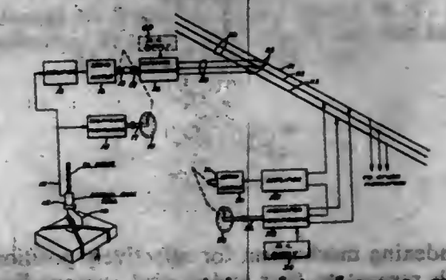
1. A voice coil comprising a non-magnetic form having a split therein extending the length thereof, and a coil winding embodying wire extending around said form in two layers, said coil winding having a free end extending from an inner said layer and another free end extending from the second of said layers, a separate wire, providing a third layer, outside said second layer embodying a free end extending between two portions of said form opposite said split and beyond, and electricity conducting means uniting both said latter free ends, said wire forming said three layers being substantially circular in cross section, said separate wire lying partly in the dips between two portions of wire that are alongside of and in contact with each other and that form said first two layers.

---

2,769,943
**ELECTROMAGNETIC CONTROL DEVICE**
Russell B. Matthews, Milwaukee, Wis., assignor to Milwaukee Gas Specialty Company, Milwaukee, Wis., a corporation of Wisconsin
Application April 28, 1953, Serial No. 349,667
12 Claims. (Cl. 317—168)

1. In an electromagnetic control device: annular magnetic field producing means; an elongated magnetically permeable core extending coaxially within said field producing means and providing an inner flux path therethrough; a magnetically permeable frame with respect to which said annular field producing means is fixed, said frame being connected to spaced portions of said core in flux conducting relation thereto and providing an outer flux path extending about the exterior of said annular field producing means, said core and frame forming a closed flux path; a magnetically permeable sleeve connected to said frame in flux conducting relation thereto and coaxially surrounding said core in spaced relationship to provide an annular air gap between said core and sleeve; flux diverting means for selectively shunting flux established by said field producing means radially across said annular air gap; and movable field producing means normally disposed in a predetermined position in said air gap, the fields of said fixed and movable field producing means being mutually repellent when said flux is shunted across said air gap, to thereby cause movement of said movable field producing means away from its normal position.

2,769,944
**CAPACITOR**
Sidney J. Stein, Philadelphia, and Alexander L. Pugh, Jr., Bala-Cynwyd, Pa., assignors to International Resistance Company, Philadelphia, Pa., a corporation of Delaware
Application August 18, 1953, Serial No. 375,004
4 Claims. (Cl. 317—242)

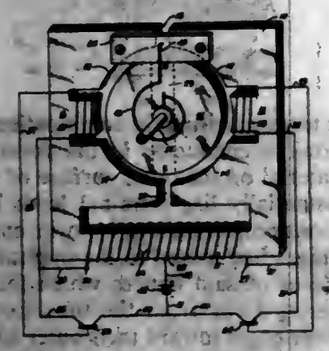


1. A capacitor comprising, in combination, a tube of dielectric material, a conductor in the form of a film of conductive material on the outer surface of said tube, and a pair of substantially like terminal leads having axially spaced extensions projecting into opposite ends of said tube and lateral flanges juxtaposed to the opposite ends of said tube, the surfaces of said flanges which face the ends of said tube tapering away from the tube from a point adjacent their inner edges toward their outer edge.

4. A capacitor comprising in combination a tube of dielectric material, a conductor in the form of a film of conductive material on the outer surface of said tube and extending from end-to-end thereof, a pair of substantially like terminal leads having axially spaced extensions projecting into opposite ends of said tube and lateral flanges juxtaposed to the opposite ends of said tube, and dielectric cement interposed between the flange of one of said leads and the adjacent end of the tube anchoring said flange to the tube and insulating said flange from said film, the flange of the other of said leads being anchored to said tube by interposed conductive cement electrically connected to said film.

---

2,769,945
**ELECTRIC CRANE SCALE REPEATER**
Leonard R. Stone, Cleveland, Robert G. Watson, Euclid, and Richard J. Carleton, Jr., Chagrin Falls, Ohio, assignors to Republic Steel Corporation, Cleveland, Ohio, a corporation of New Jersey
Application August 12, 1952, Serial No. 304,032
4 Claims. (Cl. 318—29)



2. Apparatus for transmitting data from a movable carrier to a fixed position comprising three conductor rails and three movable contactors on the carrier engaged with the rails, a Wheatstone bridge follow-up system including a potentiometer on the carrier connected to the movable contactors and a potentiometer and servomotor connected to the rails at the fixed position, a first electrical supply for the follow-up system connected across the potentiometer on the carrier and a second electrical supply for the follow-up system connected across the potentiometer at the fixed position and in opposite polarity to the electrical supply on the carrier.

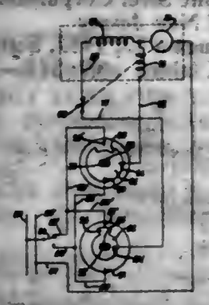
---

2,769,946
**OSCILLATING COMMUTATORLESS DIRECT CURRENT MOTOR**
Harrison D. Bradford, Rye, N. Y.
Application February 16, 1955, Serial No. 488,525
14 Claims. (Cl. 318—128)

1. An oscillating commutatorless D. C. motor comprising, an electromagnetic field structure, a rotor com-

prising a permanently magnetized bar mounted for rotation with respect to said field structure, at least one driving winding on said field structure, at least one control winding on said field structure, at least one transistor, means connecting each said transistor to one of said control windings to bias said transistor to conduction when said rotor rotates, means connected to said transistor and said

driving winding to produce a flow of current in said driving windings when said transistor is conductive and means to urge said rotor to a normal position with respect to said field structure and to resist movement from said normal position, said means serving to limit the movement of said rotor under urge of said driving winding to thereby cause said rotor to oscillate about said normal position under control of said windings and said transistors.



---

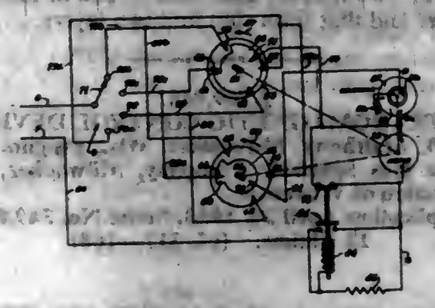
2,769,947

**CONTROL CIRCUIT AND ACTUATING MECHANISM FOR A COAXIAL SWITCH**

William R. Elliott, Bellevue, Wash., assignor to Thompson Products, Inc., Cleveland, Ohio, a corporation of Ohio

Application January 26, 1953, Serial No. 333,106
9 Claims. (Cl. 318—267)

6. Indexing mechanism for selectively positioning a rotor with respect to first and second surrounding stations of a coaxial switch, comprising a rotor shaft in driving connection with said rotor, a motor shaft in driving connection with said rotor shaft, a motor in driving connection with said motor shaft, indexing switch means including an indexing member on said rotor shaft and rotatable therewith and a pair of arcuately spaced stationary indexing contacts disposed about said rotor shaft and cooperating with said indexing member, said indexing member having a non-conducting portion for successively isolating said first and second stationary contacts as said rotor shaft is rotated, braking switch means including a braking member on said rotor shaft and rotatable therewith and first and second braking contacts disposed arcuately about said rotor shaft and cooperating with said braking member, said braking member being operative to successively make contact with said first and second contacts as said rotor shaft is rotated, first and second motor energizing circuits including respectively said first and second indexing contacts and said indexing member for energizing said motor to drive said rotor in the forward direction, first and second motor braking circuits including respectively said first and second braking contacts and said braking member for applying a braking force to said motor shaft, the respective stationary indexing and braking contacts being arranged with respect to said rotor shaft to contemporaneously deenergize the selected motor-energizing circuit and to energize the corresponding motor braking circuit to selectively position the rotor at the first and second stations, switch means having contacts in said motor braking circuits maintained closed by continuous rotation of said motor shaft in the forward direction and opening upon reverse movement of said motor shaft, and selector means selectively accommodating energization of said first motor energizing and motor braking circuits and said second motor energizing and motor braking circuits.



---

2,769,948

**CONTROL CIRCUIT AND ACTUATING MECHANISM FOR A COAXIAL SWITCH**

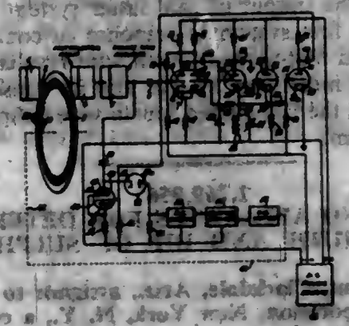
William R. Elliott, Mayfield Heights, Ohio, assignor to Thompson Products, Inc., Cleveland, Ohio, a corporation of Ohio

Application January 27, 1953, Serial No. 333,482
15 Claims. (Cl. 318—275)

8. In the rotary switch art, an actuating system for selectively positioning a rotor with respect to a plurality of surrounding stations, comprising a motor, an energizing circuit for said motor, means for opening said motor energizing circuit when said rotor is within a preselected angular range in advance of a selected station, a reduced speed energizing circuit for said motor, and means for closing said reduced speed energizing circuit when said first-mentioned motor energizing circuit is opened to run said motor at reduced speed, relay means in said reduced speed energizing circuit for actuation upon opening of said reduced speed energizing circuit, a dynamic braking circuit connected across said motor and controlled by said relay means, means for opening said reduced speed energizing circuit when said rotor is in proximity to said selected station to actuate said relay means and thus close said dynamic braking circuit to stop the motor, a resistor in said first-mentioned motor energizing circuit, and short circuit conductor means shunting said resistor, said relay means controlling said short circuit conductor means and being actuated by closure of said first-mentioned motor energizing circuit to close said short circuit conductor means.

---

2,769,949



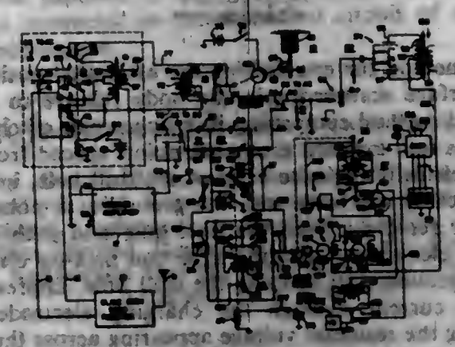
**METHOD AND APPARATUS FOR MOTOR SPEED REGULATION**

Jerry L. Stratton, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York

Application March 23, 1954, Serial No. 418,111
5 Claims. (Cl. 318—312)

1. A speed regulating system for a D. C. motor comprising an intermittently slotted scanning disk adapted to be driven by said motor, a light source adapted to pass light rays through the slots in said scanning disk, a photoelectric pickup device positioned to receive light rays from said light source through said slots and adapted to generate a voltage when said light rays are interrupted, means to amplify said voltage, an oscillating circuit adapted to be energized by said voltage, differentiating means to provide a voltage spike at the end of each cycle of said oscillating circuit, means to apply said voltage

spike to the grid of a thyratron type tube, means to apply the amplified voltage from the photoelectric pickup to the plate of said thyratron type tube whereby when the motor varies from its normal speed a differential current is produced in said thyratron tube, and means to utilize said differential current to control the voltage in the armature of said motor and return its speed to normal.



---

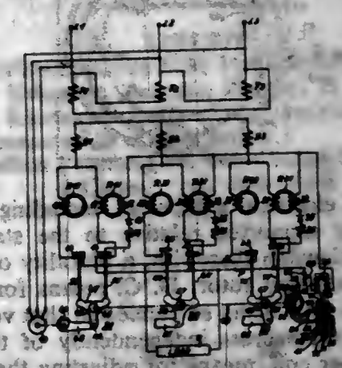
2,769,950

**AUTOMATIC PILOTS**

Willis H. Gille, St. Paul, Minn., assignor to Minneapolis-Honeywell Regulator Company, Minneapolis, Minn., a corporation of Delaware

Application April 12, 1952, Serial No. 281,964
6 Claims. (Cl. 318—489)

4. Control apparatus for an aircraft having a control surface for controlling its position about an axis thereof, said apparatus comprising: position responsive means for deriving a first control signal proportional to change in position of said aircraft from a predetermined datum; a servomotor adapted to control the positioning of said surface; operating means including an amplifier reversibly controlling said servomotor; a variable magnitude direct voltage source having a pair of output terminals and adjusted from said servomotor; a first condenser having a low impedance and a first and second resistor all connected in series in the order stated and the free end of the condenser and second resistor connected to said voltage source output terminals; a second condenser having a high impedance connected across said first condenser and first resistor whereby upon continuous adjustment of said direct voltage source a second control signal having components proportional to the rate of operation of said servomotor is provided across said second resistance; and means for applying both first and second control signals to said amplifier.



---

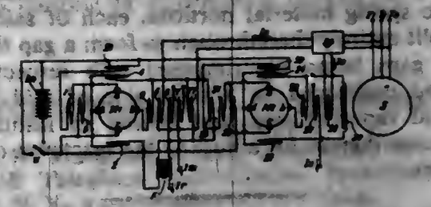
2,769,951

**MEASURING AND REGULATING APPARATUS FOR ELECTRIC CONTACT CONVERTERS**

Hans-Joachim Klaiber-gen, Berlin-Siemensstadt, Germany, assignor to Siemens-Schuckertwerke Aktiengesellschaft, Berlin-Siemensstadt, Germany, a corporation of Germany

Application December 21, 1951, Serial No. 262,855
Claims priority, application Germany January 11, 1951
3 Claims. (Cl. 321—45)

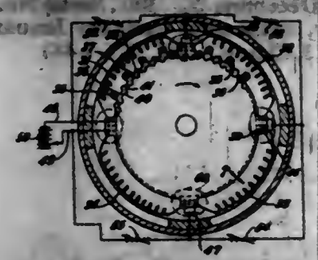
1. In a multi-phase commutating contact rectifier, the combination comprising a saturable switching reactor in each phase of the rectifier, a periodically opening commutation switch series-connected with said reactor, said switch comprising a pair of fixed contacts and a movable contact-bridging member, regulating means for controlling the commutation overlap of said commutation switches, said regulating means having an electro-responsive control coil, a control circuit having branches connected sequentially through the bridging member and a fixed contact of respective ones of said commutation switches, said control circuit comprising in each of said branches an auxiliary winding on the pertaining one of said reactors, and diode rectifier means series-connected with said control coil in said circuit.



---

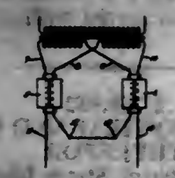
2,769,952

**EXCITATION SYSTEM AND CONTROL THEREFOR**



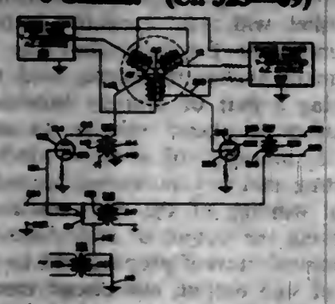
Joseph M. Pestarini, Staten Island, N. Y.

Application June 30, 1953, Serial No. 365,169
10 Claims. (Cl. 322—24)



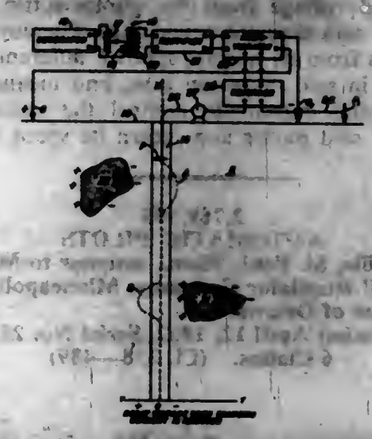
1. An excitation system for an electrical machine having an excitation winding, comprising a main exciter metadyne having a pair of primary brushes, a pair of secondary brushes displaced from said primary brushes and providing an output excitation current, and a plurality of control windings, circuit means connecting said secondary brushes with said excitation winding, and a pilot exciter metadyne for controlling the output current of said main exciter metadyne, said pilot exciter metadyne having a pair of primary brushes, a pair of secondary brushes displaced relative to said primary brushes, and a plurality of control windings, circuit means connecting said last mentioned secondary brushes to one control winding of the main exciter metadyne, means for sensing the output of said electrical machine to provide a control current proportional to an electrical characteristic of said output, and circuit means connecting said sensing means and one of the control windings of said pilot exciter metadyne.

2,769,953
**FIELD COIL BALANCING ARRANGEMENT**
Clarence F. Schwan, Cleveland, Ohio, assignor to The Ohio Crankshaft Company, Cleveland, Ohio, a corporation of Ohio
Application July 27, 1951, Serial No. 238,077
14 Claims. (Cl. 322—58)



1. Rotating electrical equipment, including a stator, a rotor rotatably supported relative to the stator and in operative relationship therewith, a plurality of field coils positioned about said rotor, D. C. means for energizing said coils, said coils being so connected that voltages may be developed thereacross independently of the voltages across any other coil, means for adjusting the energizing current in each field coil relative to the other field coil or coils and other means for flowing an alternating current in said coils superimposed on the D. C. current of a magnitude and phase such as to offset the tendency of the flux of any one coil to vary due to dynamic unbalance of the rotor.

2,769,954
**REACTORS AND REACTOR CONNECTIONS**
Thomas M. Evans, Pittsfield, Mass., assignor to General Electric Company, a corporation of New York
Application March 9, 1953, Serial No. 341,095
6 Claims. (Cl. 323—61)

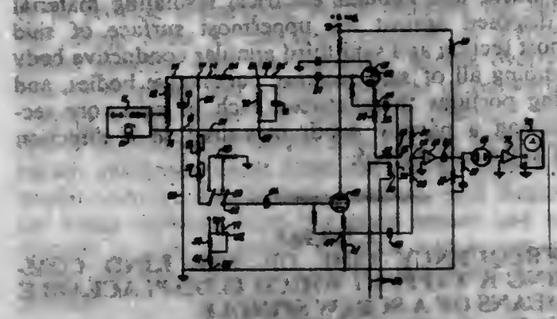


1. A laminated reactor core comprising an insulating tube snugly surrounded by a plurality of annular metallic magnetic spring material portions, each of said portions being split entirely therethrough to form a gap therein, all of said gaps being superimposed with respect to each other and positioned on a same side of said insulating tube, said superimposed gaps having an insulating material wedge therein for adjusting the reactance of said reactor core.

2,769,955
**THERMAL TIME DELAY CIRCUIT**
John Jarvis, Dumont, N. J., assignor to Bendix Aviation Corporation, Teterboro, N. J., a corporation of Delaware
Application December 4, 1952, Serial No. 324,000
6 Claims. (Cl. 323—69)

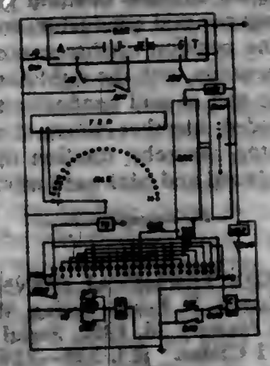
1. An electrical control device comprising a heating system including a normally balanced three-phase, four-wire resistive network, a three-phase power source for said network, a source of control energy for said fourth wire, whereby control energy supplied to said fourth wire unbalances said resistive network resulting in a heating of selected resistances, a system in heat exchange relationship with said heating system including a second normally balanced three-phase, four-wire resistive network, and a three-phase power source for said network, the fourth wire defining the output of said latter system whereby a heating of the first system in response to control energy supplied to said first-named fourth wire results in a heating of the last-mentioned system and its consequent unbalance so that the last-named fourth wire defines the output of the system.

2,769,956
**METHOD AND APPARATUS FOR DETERMINING THE AZIMUTH AND DIP OF SULPHIDE DEPOSITS**
Arthur A. Brant, Clarkdale, Ariz., assignor to Newmont Mining Corporation, New York, N. Y., a corporation of Delaware
Application October 4, 1954, Serial No. 460,214
11 Claims. (Cl. 324—1)

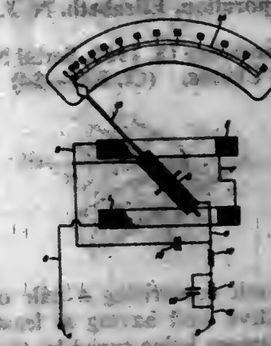


1. A method for establishing the azimuthal position of a sub-surface scattered sulphide body relative to a drill hole, said method comprising inserting a pair of charging electrodes into exposed ground at points spaced from and on diametrically opposite sides of the drill hole, inserting a first pick-up electrode into the ground at a point relatively far removed from the drill hole and each of the charging electrodes, inserting a second pick-up electrode into the ground wall defining the drill hole, impressing a pulse of current through the charging electrodes and measuring the resultant voltage appearing across the pick-up electrodes immediately after the termination of the current pulse, moving the second pick-up electrode in discrete steps along the drill hole, and measuring the resultant voltage appearing across the pick-up electrodes immediately upon termination of a current pulse through the charging electrodes for each new position of the second pick-up electrode, the polarities of the said resultant voltages being indicative of the location of the sulphide body relative to the drill hole and either of the charging electrodes.

2,769,957
**COMPARATOR**
Ralph Zito, Jr., Mount Vernon, and Frederick S. Dellenbaugh III, Chappaqua, N. Y., assignors to General Precision Laboratory Incorporated, a corporation of New York
Application July 31, 1953, Serial No. 371,612
6 Claims. (Cl. 324—57)

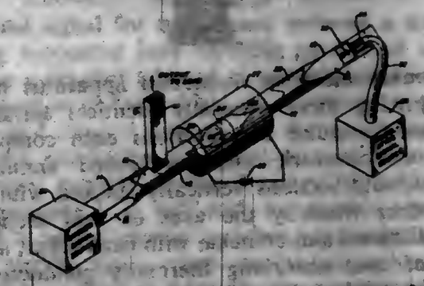


4. A device for determining the Q of a coil comprising, an adjustable frequency alternating current signal generator, an output circuit therefor, said coil being connected in shunt with said output circuit, a triode having its grid connected to one terminal of said coil and its cathode connected through an unbypassed resistor to the remaining terminal of said coil, a calibrating circuit connected in shunt with said output circuit consisting solely of resistive elements and including an adjustable resistor and a potential dividing resistor connected in series, said potential dividing resistor having an intermediate terminal so positioned that the resistance included between said intermediate terminal and one end of the resistor is .707 of the total resistance of said potential dividing resistor, a triode having its cathode connected through an unbypassed resistor to one end terminal of said potential dividing resistor, switch means selectively connecting the grid of said triode to the other end terminal



and the intermediate terminal of said potential dividing resistor, a pair of resistors connected in series between intermediate terminals of said cathode resistors, a vibrator having a pair of fixed contacts each connected to respective opposed end terminals of said pair of series resistors and an armature connected in common to the ends of said cathode resistors remote from the respective cathodes, means for operating said armature at a frequency not exceeding one-half of the frequency of the signal produced by said alternating current signal generator, an amplifier having its input connected to the common junction of said pair of series resistors and its output connected to the deflection circuit of a cathode ray oscilloscope.

2,769,958
**AUTOMATIC MEASURING AND PRINTING APPARATUS**
Stanley George Meadows, Hemelhempstead, Lister Hollas, Romford, and Edward Searles, Plumstead, London, England, assignors to Southern United Telephone Cables Limited, Dagenham Dock, Essex, England
Application May 25, 1953, Serial No. 356,972
8 Claims. (Cl. 324—73)



1. Apparatus for automatically obtaining and printing the reading of an instrument or a group of instruments and for printing successive readings as columns of figures on a record sheet, comprising a record sheet carrier, means for producing relative step-by-step movement between the carrier and a printing position, a number of type-actuating electro-magnets, a cascade of relays for selecting circuits through the electro-magnets, means responsive to each instrument reading for actuating the relays to prepare the circuits to the type-actuating electro-magnets appropriate for that reading, a position switch operatively connected with and actuated by the relative step-by-step movement of the carrier, circuits to the electro-magnets for selection by the position switch according to the position of the carrier, and means for interrelating the circuits established by the cascade of relays with the circuits established in an associated position of the position switch to actuate the appropriate electro-magnets to print a part of the reading.

2,769,959
**DYNAMOMETER INSTRUMENT**
Royden F. Estoppey, Berkeley Heights, N. J., assignor to Weston Electrical Instrument Corporation, Newark, N. J., a corporation of New Jersey
Application February 24, 1953, Serial No. 338,665
1 Claim. (Cl. 324—144)

A frequency compensated dynamometer voltmeter comprising a field coil and a movable coil connected in series, said movable coil being pivotally mounted for rotation to either side of the position of zero mutual inductance with respect to the field coil upon connection of the field and movable coils to a source of alternating current; a pointer carried by the field coil and cooperating with a scale calibrated in volts; and a capacitor connected directly across the movable coil, said capacitor having a value such that the circulating current flowing in the movable coil and capacitor as a result of the voltage induced in the movable coil will produce a coil rotation torque that is opposite to that brought about by a corresponding change in the mutual inductance between the field coil and movable coil as the latter is displaced from the position of zero mutual inductance.

2,769,960
**NON-RECIPROCAL WAVE TRANSMISSION NETWORKS**
William W. Mumford, Atlantic Highlands, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application December 27, 1951, Serial No. 263,656
3 Claims. (Cl. 332—52)

1. Modulating apparatus comprising a section of wave guide adapted to support electromagnetic wave energy in a plurality of linear polarizations, a pair of polarization-selective connections at one location along said guide each coupled to an orthogonal polarization of linearly polarized wave energy at said location, a source of linearly polar-

and carrier energy connected to one of said connections, a load circuit connected to the other of said connections, a polarization-selective connection at another location along said guide coupled to a polarization of linearly polarized wave energy therein related by an angle to the polarization of said one connection at said one location, a source of modulating energy, a non-linear impedance coupling said modulating source exclusively to said linearly polarized energy in said connection at said other location, and a ferromagnetic element producing a Faraday-effect rotation of polarization of said energy interposed in said guide between said locations and having an angle of rotation equal to said angle.

---

2,769,961

**HIGH FREQUENCY INTERSTAGE COUPLING**

John Chesney, Roselle Park, N. J., assignor to General Instrument Corporation, Elizabeth, N. J., a corporation of New Jersey

Application December 18, 1953, Serial No. 398,940
10 Claims. (Cl. 333—24)

1. In a tuning unit comprising a pair of stages separated by a conductive wall having at least one opening therethrough, said stages being tuned by the simultaneous rotation of tuning elements for each stage, said elements being mounted on a common shaft passing through an opening in and spaced from said wall; a combined coupling and shaft-contacting element comprising a pair of wiper segments, one on each side of said wall, one end of each of the said segments being conductively secured to said wall, the other ends of said segments being conductively connected by a member separate from said shaft which passes through and is spaced from an opening in said wall, said segments engaging said shaft and wiping thereover as said shaft is rotated.

---

2,769,962

**COOLING MEANS FOR LAMINATED MAGNETIC CORES**

William S. Melville, Rugby, England, assignor to The British Thomson-Houston Company Limited, a British company

Application July 1, 1953, Serial No. 365,508
Claims priority, application Great Britain August 22, 1952
1 Claim. (Cl. 336—61)

A stationary electrical induction apparatus magnetic core comprising three generally identical spirally strip wound closed annular core sections each comprising a plurality of concentric and superposed annular turn laminations, said sections vertically stacked with respect to each other whereby the axes of said sections are vertically disposed and coincide with each other, an annular body of heat absorbing thermally conductive nonmagnetic material positioned between the uppermost and central sections and making contact with all of the bottom side edges of all of the turn laminations of said uppermost section, an annular portion of electrical insulating material disposed between said conductive body and central section making contact with said conductive body and the upper side edges of all of the turn laminations of said central section, another annular conductive body and insulating portion identical to said first mentioned annular conductive body and insulating portion identically disposed with respect to said central section and the lowermost of said sections as said first mentioned annular conductive body and insulating portion are disposed with respect to said uppermost and central sections, a third annular conductive body identical to said first mentioned conductive body identically disposed with respect to said lowermost section as said first mentioned conductive body is disposed with respect to said uppermost section, each of said conductive bodies having an annular cooling duct formed therein, a cooling fluid circulated through said cooling ducts, and annular electrical insulating material plates disposed against the uppermost surface of said uppermost section and said third annular conductive body for clamping all of said sections, conductive bodies, and insulating portions therebetween each of said core sections having a narrow depth measured in a direction parallel to the axis thereof.

---

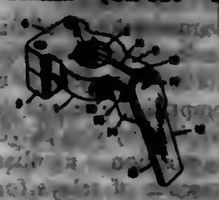
2,769,963

**HIGH-FREQUENCY COIL OF THE KIND COMPRISING A TAPPING WHICH IS DISPLACEABLE BY MEANS OF A SCREW SPINDLE**

Geerwijn Van Gelder and Wilhelmus Lambertus Yervaat, Hilversum, Netherlands, assignors to Hartford National Bank and Trust Company, Hartford, Conn., as trustee

Application October 29, 1952, Serial No. 317,412
Claims priority, application Netherlands October 30, 1951
11 Claims. (Cl. 336—139)

1. A high frequency coil comprising a support, a spindle having a right and a left handed screw thread, said spindle having a given longitudinal axis and being mounted on said support, a contact carrier displaceable along said longitudinal axis, a right hand threaded member supported by and freely rotatable within the contact carrier, a left hand threaded member also supported by and freely rotatable within the contact carrier, both of said threaded members being mounted in engagement with the threaded spindle, a spiral shaped conductor, a contact member mounted on said carrier, said contact member having an engaged position in which said contact member engages said conductor, and coupling means responsive to the position of the carrier to link the contact carrier alternately with the right hand threaded member when at one end of said conductor and then with the left hand threaded member when at the opposite end of said conductor, whereby rotation in only one direction causes a forward and backward motion of the carrier.



---

2,769,964

**BATTERY TERMINAL CONNECTOR**

George F. Lantz, Sterling, Wis.

Application January 30, 1952, Serial No. 269,043
1 Claim. (Cl. 339—226)

In a battery terminal connector having a clamp with a pair of arms in spaced relation with each other and

forming an opening therebetween for receiving a battery terminal, an integral lever member for clamping the arms together about the battery terminal and for spreading the arms to release the terminal, said lever member being of uniform thickness and comprising an elongated handle, two side ears at one end portion of the handle and on opposite sides thereof, pivot means mounting said side ears near the respective outer upper corners of the clamp arms of the connector with the clamp arms being disposed between the ears, said side ears having opposed inner surfaces which diverge outwardly from the handle at an acute angle, the dimension between the side ears at the pivot means being greater than the dimension between the upper parts thereof to provide a clamping action between the ears upon the clamp arms as the lever member is pivoted to a closed position with the elongated handle overlying the battery terminal, and a finger member of outwardly converging wedge form and depending centrally from the end of the elongated handle adjacent the pivot mounting means positioned apart from the clamp arms when the handle overlies the battery terminal, said finger member being separate from the pivot means and movable through a path to wedge between and to separate the clamp arms as the lever member is pivoted to an open position.

---

2,769,965

**NYLON-JACKETED CONNECTOR**

John Nelson Frey, Moorestown, N. J., assignor to The Thomas & Betts Co., Elizabeth, N. J., a corporation of New Jersey

Continuation of application Serial No. 233,662, June 26, 1951. This application March 7, 1956, Serial No. 570,975
11 Claims. (Cl. 339—276)

1. In the art of crimping an electric connector onto a conductor therein, wherein the connector comprises three preformed members in telescopic relation, the inner member being a sleeve of highly conductive malleable metal fashioned to form mechanical and electrical engagement with a conductor therein, the intermediate member being a sleeve of thin malleable metal and the outer member being a sleeve formed of insulating material having plastic memory said capable of automatically distending outwardly towards its original configuration when free of inwardly deforming forces, and wherein the outer sleeve initially has an internal diameter slightly less than the external diameter of the intermediate sleeve, the method which consists in momentarily stretching the outer sleeve, drawing the outer sleeve while so stretched over the intermediate sleeve to cause the outer sleeve to engage the intermediate sleeve frictionally but otherwise free to creep thereon, subjecting the connector so assembled for a limited length thereof to a crimping squeeze force applied from the outside through all three sleeves, with a force sufficient to bend inwardly both the inner sleeve and the intermediate sleeve beyond their respective elastic limits and thus permanently deform the inner sleeve into a crimped engagement with conductors therein and to deform both the inner and intermediate sleeves into an interlocking relation, and finally releasing the connector from all deforming forces acting thereon and thus to permit the outer sleeve in the area so squeezed to recede outwardly by virtue of its plastic memory from the inwardly deformed portion of the intermediate sleeve, thereby to form an air space between the outer and intermediate sleeves at the place so deformed while permitting readjustment to take place automatically between the outer and intermediate sleeves.

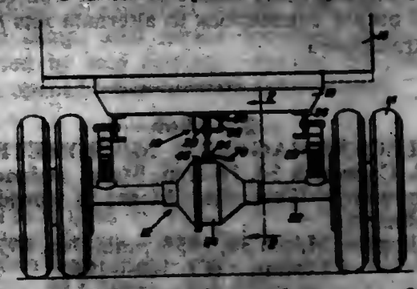
2,769,966

**SOUND SYSTEM**

Robert H. Rines, Brookline, Mass.

Original application October 29, 1945, Serial No. 625,162. Divided and this application July 24, 1947, Serial No. 763,390
9 Claims. (Cl. 340—3)

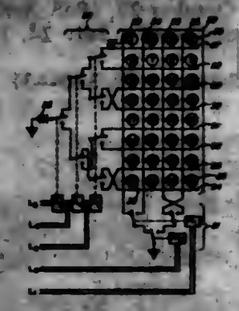
2. An electric system having, in combination, sound-locating means for detecting an object provided with explodable means, voltage-producing means for continuously selecting a future position of the explodable object, and sound-controlled means separate from the sound-locating means responsive to the voltage of the selecting means and to the sound-locating means for automatically energizing the explodable means to explode the object when it reaches the future position during the continued detecting of the object by the sound-locating means.



---

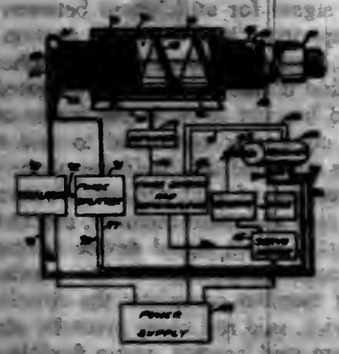
2,769,967

**LOAD SIGNAL FOR VEHICLES**



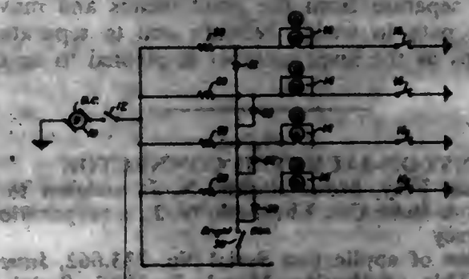
Josef S. Lukocevich, Tallmadge, Ohio

Application December 7, 1954, Serial No. 473,567
3 Claims. (Cl. 340—52)



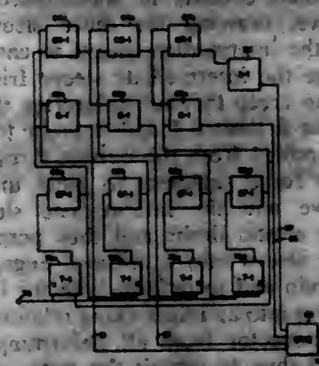
2. A load signal for attachment between a frame and the spring supported load carrying portion of a vehicle comprising a bracket adapted to be attached to the load carrying portion of the vehicle, an elongated rod projecting from said bracket towards the frame of the vehicle, an electrical conductor connected to said rod, an abutment member mounted on the frame of the vehicle in the path of movement of said rod, an electrical conductor connected to said abutment member, means for supplying electrical energy, and a signal device interconnecting the ends of the conductors whereby the contact of the rod and abutment member completes the circuit and actuates the signal device, said rod being pivotally attached to and depending from said bracket, and a flexible control cable attached to said rod for pivoting the rod to an inoperative position, said control cable terminating remotely from the rod adjacent the vehicle controls.

2,769,968
MATRIX TYPE DECODING CIRCUIT FOR BINARY CODE SIGNALS
Henry R. Schuchleiz, Jr., Reseda, Calif., assignor to Bendix Aviation Corporation, North Hollywood, Calif., a corporation of Delaware
Application July 13, 1953, Serial No. 367,554
1 Claim. (Cl. 340—166)



Apparatus for decoding multidigit reflected binary code signals of $z$ digits comprising: a plurality of two-position digit relays, one for each digit of the code, each adapted to be actuated by a separate digit signal of said code and having one or more sets of transfer contacts, said relays being constituted by a first group of $x$ relays associated with the lower digits of the code and a second group of $y$ relays associated with the higher digits of the code; a matrix circuit comprising a first group of busses $2^x$ in number, a second group of busses $2^y$ in number and $2^x2^y$ electrical indicators each responsive to potential between a different pair of first and second group busses; a source of potential; means connecting the contacts of said first group of $x$ relays in a first tree circuit between one terminal of said source and all the busses of said first group; means connecting the contacts of said second group of $y$ relays in a tree circuit between the other terminal of said source and all the busses of said second group; each tree circuit having as many tiers as tere are relays in its associated group and the lowest tier relay in each group having one transfer contact set, and each other relay having twice as many independent transfer contact sets as the next lower tier relay; the lowest digit relay in each group being in the highest tier in the associated tree circuit and successively higher digit relays being in successively lower tiers of the tree circuit, and each tier of said tree circuits containing more than one set of transfer contacts having its output connections to alternate sets of transfer contacts transposed.

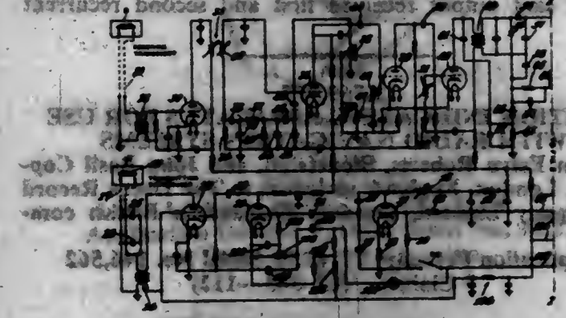
2,769,969
ELECTROMAGNETIC MICROMETER
George E. Comstock 3d, Holden, Mass., assignor to Norton Company, Worcester, Mass., a corporation of Massachusetts
Application March 30, 1955, Serial No. 497,940
6 Claims. (Cl. 340—196)



1. In apparatus of the class described, means for producing two phase alternating current voltage, a transformer primary connected to said means for producing two phase voltage, said primary comprising a pair of bifilar windings, said bifilar windings being helical of equal lead and arranged in overlapping relation, a transformer secondary the turns of which are helical and spaced by a uniform distance from said primary bifilar windings and said turns having the same lead as the turns of the said primary bifilar windings, a pair of rectilinearly movable machine elements, said primary being secured to one of said pair of elements and said secondary being secured to the other of said pair of elements, electrical means connected to the transformer secondary giving an output responsive to the relative position of said primary with respect to said secondary, and means responsive to said output to indicate said relative position of the machine elements.

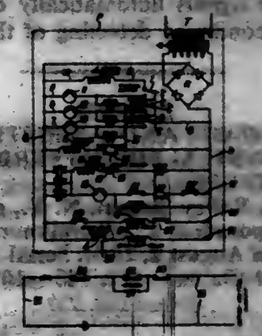
2,769,970
INDICATOR LAMP DIMMING CIRCUIT
Robert E. Kentville, Torrance, Calif., assignor to Theodore W. Hallerberg, Los Angeles, Calif.
Application February 9, 1956, Serial No. 564,556
2 Claims. (Cl. 340—213)

1. In a warning system or the like comprising a power source, a plurality of parallel indicating circuits connected to said power source, each parallel circuit including a resistor, an indicating device and a function switch in series, the improvement comprising means to shunt the resistor in each of said parallel circuits including a diode connected between the resistor and indicating device and conducting in the direction of or away from said indicating device, depending on circuit polarity, and a single switch connected between said power source and all of said diodes in parallel, whereby closure of a function switch will cause only its associated indicating device to be connected to said power source through its connected diode and around its associated resistor when said single switch is closed.



2,769,971
RING CHECKING CIRCUIT
Charles J. Bashe, Poughkeepsie, N. Y., assignor to International Business Machines Corporation, New York, N. Y., a corporation of New York
Application October 4, 1954, Serial No. 460,690
7 Claims. (Cl. 340—213)

1. A storage checking circuit for a plurality of electronic bistable devices each of which has an "on" and "off" condition comprising sensing means associated with said plurality of electronic bistable devices for sensing the storage condition of said plurality of electronic bistable devices and indicator means responsive to said sensing means for producing an error indication whenever none or more than one of said plurality of electronic bistable devices is in an "on" condition.

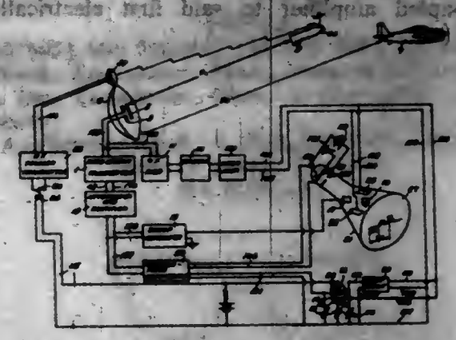


2,769,972
METHOD AND APPARATUS FOR DETECTING MOTION
Leslie A. MacDonald, New Hyde Park, N. Y., assignor to American District Telegraph Company, Jersey City, N. J., a corporation of New Jersey
Application March 18, 1954, Serial No. 416,350
24 Claims. (Cl. 340—258)

1. A motion detection system, comprising an oscillator for producing a first alternating current having a given frequency, transmitting means coupled to said oscillator and arranged to convert said alternating current into radiant energy, receiving means arranged to receive radiant energy transmitted by said transmitting means and to convert said received radiant energy into a second alternating current, alarm indicating means, means responsive to modulation components in said second alternating current to produce an alarm signal, means to apply said alarm signal to said alarm indicating means in a sense to cause the latter to produce an alarm indication, means to derive from said second alternating current a supervisory signal proportional in amplitude to the strength of the received radiant energy, means to apply said supervisory signal to said oscillator in a sense to change the frequency of the first alternating current in response to changes in strength of the received radiant energy, and means to apply said supervisory signal to said alarm indicating means in a sense to cause the latter to produce an alarm indication in response to a drop in received radiant energy below a predetermined level.

2,769,973
MEANS FOR INDICATING FAULTS ON ELECTRICALLY DRIVEN CONVEYOR SYSTEMS
George Denholm and Leonard Archer Nordmann, Gateshead-on-Tyne, England, assignors to Hugh Wood & Company Limited, Gateshead-on-Tyne, England, a British company
Application September 23, 1953, Serial No. 381,911
Claims priority, application Great Britain December 17, 1952
6 Claims. (Cl. 340—267)

1. In an electrical belt conveyor system comprising a belt conveyor fitted with a set of protective devices including one appertaining to belt slip and breakage and including another protective device appertaining to a condition other than belt slip and breakage, a set of electrically operated fault-indicating devices appertaining to the respective said protective devices, means operative on the functioning of said other protective device to energise the respective fault-indicating device, while at that time preventing energization of the belt slip and breakage indicating device, and means operative at starting of said conveyor to prevent energisation of the belt slip and breakage indicating device during a time-delay period and at the expiration of that period automatically to set

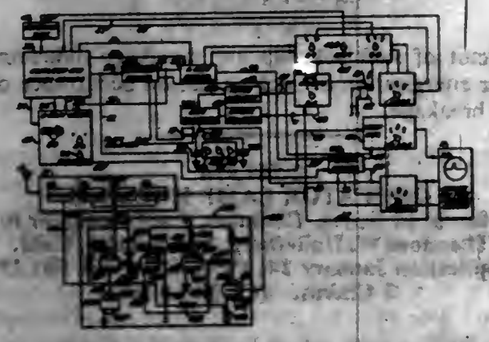


the circuit of said belt slip and breakage indicating device for energisation of such device on occurrence of belt slip or breakage.

2,769,974
INDICATOR LAMP HOUSING
Marvin F. Hayes, Compton, Calif., assignor to Theodore W. Hallerberg, Los Angeles, Calif.
Application January 24, 1956, Serial No. 561,170
3 Claims. (Cl. 340—366)

1. A lamp container for an illuminatable warning device comprising an outer housing, a hollow lamp-carrying block mounted for rotation within said housing, said block having a portion thereof constituting a translucent indicia bearing face, at least one lamp having its bulb portion extending into said hollow block and having its base portion extending outwardly thereof, a stationary electrical contact carried within said housing and registering with said lamp base contact when said block is in a predetermined position, said lamp base contacts being movable out of registry with said stationary contacts by partial rotation of said block, and means carried by said block to establish an electrical contact with the shell portion of said lamp, said means including a stationary contact carried by said housing whereby the circuit to said lamp is opened when said block is rotated.

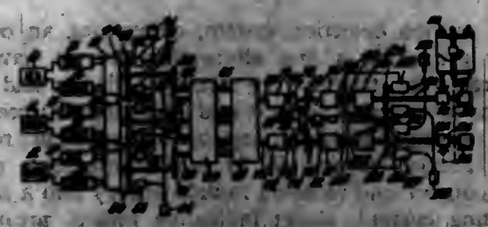
2,769,975
ELECTROMAGNETIC OBJECT-TRACKING-AND-DESTROYING METHOD AND SYSTEM
Robert Harvey Rines, Brookline, Mass.
Application October 29, 1945, Serial No. 625,162
44 Claims. (Cl. 343—7)



1. An electric system having, in combination, means for detecting an explodable object and producing a voltage signal corresponding to the same, means for produc-

ing a voltage signal indicative of the occupation by the object of a predetermined position, and means separate from the detecting means for thereupon in response to the said voltage signals automatically exploding the object during the continued detecting of the object.

---



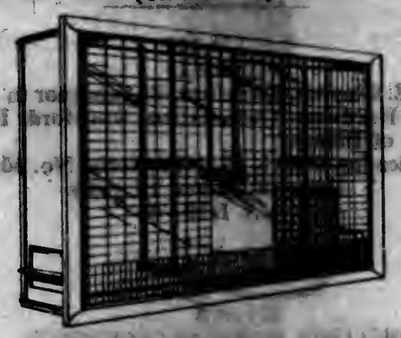
2,769,976
**AUTOMATIC GAIN AND AMPLITUDE BALANCE CONTROL SYSTEM FOR HYPERBOLIC NAVIGATION RECEIVERS**
Edward Durbin, Valley Stream, N. Y., assignor to Sperry Rand Corporation, a corporation of Delaware
Application August 2, 1954, Serial No. 446,999
9 Claims. (Cl. 343—103)

1. In a radio navigation receiver responsive to recurrent pulses including a first pulse received during a first time interval and a second pulse received during a second time interval wherein the strength of the received first pulses may be different from the strength of the received second pulses, said receiver including first and second electrically controllable variable gain amplifiers; means for producing a voltage whose phase is determined by the strength of the received first pulses relative to the strength of the received second pulses and whose amplitude is determined by the difference in strengths between the received first and second pulses, comprising in combination, first and second condensers, switching means coupled to said first and second condensers, means energizing said switching means for coupling said first condenser across the output of said navigation receiver during said first time interval and for coupling said second condenser across the output of said navigation receiver during said second time interval, said first condenser being responsive to said first pulse for producing a first direct potential varying according to the strength of said first pulse, said second condenser being responsive to said second pulse for producing a second direct potential varying according to the strength of said second pulse, the voltage across the output of said receiver alternating between said first direct potential and said second direct potential, direct-coupled amplifier means coupled to the output of said navigation receiver for amplifying said voltage alternating between said first and second direct potentials, means coupling said amplified voltage from the output of said direct-coupled amplifier to said first electrically controllable variable gain amplifier for varying the gain of said receiver during one of said time intervals, integrating means coupled to the output of said direct-coupled amplifier, said integrating means including a series resistor and a shunt condenser, said shunt condenser being charged by the amplified voltage alternating between said first and second direct potentials, rectifier means coupled across said series resistor, said rectifier means partially discharging said shunt condenser when the voltage across said shunt condenser increases above the value of one of the amplified first and second direct potentials, and means coupling the voltage across said shunt condenser varying substantially according to the magnitude of one of the amplified first and second direct potentials to said second electrically controllable variable gain amplifier for substantially suppressing variations in the magnitude of one of said output received first and second recurrent pulses.

---

2,769,977
**POSITION INDICATING APPARATUS FOR USE WITH RADIO NAVIGATION SYSTEMS**
Graham Estyn Roberts, Stanleigh, and John Basil Copping, London, England, assignors to The Decca Record Company Limited, London, England, a British company
Application February 27, 1950, Serial No. 146,562
9 Claims. (Cl. 343—112)

1. For use with a radio navigation system having means on a vehicle for producing at least two sets of electrical signals providing positional information from which the chart position of the vehicle can be determined, a chart position indicating apparatus comprising: a chart movable to and fro in one direction; an index movable to and fro over the chart in a transverse direction; electro-mechanical means responsive to one of said sets of signals for moving the chart in said one direction in accordance with changes in said signals; electro-mechanical means responsive to another of said sets of signals for moving the index over the chart in said transverse direction in accordance with changes in said signals; a stylus carried by said index and arranged to mark the chart so that the movements of the index relative to the chart are recorded thereon; shifting means operable upon periodic actuation to displace and return the stylus relative to the chart, whereby marks may be made on the recorded track of the vehicle at successive periodically occurring instants; and actuating means coupled to said shifting means and responsive to periodic modification of one of said sets of signals for actuating said shifting means.

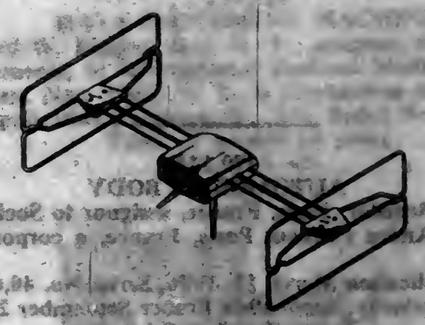


# DESIGNS

## NOVEMBER 6, 1956

179,107
**PIG CREEP FEEDER**
John Quincy Adams, Clark, Mo.
Application June 2, 1955, Serial No. 36,335
Term of patent 14 years
(Cl. D12—2)

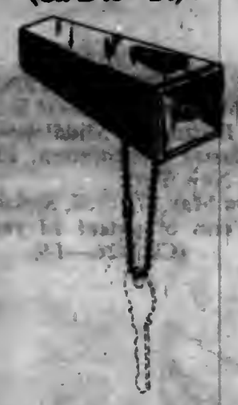
179,108
**BIRD CAGE**
Adolph Adamson, Lomita, Calif.
Application October 7, 1955, Serial No. 38,275
Term of patent 14 years
(Cl. D31—2)



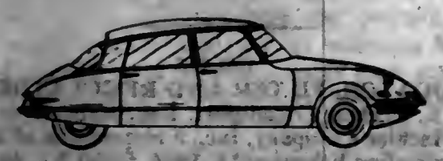
179,109
**RUBBER BABY PANTS**
Paul E. Ambrose, Dover, Del., assignor to International Latex Corporation, Dover, Del., a corporation of Delaware
Application January 11, 1955, Serial No. 33,928
Term of patent 14 years
(Cl. D3—17)

179,110
**FLEXIBLE DIATHERMY ELECTRODE**
Fritz A. Anderson, Milton, and Sherrill K. Rasmussen, Milton Junction, Wis., assignors to The Burdick Corporation, Milton, Wis., a corporation of Delaware
Application April 7, 1954, Serial No. 29,888
Term of patent 14 years
(Cl. D26—1)

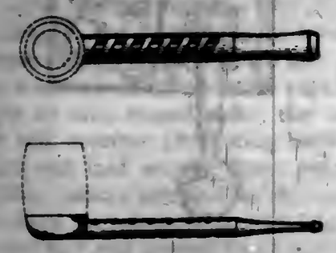
179,111
**TELEVISION ANTENNA**
Alex M. Ballan, Wawarsing, Albert Sokol, Ellenville, and Thomas Arlan Richmond, Middletown, N. Y., assignors to Channel Master Corporation, Ellenville, N. N. Y., a corporation of New York
Application May 17, 1956, Serial No. 41,523
Term of patent 14 years
(Cl. D26—14)



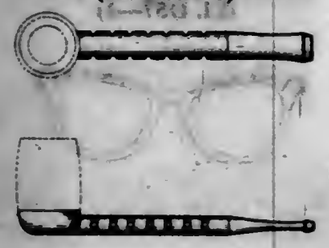
179,112
**LUBRICATOR, FILTER AND REGULATOR UNIT**
Robert E. Becher, Logansport, Ind., assignor to Logansport Machine Company, Inc., a corporation of Indiana
Application February 14, 1956, Serial No. 40,164
Term of patent 14 years
(Cl. D52—1)



179,113
**SUNGLASS FRAME FRONT OR THE LIKE**
Jack Bloch, Leominster, Mass., assignor to Foster Grant Co., Inc., Leominster, Mass., a corporation of Massachusetts
Application April 10, 1956, Serial No. 41,009
Term of patent 14 years
(Cl. D57—1)



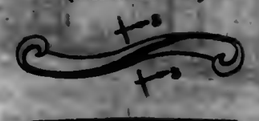
179,114
COMBINED FLASHLIGHT AND KEY CHAIN
Richard Brody, Sunnyside, N. Y.
Application July 11, 1956, Serial No. 42,215
Term of patent 14 years
(Cl. D48—24)



179,115
AUTOMOBILE BODY
Antoine Brueder, Paris, France, assignor to Societe Anonyme Andre Citroen, Paris, France, a corporation of France
Application March 19, 1956, Serial No. 40,663
Claims priority, application France September 22, 1955
Term of patent 14 years
(Cl. D14—3)

179,116
TOBACCO PIPE
Kenly C. Bagg, Fort Wayne, Ind., assignor to Falcon Industries, Inc., Fort Wayne, Ind., a corporation of Indiana
Application January 6, 1955, Serial No. 33,858
Term of patent 14 years
(Cl. D85—8)

179,117
SMOKER'S PIPE
Kenly C. Bagg, Fort Wayne, Ind., assignor to Falcon Industries, Inc., Fort Wayne, Ind., a corporation of Indiana
Application January 6, 1955, Serial No. 33,859
Term of patent 14 years
(Cl. D85—8)

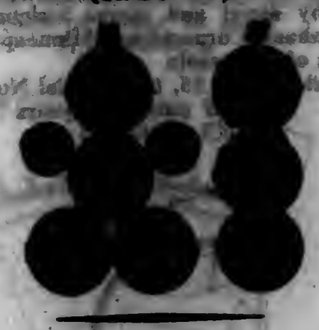


179,118
FISHING LURE
Frank P. Caldwell, Sr., St. Petersburg, Fla.
Application September 13, 1955, Serial No. 37,896
Term of patent 14 years
(Cl. D31—4)

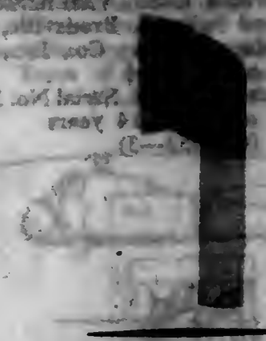
179,119
HOUSING FOR A SLIDE PROJECTOR OR THE LIKE
Dave Chapman, Chicago, Ill., assignor to Bell & Howell Company, Chicago, Ill., a corporation of Illinois
Application April 27, 1956, Serial No. 41,245
Term of patent 14 years
(Cl. D61—1)

179,120
PULL
La Verne E. Clayton, Rockford, Ill., assignor to American Cabinet Hardware Corporation, Rockford, Ill., a corporation of Illinois
Application March 30, 1956, Serial No. 40,842
Term of patent 14 years
(Cl. D10—8)

179,121
DRESS
Irving Cohen, New York, N. Y.
Application July 19, 1956, Serial No. 42,299
Term of patent 3½ years
(Cl. D3—26)



179,122
DRESS
Irving Cohen, New York, N. Y.
Application July 19, 1956, Serial No. 42,300
Term of patent 3½ years
(Cl. D3—26)



179,123
DOLL OR SIMILAR ARTICLE
Lillian de Rosbo, Ridgewood, N. J.
Application July 29, 1955, Serial No. 37,289
Term of patent 14 years
(Cl. D34—4)

179,124
PHOTOGRAPHIC FLASH UNIT
Henry Dreyfuss, South Pasadena, Calif., assignor to Minneapolis-Honeywell Regulator Company, Minneapolis, Minn., a corporation of Delaware
Application September 15, 1955, Serial No. 37,947
Term of patent 7 years
(Cl. D61—1)

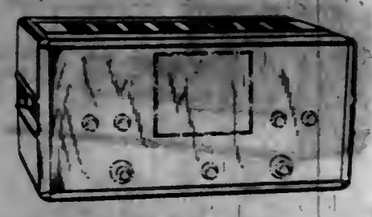
179,125
COMBINED BUMPER AND GRILLE
Harley J. Earl, Grosse Pointe Farms, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application December 22, 1955, Serial No. 39,454
Term of patent 7 years
(Cl. D14—6)

179,126
FOLDING GOLF CART
Henry B. Epley, Kirkland, Ohio
Application January 30, 1956, Serial No. 39,965
Term of patent 14 years
(Cl. D14—3)

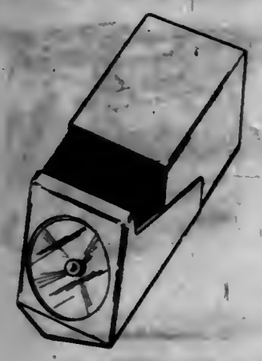
179,127
JOINTER FOR CIRCULAR SAW BLADES
John B. Engle, Los Angeles, Calif.
Application March 18, 1955, Serial No. 35,185
Term of patent 14 years
(Cl. D37—1)

179,128
DATA PROCESSING MACHINE
Richard W. Flagler, Rye, N. Y., assignor, by mesne assignments, to International Business Machines Corporation, New York, N. Y., a corporation of New York
Application February 29, 1956, Serial No. 40,403
Term of patent 14 years
(Cl. D26—1)

179,129
POPCORN DISPLAY STAND
Harold J. Fitzgerald, Milwaukee, Wis., assignor to Superdisplay, Inc., Milwaukee, Wis., a corporation of Wisconsin
Application August 15, 1956, Serial No. 37,462
Term of patent 14 years
(Cl. D60—11)



179,130
DRESS
Josephine Franzia, New York, N. Y.
Application July 30, 1956, Serial No. 42,454
Term of patent 3½ years
(Cl. D3—26)



179,131
**PASTRY CUTTER AND CRIMPER**
Walter L. Frey, Oakland, Calif.
Application April 10, 1956, Serial No. 40,993
Term of patent 7 years
(Cl. D44—1)

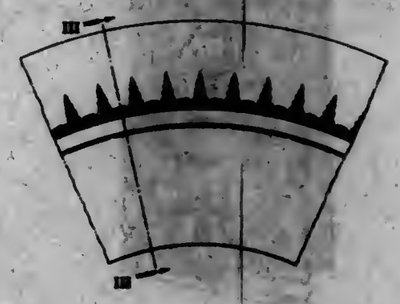
179,132
**VIDEO PHASE METER CABINET OR SIMILAR ARTICLE**
John W. Forrest, West Acton, Mass., assignor to Acton Laboratories, Acton, Mass.
Application July 7, 1954, Serial No. 31,306
Term of patent 14 years
(Cl. D26—5)

179,133
**BURGLAR ALARM OR SIMILAR ARTICLE**
Richard A. Gordon, Freeport, N. Y.
Application May 17, 1956, Serial No. 41,524
Term of patent 14 years
(Cl. D72—1)

179,134
**COMBINED ASH TRAY AND HOLDER**
Harold C. Grabfelder, Hollywood, Calif.
Application July 22, 1955, Serial No. 37,694
Term of patent 7 years
(Cl. D85—2)

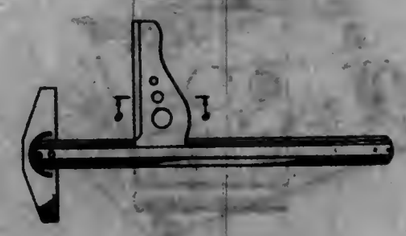
179,135
**TEA MAKER**
Maurice H. Graham, deceased, late of Minneapolis, Minn., by Maurice W. Graham, Minneapolis, Minn., and Northwestern National Bank, Minneapolis, Minn., executors, and John N. Pehrkon, Minneapolis, Minn., assignors, by direct and mesne assignments, to The M. H. Graham Corporation, Minneapolis, Minn., a corporation of Minnesota
Application April 25, 1956, Serial No. 41,269
Term of patent 14 years
(Cl. D44—36)

179,136
**MERCHANDISING MACHINE DISPLAY PANEL**
Robert Z. Greene, Norwalk, Conn., Yaul Benson, Newark, N. J., and Raymond Spilman, Bronxville, N. Y., assignors to Rowe Manufacturing Co., Inc., Whippany, N. J., a corporation of New York
Application October 25, 1954, Serial No. 32,820
Term of patent 14 years
(Cl. D52—3)



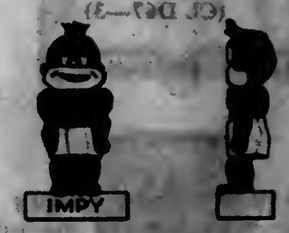
179,137
**DISPLAY DEVICE FOR CIGARETTE MERCHANDISING MACHINES**
Robert Z. Greene, Norwalk, Conn., Yaul Benson, Newark, N. J., and Raymond Spilman, Bronxville, N. Y., assignors to Rowe Manufacturing Co., Inc., Whippany, N. J., a corporation of New York
Application October 25, 1954, Serial No. 32,822
Term of patent 14 years
(Cl. D52—3)

179,138
**TIRE**
Frederick Walter Hertzler, Detroit, Mich., assignor to United States Rubber Company, New York, N. Y., a corporation of New Jersey
Application May 10, 1954, Serial No. 30,396
Term of patent 14 years
(Cl. D90—20)



179,139
**HELICOPTER**
Edward F. Katzenberger, Bridgeport, Conn., assignor to United Aircraft Corporation, East Hartford, Conn., a corporation of Delaware
Application February 23, 1955, Serial No. 34,645
Term of patent 14 years
(Cl. D71—1)

179,140
**AIR DIFFUSING REGISTER**
Frank C. Kiesner, St. Paul, Minn., assignor to Midco Register Corporation, St. Paul, Minn.
Application February 16, 1956, Serial No. 40,176
Term of patent 14 years
(Cl. D62—4)



179,141
**DRAFTING DEVICE**
Byron D. MacPherson, Seattle, Wash.
Application January 21, 1955, Serial No. 34,114
Term of patent 3½ years
(Cl. D52—1)

179,142
**PIANO CASE**
William Millington, Grand Rapids, Mich., and Wilbur M. Day, Kenwood, Ohio, assignors to The Baldwin Piano Company, Cincinnati, Ohio, a corporation of Ohio
Application February 10, 1955, Serial No. 34,460
Term of patent 14 years
(Cl. D46—9)

179,143
**CAKE OF SOAP**
Gladys A. Mitchell and Robert Reed Thomas, McFarland, Calif.
Application June 18, 1953, Serial No. 25,510
Term of patent 14 years
(Cl. D72—1)

179,144
**STAPLING MACHINE**
Erwin Mueller, Lingen (Ems), Germany
Application July 14, 1953, Serial No. 25,940
Claims priority, application Germany May 8, 1953
Term of patent 7 years
(Cl. D74—1)

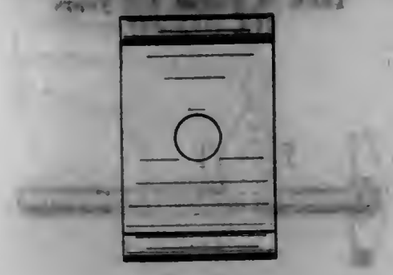
179,145
**SERVICE T**
Frank H. Mueller, Decatur, Ill., assignor to Mueller Co., Decatur, Ill., a corporation of Illinois
Application February 1, 1955, Serial No. 34,312
Term of patent 14 years
(Cl. D91—3)

179,146
WALL MOUNTED REFRIGERATOR
Robert E. Mauz, Jeffersontown, and William F. Seeger, Louisville, Ky., assignors to General Electric Company, a corporation of New York
Application November 29, 1955, Serial No. 39,084
Term of patent 14 years
(Cl. D67—3)

179,147
REFRIGERATOR CABINET
Robert E. Mauz, Jeffersontown, and William F. Seeger, Louisville, Ky., assignors to General Electric Company, a corporation of New York
Application November 29, 1955, Serial No. 39,085
Term of patent 14 years
(Cl. D67—3)

179,148
TOY TARGET
Clair Omar Musser, Studio City, Calif., assignor to Knickerbocker Plastic Company, Inc., North Hollywood, Calif., a corporation of California
Application October 20, 1955, Serial No. 38,496
Term of patent 14 years
(Cl. D34—5)

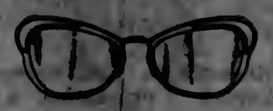
179,149
TOY TARGET
Clair Omar Musser, Studio City, Calif., assignor to Knickerbocker Plastic Company, Inc., North Hollywood, Calif., a corporation of California
Application October 20, 1955, Serial No. 38,497
Term of patent 14 years
(Cl. 34—5)



179,150
EAR RADIO
John R. Norris, Phoenix, Ariz.
Application March 1, 1956, Serial No. 40,429
Term of patent 14 years
(Cl. D56—4)

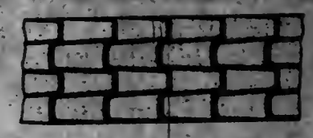
179,151
EAR RADIO
John R. Norris, Phoenix, Ariz.
Application March 1, 1956, Serial No. 40,432
Term of patent 14 years
(Cl. D56—4)

179,152
DOOR KNOB ESCUTCHEON PLATE
Richard J. Ohno, Branford, Conn., assignor to Sargent & Company, New Haven, Conn., a corporation of Connecticut
Application April 6, 1954, Serial No. 29,919
Term of patent 7 years
(Cl. D30—6)

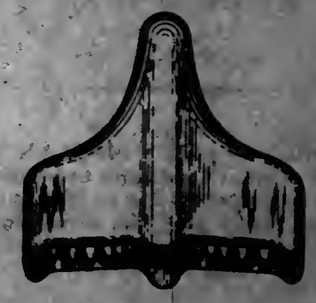


179,153
TABLECLOTH
Ferdinand P. Otto, Philadelphia, Pa., assignor to Mayfair Mills, Inc., Philadelphia, Pa.
Application January 26, 1956, Serial No. 39,921
Term of patent 7 years
(Cl. D92—26)

179,154
TABLECLOTH
Ferdinand P. Otto, Philadelphia, Pa., assignor to Mayfair Mills, Inc., Philadelphia, Pa.
Application March 13, 1956, Serial No. 40,580
Term of patent 7 years
(Cl. D92—26)

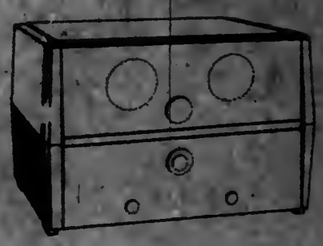


179,155
SPECTACLE FRONT
Robert Pasnet, Vincennes, France, assignor to Societe Industrielle de Lunetterie, Paris, France, a French company
Application April 19, 1955, Serial No. 35,578
Term of patent 14 years
(Cl. D57—1)

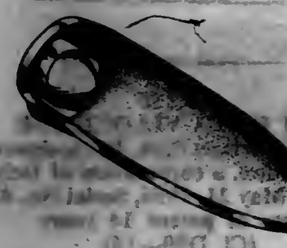


179,156
TOY ROCKET CONTROL PANEL
Anthony J. Palma, Oneida County, N. Y.
Application November 18, 1954, Serial No. 33,151
Term of patent 7 years
(Cl. D34—15)

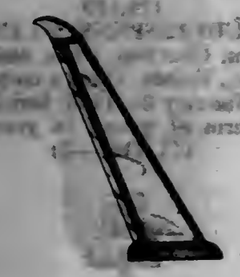
179,157
SPONGE UNDERLAY FOR CARPETS
William Perlman, Los Angeles, Calif.
Application December 13, 1955, Serial No. 39,313
Term of patent 14 years
(Cl. D92—4)



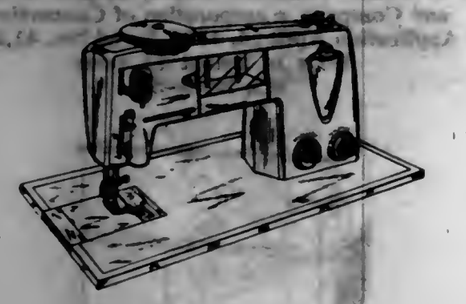
179,158
SEAT FOR A VELOCIPEDE
Roy A. Perlowski, Orland Park, Ill., assignor to Junior Toy Corporation, a corporation of Delaware
Application May 21, 1956, Serial No. 41,577
Term of patent 14 years
(Cl. D90—16)



179,159
LIQUID DISPENSING UNIT
Phillip D. Seubert, Charlton, Ohio, assignor to National Laboratories, Inc., Toledo, Ohio, a corporation of Ohio
Application January 24, 1956, Serial No. 39,894
Term of patent 14 years
(Cl. D62—2)



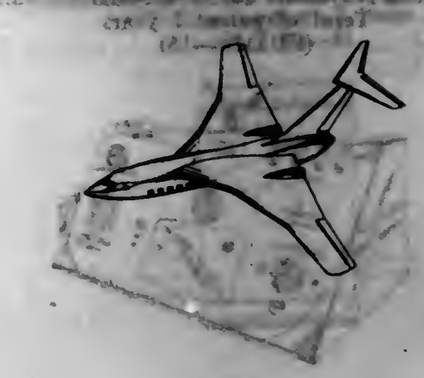
179,160
CABINET FOR ELECTRICAL APPARATUS OR SIMILAR ARTICLE
John A. Sandor, Stamford, Conn., assignor to Sarmoon and Company, a corporation of Connecticut
Application April 24, 1956, Serial No. 41,190
Term of patent 14 years
(Cl. D26—5)



179,161
**COMBINED LENS AND REFLECTOR FOR AUTOMOBILE LAMPS**
Joseph R. Schoonmaker, Birmingham, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application March 21, 1956, Serial No. 40,712
Term of patent 7 years
(Cl. D48—32)

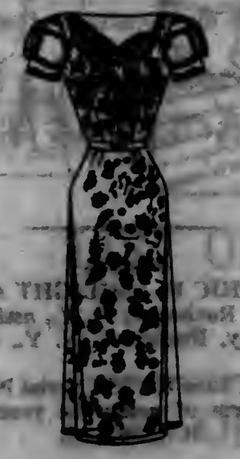
179,162
**AUTOMOBILE LAMP OR SIMILAR ARTICLE**
John Shake, Oak Park, Ill., assignor to Shake Mfg. & Tool Co., a corporation of Illinois
Application March 30, 1956, Serial No. 40,856
Term of patent 14 years
(Cl. D48—32)

179,163
**SEWING MACHINE**
French Eugene Smith, Akron, Ohio, assignor to White Sewing Machine Corporation, Lakewood, Ohio, a corporation of Delaware
Application October 20, 1955, Serial No. 38,490
Term of patent 14 years
(Cl. D70—1)

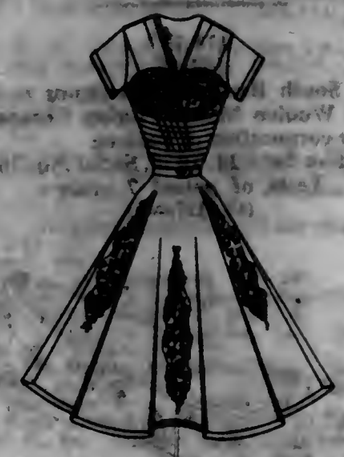


179,164
**COOKIE JAR**
Walter D. Starnes, Los Angeles, Calif., assignor to Walter Starnes, Inc., Los Angeles, Calif., a corporation of California
Application January 9, 1956, Serial No. 39,681
Term of patent 3½ years
(Cl. D58—25)

179,165
**CONTAINER FOR PLURAL CELL STORAGE BATTERY OR THE LIKE**
Charles A. Tocc, Sunland, and Robert Broussard, Glendale, Calif., assignors to Electro-Acid Corporation, Sunland, Calif., a corporation of Texas
Application May 2, 1955, Serial No. 35,767
Term of patent 14 years
(Cl. D26—5)

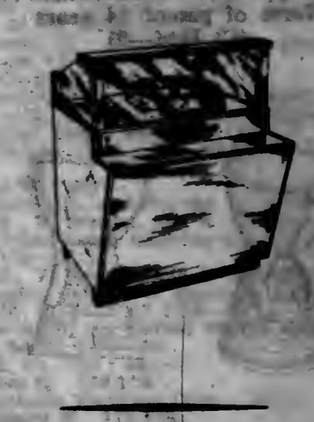


179,166
**AIRPLANE**
Walter Tydon, Hagerstown, Md., assignor to Fairchild Engine and Airplane Corporation, a corporation of Maryland
Application November 12, 1954, Serial No. 33,859
Term of patent 14 years
(Cl. D71—1)



179,167
**DRESS**
Mamie Vermeil, New York, N. Y.
Application July 19, 1956, Serial No. 42,301
Term of patent 3½ years
(Cl. D3—26)

179,168
**DRESS**
Mamie Vermeil, New York, N. Y.
Application July 19, 1956, Serial No. 42,302
Term of patent 3½ years
(Cl. D3—26)

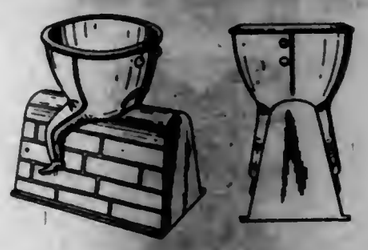


179,169
**MEDALLION**
Theodore Vladoff, Detroit, Mich.
Application August 1, 1955, Serial No. 37,253
Term of patent 14 years
(Cl. D14—6)

179,170
**AUTOMATIC POPCORN MACHINE**
Samuel M. Wenz, Kansas City, Mo., assignor to Manley, Inc., Kansas City, Mo., a corporation of Missouri
Application March 26, 1956, Serial No. 40,700
Term of patent 14 years
(Cl. D61—10)

179,171
**HOT DOG GRILLING MACHINE**
Samuel M. Wenz, Kansas City, Mo., assignor to Manley, Inc., Kansas City, Mo., a corporation of Missouri
Application May 7, 1956, Serial No. 41,369
Term of patent 14 years
(Cl. D61—10)

179,172
**AIR OPERABLE WIRE OR STRIP FEEDER FOR POWER PRESSES AND SPECIAL MACHINES**
George J. Weymouth, Fairfield, Conn., assignor to Cooper Weymouth, Incorporated, Bridgeport, Conn., a corporation of Connecticut
Application April 7, 1955, Serial No. 35,409
Term of patent 14 years
(Cl. D63—1)



179,173
BOTTLE OR SIMILAR ARTICLE
James H. Wilson, Broadway, Pa., assignor to The Charles E. Hires Company, Philadelphia, Pa., a corporation of Delaware
Application May 17, 1955, Serial No. 36,057
Term of patent 14 years
(Cl. D58—8)

179,174
EGG-CUP
Alexander Yelin, Brussels, Belgium
Application October 6, 1955, Serial No. 38,271
Claims priority, application Great Britain April 7, 1955
Term of patent 14 years
(Cl. D44—9)

179,175
EGG-CUP
Alexander Yelin, Brussels, Belgium
Application November 30, 1955, Serial No. 39,091
Term of patent 14 years
(Cl. D44—9)

179,176
PHOTOGRAPHIC FLASHLIGHT APPARATUS
Frank A. Zagara, Rochester, N. Y., assignor to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey
Application June 8, 1956, Serial No. 41,816
Term of patent 14 years
(Cl. D61—1)

179,177
SHOE
Harold Zisla, South Bend, Ind., assignor to Mishawaka Rubber and Woolen Manufacturing Company, Mishawaka, Ind., a corporation of Indiana
Application June 24, 1955, Serial No. 36,683
Term of patent 7 years
(Cl. D7—7)

# LIST OF REISSUE PATENTEES

TO WHOM

## PATENTS WERE ISSUED ON THE 6TH DAY OF NOVEMBER, 1956

NOTE.—Arranged in accordance with the first significant character or word of the name (in accordance with city and telephone directory practice).

Bedingfield, Sterling P. Oil well testing tool. Re. 24,236, 11-6-56, Cl. 166—188.
Geldhof, Peter E., and H. R. Morrison, to Whirlpool-Seeger Corp. Clothes drier and electrical control thereof. Re. 24,235, 11-6-56, Cl. 263—32.
Morrison, Harold R.: *See*—
Geldhof, Peter E., and Morrison. Re. 24,235.
Whirlpool-Seeger Corp.: *See*—
Geldhof, Peter E., and Morrison. Re. 24,235.

# LIST OF PLANT PATENTEES

Thompson, Leslie M. Almond tree. 1,526, 11-6-56, Cl. 47—82.

# LIST OF DESIGN PATENTEES

Acton Laboratories: *See*—
Forrest, John W. 179,132.
Adams, John Q. Pig creep feeder. 179,107, 11-6-56, Cl. D12—2.
Adamson, Adolph. Bird cage. 179,108, 11-6-56, Cl. D31—2.
Ambrose, Paul E., to International Latex Corp. Rubber baby pants. 179,109, 11-6-56, Cl. D8—17.
American Cabinet Hardware Corp.: *See*—
Clayton, La Verne B. 179,120.
Anderson, Fritz A., and S. K. Rasmussen, to The Burdick Corp. Flexible diathermy electrode. 179,110, 11-6-56, Cl. D26—1.
Baldwin Piano Co., The: *See*—
Millington, William, and Day. 179,142.
Ballan, Alex M., A. Sokol, and T. A. Richmond, to Channel Master Corp. Television antenna. 179,111, 11-6-56, Cl. D26—14.
Becker, Robert E., to Logansport Machine Co., Inc. Lubricator, filter and regulator unit. 179,112, 11-6-56, Cl. D52—1.
Bell & Howell Co.: *See*—
Chapman, Dave. 179,119.
Benson, Vaul: *See*—
Greene, Robert Z., Benson, and Spilman. 179,136.
Greene, Robert Z., Benson, and Spilman. 179,137.
Bloch, Jack, to Foster Grant Co., Inc. Sunglass frame front or the like. 179,113, 11-6-56, Cl. D57—1.
Brody, Richard. Combined flashlight and key chain. 179,114, 11-6-56, Cl. D48—24.
Broussard, Robert: *See*—
Toce, Charles A., and Broussard. 179,165.
Brueder, Antoine, to Societe Anonyme Andre Citroen. Automobile body. 179,115, 11-6-56, Cl. D14—3.
Bugg, Kenly C., to Falcon Industries, Inc. Tobacco pipe. 179,116, 11-6-56, Cl. D35—3.
Bugg, Kenly C., to Falcon Industries, Inc. Smoker's pipe. 179,117, 11-6-56, Cl. D35—3.
Burdick Corp., The: *See*—
Anderson, Fritz A., and Rasmussen. 179,110.
Caldwell, Frank P., Sr. Fishing lure. 179,118, 11-6-56, Cl. D31—4.
Channel Master Corp.: *See*—
Ballan, Alex M., Sokol, and Richmond. 179,111.
Chapman, Dave, to Bell & Howell Co. Housing for a slide projector or the like. 179,119, 11-6-56, Cl. D61—1.
Clayton, La Verne B., to American Cabinet Hardware Corp. Pull. 179,120, 11-6-56, Cl. D10—8.
Cohen, Irving. Dress. 179,121, 11-6-56, Cl. D3—26.
Cohen, Irving. Dress. 179,122, 11-6-56, Cl. D3—26.
Cooper Weymouth, Inc.: *See*—
Weymouth, George J. 179,172.
Day, Wilbur M.: *See*—
Millington, William, and Day. 179,142.
De Rocha, Lillian. Doll or similar article. 179,123, 11-6-56, Cl. D34—4.
Dreyfuss, Henry, to Minneapolis-Honeywell Regulator Co. Photographic flash unit. 179,124, 11-6-56, Cl. D61—1.
Earl, Harley J., to General Motors Corp. Combined bumper and grille. 179,125, 11-6-56, Cl. D14—6.
Eastman Kodak Co.: *See*—
Zagara, Frank A. 179,176.
Eding, Henry B. Folding golf cart. 179,126, 11-6-56, Cl. D17—3.
Electro-Acid Corp.: *See*—
Toce, Charles A., and Broussard. 179,165.
Eagle, John B. Jointer for circular saw blades. 179,127, 11-6-56, Cl. D27—1.
Fairchild Engine and Airplane Corp.: *See*—
Tydeman, Walter. 179,166.
Falcon Industries, Inc.: *See*—
Bugg, Kenly C. 179,116.
Bugg, Kenly C. 179,117.
Figgins, Richard W., to International Business Machines Corp. Data processing machine. 179,128, 11-6-56, Cl. D26—1.
Fitzgerald, Harold J., to Supurdisplay, Inc. Popcorn display stand. 179,129, 11-6-56, Cl. D60—11.
Forrest, John W., to Acton Laboratories. Video phone meter cabinet or similar article. 179,132, 11-6-56, Cl. D26—5.
Foster Grant Co., Inc.: *See*—
Bloch, Jack. 179,113.
Franits, Josephine. Dress. 179,130, 11-6-56, Cl. D3—26.
Frey, Walter L. Pastry cutter and crimper. 179,131, 11-6-56, Cl. D44—1.
General Electric Co.: *See*—
Munz, Robert E., and Saenger. 179,146.
Munz, Robert E., and Saenger. 179,147.
General Motors Corp.: *See*—
Earl, Harley J. 179,125.
Schemansky, Joseph R. 179,161.
Gordon, Richard A. Burglar alarm or similar article. 179,133, 11-6-56, Cl. D72—1.
Grabfelder, Harold C. Combined ash tray and holder. 179,134, 11-6-56, Cl. D85—2.
Graham, M. H., Corp., The: *See*—
Graham, Maurice H., and Polivka. 179,135.
Graham, Maurice H., deceased, by M. W. Graham and Northwestern National Bank, executors, and J. N. Polivka, to The M. H. Graham Corp. Tea maker. 179,135, 11-6-56, Cl. D44—26.
Graham, Maurice W.: *See*—
Graham, Maurice H., and Polivka. 179,135.
Greene, Robert Z., V. Benson, and R. Spilman, to Rowe Mfg. Co., Inc. Merchandising machine display panel. 179,136, 11-6-56, Cl. D52—3.
Greene, Robert Z., V. Benson, and R. Spilman, to Rowe Mfg. Co., Inc. Display device for cigarette merchandising machines. 179,137, 11-6-56, Cl. D52—3.
Hertzler, Frederick W., to United States Rubber Co. Tire. 179,138, 11-6-56, Cl. D90—20.
Hires, Charles E., Co., The: *See*—
Wilson, James H. 179,173.
International Business Machines Corp.: *See*—
Figgins, Richard W. 179,128.
International Latex Corp.: *See*—
Ambrose, Paul E. 179,109.
Junior Toy Corp.: *See*—
Perlowski, Roy A. 179,158.
Katzenberger, Edward F., to United Aircraft Corp. Helicopter. 179,139, 11-6-56, Cl. D71—1.
Kiesmer, Frank C., to Midco Register Corp. Air diffusing register. 179,140, 11-6-56, Cl. D62—4.
Knickerbocker Plastic Co., Inc.: *See*—
Musser, Clair O. 179,148.
Musser, Clair O. 179,149.
Logansport Machine Co., Inc.: *See*—
Becker, Robert E. 179,112.
MacPherson, Byron D. Drafting device. 179,141, 11-6-56, Cl. D52—1.
Manley, Inc.: *See*—
Waas, Samuel M. 179,170.
Waas, Samuel M. 179,171.
Mayfair Mills, Inc.: *See*—
Otto, Ferdinand P. 179,153.
Otto, Ferdinand P. 179,154.
Midco Register Corp.: *See*—
Kiesmer, Frank C. 179,140.
Millington, William, and W. M. Day, to The Baldwin Piano Co. Piano case. 179,142, 11-6-56, Cl. D56—9.
Minneapolis-Honeywell Regulator Co.: *See*—
Dreyfuss, Henry. 179,124.
Mishawaka Rubber and Woolen Mfg. Co.: *See*—
Zisla, Harold. 179,177.
Mitchell, Gladys A., and R. R. Thomas. Cake of soap. 179,143, 11-6-56, Cl. D73—1.

Mueller Co.: *See*—
Mueller, Frank H. 179,145.
Mueller, Irwin. Stapling machine. 179,144, 11–6–56, Cl. D74—1.
Mueller, Frank H., to Mueller Co. Service tee. 179,145, 11–6–56, Cl. D61—3.
Muns, Robert E., and W. F. Saenger, to General Electric Co. Wall mounted refrigerator. 179,146, 11–6–56, Cl. D67—3.
Muns, Robert E., and W. F. Saenger, to General Electric Co. Refrigerator cabinet. 179,147, 11–6–56, Cl. D67—3.
Musser, Clair O., to Knickerbocker Plastic Co., Inc. Toy target. 179,148, 11–6–56, Cl. D34—5.
Musser, Clair O., to Knickerbocker Plastic Co., Inc. Toy target. 179,149, 11–6–56, Cl. D34—5.
National Laboratories, Inc.: *See*—
Sanborn, Phillip D. 179,159.
Norris, John R. Ear radio. 179,150, 11–6–56, Cl. D56—4.
Norris, John R. Ear radio. 179,151, 11–6–56, Cl. D56—4.
Northwestern National Bank: *See*—
Graham, Maurice H., and Polivka. 179,135.
Ohno, Richard J., to Sargent & Co. Door knob escutcheon plate. 179,152, 11–6–56, Cl. D50—6.
Otto, Ferdinand P., to Mayfair Mills, Inc. Tablecloth. 179,153, 11–6–56, Cl. D02—26.
Otto, Ferdinand P., to Mayfair Mills, Inc. Tablecloth. 179,154, 11–6–56, Cl. D02—26.
Passet, Robert, to Societe Industrielle de Lunettterie. Spectacle front. 179,155, 11–6–56, Cl. D57—1.
Patane, Anthony J. Toy rocket control panel. 179,156, 11–6–56, Cl. D34—15.
Perlman, William. Sponge underlay for carpets. 179,157, 11–6–56, Cl. D02—4.
Perlowski, Roy A., to Junior Toy Corp. Seat for a velocipede. 179,158, 11–6–56, Cl. D00—16.
Polivka, John N.: *See*—
Graham, Maurice H., and Polivka. 179,135.
Rasmussen, Sherrill K.: *See*—
Anderson, Fritz A., and Rasmussen. 179,110.
Richmond, Thomas A.: *See*—
Ballan, Alex M., Sokol, and Richmond. 179,111.
Rowe Mfg. Co., Inc.: *See*—
Greene, Robert Z., Benson, and Spilman. 179,136.
Greene, Robert Z., Benson, and Spilman. 179,137.
Saenger, William F.: *See*—
Muns, Robert E., and Saenger. 179,146.
Muns, Robert E., and Saenger. 179,147.
Sanborn, Phillip D., to National Laboratories, Inc. Liquid dispensing unit. 179,159, 11–6–56, Cl. D62—2.
Sandor, John A., to Sorensen and Co. Cabinet for electrical apparatus or similar article. 179,160, 11–6–56, Cl. D26—5.
Sargent & Co.: *See*—
Ohno, Richard J. 179,152.
Schemansky, Joseph R., to General Motors Corp. Combined lens and reflector for automobile lamps. 179,161, 11–6–56, Cl. D48—32.
Sinko, John, to Sinko Mfg. & Tool Co. Automobile lamp or similar article. 179,162, 11–6–56, Cl. D48—32.
Sinko Mfg. & Tool Co.: *See*—
Sinko, John. 179,162.
Smith, French E., White Sewing Machine Corp. Sewing machine. 179,163, 11–6–56, Cl. D70—1.
Societe Anonyme Andre Citroen: *See*—
Breeder, Antoine. 179,115.
Societe Industrielle de Lunettterie: *See*—
Passet, Robert. 179,155.
Sokol, Albert: *See*—
Ballan, Alex M., Sokol, and Richmond. 179,111.
Sorensen and Co.: *See*—
Sandor, John A. 179,160.
Spilman, Raymond: *See*—
Greene, Robert Z., Benson, and Spilman. 179,136.
Greene, Robert Z., Benson, and Spilman. 179,137.
Starnes, Walter D., to Walter Starnes, Inc. Cookie jar. 179,164, 11–6–56, Cl. D32—29.
Starnes, Walter, Inc.: *See*—
Starnes, Walter D. 179,164.
Superdisplay, Inc.: *See*—
Fitzgerald, Harold J. 179,129.
Thomas, Robert E.: *See*—
Mitchell, Gladys A., and Thomas. 179,143.
Toce, Charles A., and E. Broussard, to Electro-Acid Corp. Container for plural cell storage battery or the like. 179,165, 11–6–56, Cl. D29—3.
Tydlan, Walter, to Fairchild Engine and Airplane Corp. Airplane. 179,166, 11–6–56, Cl. D71—1.
United Aircraft Corp.: *See*—
Katzenberger, Edward F. 179,139.
United States Rubber Co. *See*—
Hertzler, Frederick W. 179,138.
Verrand, Mamie, Dress. 179,167, 11–6–56, Cl. D3—26.
Verrand, Mamie, Dress. 179,168, 11–6–56, Cl. D3—26.
Vladeff, Theodore, Medallion. 179,169, 11–6–56, Cl. D14—6.
Waas, Samuel M., to Manley, Inc. Automatic popcorn machine. 179,170, 11–6–56, Cl. D61—10.
Waas, Samuel M., to Manley, Inc. Hot dog grilling machine. 179,171, 11–6–56, Cl. D61—10.
Weymouth, George J., to Cooper Weymouth, Inc. Air operable wire or strip feeder for power presses and special machines. 179,172, 11–6–56, Cl. D83—1.
White Sewing Machine Corp.: *See*—
Smith, French E. 179,163.
Wilson, James H., to The Charles E. Hires Co. Bottle or similar article. 179,173, 11–6–56, Cl. D56—6.
Yelin, Alexander. Egg-cup. 179,174, 11–6–56, Cl. D44—9.
Yelin, Alexander. Egg-cup. 179,175, 11–6–56, Cl. D44—9.
Zagara, Frank A., to Eastman Kodak Co. Photographic flash-light apparatus. 179,176, 11–6–56, Cl. D61—1.
Zisla, Harold, to Mishawaka Rubber and Woolen Mfg. Co. Shoe. 179,177, 11–6–56, Cl. D7—7.

# LIST OF PATENTEES

TO WHOM

## PATENTS WERE ISSUED ON THE 6TH DAY OF NOVEMBER, 1956

NOTE.—Arranged in accordance with the first significant character or word of the name (in accordance with city and telephone directory practice).

ACF Industries, Inc.: *See*—
Pletcher, William F. 2,769,404.
Aaron, J. D.: *See*—
Wright, Jacob J. 2,769,254.
Abbott Laboratories: *See*—
Sommers, Armiger H., and Barnes. 2,769,819.
Abbond, Harry L., ½ to J. A. Isen. Apparatus for separating aerosols from gases. 2,769,506, 11–6–56, Cl. 183—58.
Abel, Paul J., to The Yoder Co. Induction means. 2,769,085, 11–6–56, Cl. 219—6.5.
Abramson, Daniel J. Speculum. 2,769,441, 11–6–56, Cl. 128—4.
Achille, Pietro. Process for the production of sulphur and hydrogen sulphide from iron sulphides. 2,769,091, 11–6–56, Cl. 23—181.
Adams, Loyd, to Calavo Growers of California. Box unstacker. 2,769,570, 11–6–56, Cl. 221—225.
Aeroquip Corp.: *See*—
Herman, Albert D. 2,769,648.
Ahls, Peter: *See*—
Blankenagel, Heinrich, Ahls, and Ebersold. 2,769,609.
Air Force, United States of America as represented by the Secretary of the: *See*—
Soehngen, Erich. 2,769,334.
Air Preheater Corp., The: *See*—
Juhasz, Stephen. 2,769,619.
Akers, Roy J. Hand saw depth gauge. 2,769,470, 11–6–56, Cl. 145—55.
Albrecht, Otto: *See*—
Gaisy, Wilhelm, Albrecht, and Meyer. 2,769,684.
Alessio, James D.: *See*—
Soriano, Thomas J., and Alessio. 2,769,529.
Alexander, Frank M., and R. W. Bruso, to Brown Citrus Machinery Corp. Citrus juice extractor having peel separator. 2,769,472, 11–6–56, Cl. 146—3.
Alexander, Roy T.: *See*—
Burge, James S., McKee, Alexander, Conrad, Rider, Noetzel, and Salatin. 2,769,228.
Algiers, Paul J., and J. O. Kerstetval. Automatic fluid flow control device. 2,769,574, 11–6–56, Cl. 222—59.
Allen, George W., to The Singer Mfg. Co. Magnetic amplifier control device for an electromagnetic clutch. 2,769,931, 11–6–56, Cl. 310—85.
Allen, Howard G., and O. M. Hudson, to American Machine & Foundry Co. Pretzel machine. 2,769,407, 11–6–56, Cl. 107—8.
Allied Chemical & Dye Corp.: *See*—
Gilbert, Everett E., and Veldhuis. 2,769,836.
Joris, George G. 2,769,244.
All-Steel Equipment Inc.: *See*—
Rudolph, Nathan H. 2,769,562.
Alsing, Carl F., to Whirlpool-Seeger Corp. Two temperature household refrigerators. 2,769,319, 11–6–56, Cl. 62—116.
Altgelt, Herman E., to Deere & Co. Two-way plow with draft transmitting latch. 2,769,283, 11–6–56, Cl. 97—34.5.
American Cyanamid Co.: *See*—
Brown, Otto R. 2,769,540.

Harrison, John W., to Westinghouse Electric Corp. Electric immersion heater.

Harrold, Marshall C., and H. A. Wheeler, to General Motors Corp. Refrigerant expansion control.

Harstick, William H., F. G. Hododon, and H. W. Hein, to International Harvester Co. Pipe-line assembly and coupling means therefor.

Hart, Robert T., to R. D. Warren Co. Method of cast calendering paper.

Harter, Isaac, I. Harter, Jr., T. W. Ratcliffe, and F. W. Armstrong, Jr., to The Babcock & Wilcox Co. Continuous casting mold.

Harter, Isaac, Jr.: *See*—
Harter, Isaac, I. Harter, Jr., Ratcliffe, and Armstrong.

Hartford National Bank and Trust Co.: *See*—
Cluwen, Johannes M.
Mings, Garmt A.
Van Gelder, Geeswijn, and Vervest.
Warmolts, Nicolaas.

Hasenberg, Werner: *See*—
Kidd, Marshall C., and Hasenberg.

Hassan, Fauthal A.: *See*—
Hassan, Joseph A.

Hassan, Joseph A., ½ to F. A. Hassan. Voice coil for loud speakers.

Hauck, Paul A., to Hansen-Van Winkle-Munning Co. Transfer mechanisms.

Havens, Glenn G.: *See*—
Meanor, Doyle W., and Havens.

Hayes, James H. Overrunning clutch and one way brake with disabler for fishing reel.

Hayes, James H. One way brake.

Hayes, Marvin F., to T. W. Hallerberg. Indicator lamp housing.

Healy, James W. Toggle wrench.

Heimbuch, Elmer F., to Brummer Seal Co. Water cooled annular seal.

Hein, Harold W.: *See*—
Harstick, William H., Hododon, and Hein.

Heininger, Samuel A.: *See*—
Kosmin, Milton, and Heininger.

Heinrich, Leonard: *See*—
Granesay, Stephen V., and Heinrich.

Helbing, Clarence H., to Pittsburgh Plate Glass Co. Surfacing resin bodies.

Heil-Coil Corp.: *See*—
Forster, John O.

Heller, George L., to Columbian Carbon Co. Carbon black process and apparatus.

Henderson, Edward. Hypodermic syringe unit.

Hendrickson, Fritz E., to Norton Co. Abrasive polishing wheel and element.

Henn, Albert C.: *See*—
Rocca, Julius P., and Henn.

Hennies, Stuart R.: *See*—
Hagopian, Jacob J., and Hennies.

Hensley, Robert K., Jr. Cleaning depository.

Herlin, Melvin A.: *See*—
Hutchinson, Franklin, and Herlin.

Herman, Albert D., to Aeroquip Corp. Reinforced T shaped seal for flanged pipe coupling.

Hermann, Edward C., to E. I. du Pont de Nemours and Co. Carboxymethyl quaternary ammonium halides, hydrazides and hydrazones with thiophenecarbaxaldehydes.

Hermanson, Harry M., to Minneapolis-Honeywell Regulator Co. Fuel gage apparatus.

Hermeryd, Fritz O., A. F. Nord, and E. O. A. Sundström, to Boliidens Gruvaktiebolag. Smelting sulfide ores.

Herring Magic, Inc.: *See*—
Miller, Myron C.

Herscovitch, William. Conveyors or elevators for bulk material.

Herscovitch, William. Conveyors.

Hernagh, Frank, A. P. Wuchter, and W. J. Strong, to The B. F. Goodrich Co. Rubber tire valve assembly.

Hess Co., The: *See*—
Rzeszutko, Stanley J.

Hettick, George R., to Phillips Petroleum Co. Catalytic defluorination process.

Hevi Duty Electric Co.: *See*—
Frank, Arthur W.

Hewey, Robert W.: *See*—
Johnson, Edwin W., Donaldson, and Hewey.

Hewitt, Frederick G., to Burgess-Manning Co. Doorless telephone booth.

Hewlett-Packard Co.: *See*—
Bagley, Alan S.

Hill, Arlie D. Hand actuated pipe wall extrusion tool.

Hirsch, Abraham A. Articulated surface washing device with oscillatory nozzles for filter beds.

Hitchings, George H., and P. B. Russell, to Burroughs Wellcome & Co. (U. S. A.) Inc. Triazine compounds and method.

Hododon, Floyd G.: *See*—
Harstick, William H., Hododon, and Hein.

Hoecker, Albert C., to General Electric Co. Steam irons.

Hogg, John A.: *See*—
Schneider, William P., and Hogg.

Hoggren, Oscar C. Portable milk pasteurizer.

Holbrook, Orrin C.: *See*—
Moenning, William K., and Holbrook.

Holle, Otto E. Planter shoe.

Holley Carburetor Co.: *See*—
Sterner, Melvin F.

Hollyday, William C., Jr., to Esso Research and Engineering Co. Lubricating compositions.

Holmberg, Gustave D.: *See*—
Flowers, Ralph C., and Holmberg.

Holmes, Lloyd E. Internal pipe gripping tool.

Holmqvist, Gert E. O., B. E. Björklund, and A. K. Dietsch, to Telefonaktiebolaget L M Ericsson. Contact device for cross bar switches.

Honma, Minoru, to The State of Iowa, for the benefit of the State University of Iowa. Apparatus for spectrographic analysis.

Hooker, Harwood D.: *See*—
Harman, Gerald J., Hooker, and Rummel.
Harman, Gerald J., Hooker, and Rummel.

Horsfall, Robert B., Jr.: *See*—
Ostergren, Ralph H., Goldberg, Horsfall, and Wuerth.

Horton, William G. Display and like devices.

Horton, Winthrop S., and C. J. Lucia, to Studebaker-Packard Corp. Marine propulsion mechanism.

Houdry Process Corp.: *See*—
Milliken, Thomas H., Jr., and Koester.
Shabaker, Hubert A.

Huber, Theodore A., to Esso Research and Engineering Co. Apparatus for squeeze cementing well perforations.

Huddle, Edwin P.: *See*—
Carlson, Ernest C., and Huddle.
Oreling, John E., Huddle, and Uhm.

Hudson, H. D., Mfg. Co.: *See*—
Hudson, Robert C., and Pinks.

Hudson, Owen M.: *See*—
Allen, Howard G., and Hudson.

Hudson, Robert C. and A. H. Pinks, to H. D. Hudson Mfg. Co. Compression sprayer.

Hudson, Verne L., and J. M. Wickham, said Hudson assor. to Boeing Airplane Co. Aircraft flight refueling apparatus.

Hudson, William L. Periodic coin collector.

Huggins, John W.: *See*—
Thomas, Theron H., and Huggins.

Hughes, Ray C.: *See*—
Coppola, Patrick P., Hughes, and Koppius. 2,769,706.

Hughes Tool Co.: *See*—

Stein, Sidney J., and Pugh. 2,769,944.

International Steel Co.: *See*—
Nystrom, Karl F. 2,769,230.
Nystrom, Karl F. 2,769,405.

Irvine, Robert L., to Gulf Oil Corp. Process and apparatus for separating fluid mixtures. 2,769,309, 11–6–56, Cl. 62—2.

Isitt, John S.: *See*—
Porter, Frederick W. B., and Isitt. 2,769,756.
Porter, Frederick W. B., and Isitt. 2,769,758.

Isen, Joe A.: *See*—
Abboud, Harry I. 2,769,506.

Jackson, Forest W. Cleaning bag for dentures. 2,769,193, 11–6–56, Cl. 15—210.

Jackson, Percy: *See*—
Purdie, William H., and Jackson. 2,769,302.

Jacobson, Moses G., J. C. Gilfert, F. J. De Luca, and W. F. Mruk, to Mine Safety Appliances Co. Bolometer. 2,769,884, 11–6–56, Cl. 201—63.

James, Edwin E.: *See*—
Cottrell, Wayne W., and James. 2,769,360.

Jarvis, John, to Bendix Aviation Corp. Thermal time delay circuit. 2,769,955, 11–6–56, Cl. 323—69.

Jeffcock, George N., and A. E. Wagar, to Cluett, Peabody & Co., Inc. Method of making a cuff and attachment of same to a sleeve. 2,769,178, 11–6–56, Cl. 2—123.

Jen, Yun: *See*—
Suen, Tzeng J., and Jen. 2,769,796.
Suen, Tzeng J., and Jen. 2,769,797.
Suen, Tzeng J., and Jen. 2,769,799.
Suen, Tzeng J., and Jen. 2,769,800.

Jenks, Raymond L. Spring motor-operated fire alarm. 2,769,422, 11–6–56, Cl. 116—101.

Jennings, Uel P., and E. F. Lewis, to E. I. du Pont de Nemours and Co. Explosive cartridge end closure apparatus. 2,769,377, 11–6–56, Cl. 92—55.1.

Jensen, Louis P., and W. M. Wheildon, Jr., to Norton Co. Apparatus for coating articles with refractory oxides and the like. 2,769,663, 11–6–56, Cl. 299—22.5.

Jensen, Thormod, to American Machine and Foundry Co. Mixer. 2,769,622, 11–6–56, Cl. 259—8.

Jeoheem, Theodore B., to Cutler-Hammer, Inc. Mechanism for counting and stacking magazines and the like. 2,769,378, 11–6–56, Cl. 93—93.

John, Dorothy: *See*—
Becher, Frederick G. L. 2,769,710.

Johnson, Edwin W. T. M. Donaldson, and R. W. Hewey, to The Singer Mfg. Co. Lubricating devices for sewing machines. 2,769,418, 11–6–56, Cl. 112—256.

Johnson, Ewing L. Railway front end structures. 2,769,555, 11–6–56, Cl. 213—6.

Johnson Fare Box Co.: *See*—
Regler, Clarence F., Kulo, and Singer. 2,769,524.

Johnson, George R. Stall type rack. 2,769,559, 11–6–56, Cl. 214—16.1.

Johnson, John. Plastic cement applicator. 2,769,578, 11–6–56, Cl. 222—107.

Johnson, Ralph S.: *See*—
Dolan, John, Steinhagen, and Johnson. 2,769,660.

Johnson, Spencer: *See*—
Wetterau, Paul C., Bishop, and Johnson. 2,769,724.

Jones, Cecil B. Grinder. 2,769,281, 11–6–56, Cl. 51—91.

Jones, John P. Tree shakers. 2,769,298, 11–6–56, Cl. 56—328.

Joris, George G. to Allied Chemical & Dye Corp. Process for preparation of para-alpha-cumyl phenol. 2,769,844, 11–6–56, Cl. 260—619.

Joy, Joseph F., to Joy Mfg. Co. Loop cutter chain guide and drive structure. 2,769,627, 11–6–56, Cl. 262—33.

Joy, Joseph F., to Joy Mfg. Co. Mining machine cutter bit. 2,769,628, 11–6–56, Cl. 262—33.

Joy Mfg. Co.: *See*—
Joy, Joseph F. 2,769,627.
Joy, Joseph F. 2,769,628.

Juhasz, Stephen, to The Air Preheater Corp. Parallel and counterflow of air in preheater. 2,769,619, 11–6–56, Cl. 257—4.

Just, George A., to The Grand Union Co. Display and delivery stand. 2,769,551, 11–6–56, Cl. 211—49.

Juvinall, James W., to Rapaport Electro-Coating Corp. Apparatus for and method of conveying articles. 2,769,725, 11–6–56, Cl. 117—104.

Kairath, Howard G. Resiliently mounted hobby horse. 2,769,484, 11–6–56, Cl. 155—50.

Vacek, George J. Chopping device. 2,769,382, 11-6-56, Cl. 97—10.
Valverde, Patricio, Sr. Wall and ceiling cleaner. 2,769,673, 11-6-56, Cl. 306—11.
Van Deventer, Ralph E., to Studebaker-Packard Corp. Method of welding cylinder to head. 2,269,226, 11-6-56, Cl. 29—156.8.
Van de Zande, Lodewijk J. C. Process for fireproofing porous materials. 2,769,729, 11-6-56, Cl. 117—137.
Van Gelder, Gosewijn, and W. L. Vervaet, to Hartford National Bank and Trust Co., as trustee. High-frequency coil of the kind comprising a tapping which is displaceable by means of a screw spindle. 2,769,963, 11-6-56, Cl. 336—139.
Van Horn, Clarence R., and G. P. Pirwits, to Wollensak Optical Co. Lens cap. 2,769,364, 11-6-56, Cl. 88—1.
Vaniman, George H.: *See*—
Christensen, Carsten O., and Vaniman. 2,769,291.
Vansteenkiste, Alfred: *See*—
Vansteenkiste, Mary L. M. and A. 2,769,779.
Vansteenkiste, Mary L. M. and A. Water purifier for aquariums. 2,769,779, 11-6-56, Cl. 210—16.
Veldhuis, Benjamin: *See*—
Gilbert, Everett E., and Veldhuis. 2,769,836.
Vereinigte Armaturen-Gesellschaft m. b. H.: *See*—
Blankenagel, Heinrich, Ahls, and Eberseld. 2,769,609.
Vervest, Wilhelmus L.: *See*—
Van Gelder, Gosewijn, and Vervest. 2,769,963.
Vesco, Paul J. Automatic ignition control switch. 2,769,923, 11-6-56, Cl. 290—38.
Villars, Paul H.: *See*—
Bebert, Francis M., MacDonnell, and Villars. 2,769,883.
Vitus, Carlton J.: *See*—
Vitus, Maurice B., M. B. Vitus, Jr., and C. J. Vitus. 2,769,882.
Vitus, Maurice B., Jr.: *See*—
Vitus, Maurice B., M. B. Vitus, Jr., and C. J. Vitus. 2,769,882.
Vitus, Maurice B., M. B. Vitus, Jr., and C. J. Vitus. Electric switches. 2,769,882, 11-6-56, Cl. 200—168.
Volkoff, George M.: *See*—
Zosulin, Igor V., G. J. Okulitch, Volkoff, V. J. Okulitch, and Eliett. 2,769,932.
Von Hake, George W., and E. K. Wolf, to New Jersey Machine Corp. Box making machines. 2,769,561, 11-6-56, Cl. 216—58.
Von Sprecher, Hans: *See*—
Matter, Max, Roesl, and von Sprecher. 2,769,838.

Verdahl, Milton R., to Rem-Cru Titanium, Inc. Thermally stable beta alloys of titanium-tin alloys. 2,769,707, 11–6–56, Cl. 75—175.5.

Wade, R. M., & Co.: *See*—
Cornelius, Gail. 2,769,664.

Waechter, Charles J.: *See*—
Pomper, Anthony W., and Waechter. 2,769,495.

Wagar, Albert M.: *See*—
Jeffcock, George N., and Wagar. 2,769,178.

Wagner, Arthur J.: *See*—
Lagemann, George H. 2,769,581.

Wagner, John C., to International Harvester Co. Bumper, radiator, and grille assembly for sectional vehicle cab. 2,769,501, 11–6–56, Cl. 180—68.

Wagner, John C., to International Harvester Co. Pivotally mounted fender for cab-over-engine vehicles. 2,769,503, 11–6–56, Cl. 180—89.

Waldren, John, Corp.: *See*—
Pomper, Anthony W., and Waechter. 2,769,495.

Walker, James D., to B-I-F Industries, Inc. Continuous silica sol apparatus. 2,769,785, 11–6–56, Cl. 252—359.

Walter, Joseph H.: *See*—
Chidsey, Francis A., Jr., and Walter. 2,769,376.

Wallmannsberger, Georg. Electrical trip means for stopping passenger cable railways. 2,769,400, 11–6–56, Cl. 104—202.

Wamser, Carl H., to Everbrite Electric Signs, Inc. Illuminated signs. 2,769,263, 11–6–56, Cl. 40—132.

Ward, Irving A.: *See*—
Bletcher, Ralph E., and Ward. 2,769,454.

Warmoltz, Nicolaas, to Hartford National Bank and Trust Co., as trustee. Mass spectrometer for analysing substances or indicating a small amount of a determined substance. 2,769,911, 11–6–56, Cl. 250—41.9.

Warne, Eugene H.: *See*—
Harris, Thomas A., Lawrence, and Warne. 2,769,488.

Warren, Glenn W.: *See*—
Dylewski, Stanley W., Dulude, and Warren. 2,769,841.

Warren, S. D., Co.: *See*—
Hart, Robert T. 2,769,725.

Wassell, Frank L. and G. W. Tree balling device. 2,769,278, 11–6–56, Cl. 47—37.

Wassell, George W.: *See*—
Wassell, Frank L. and G. W. 2,769,278.

Watson, Robert G.: *See*—
Stone, Leonard R., Watson, and Carleton. 2,769,945.

Watts, Raymond, to American Steel Foundries. Anti wheel slip device. 2,769,509, 11–6–56, Cl. 188—1.

Weber, Oscar, to Ciba Ltd. Disazo-dyestuffs. 2,769,806, 11–6–56, Cl. 260—182.

Webster, W. F., Cement Co.: *See*—
Stevens, Frank L. 2,769,207.
Stevens, Frank L. 2,769,576.

Wedger, Walter H., to B. B. Chemical Co. Methods of making shoes. 2,769,168, 11–6–56, Cl. 12—142.

Weikart, John: *See*—
Sweetser, Sumner B., and Weikart. 2,769,754.

Weil, Ira, to Diamond Alkali Co. Production of phenoxy acid esters through the potassium phenolate. 2,769,833, 11–6–56, Cl. 260—473.

Weil, Nicholas A., to The M. W. Kellogg Co. Insulated skirt supported vessels. 2,769,563, 11–6–56, Cl. 220—9.

Weinstein, Albert. Musical devices. 2,769,362, 11–6–56, Cl. 84—97.

Weisheit, Charles. Shovel with lifting means. 2,769,612, 11–6–56, Cl. 254—131.5.

Wells, Stanley V. Mason's corner gauge. 2,769,240, 11–6–56, Cl. 33—65.

Westinghouse Air Brake Co.: *See*—
Dodd, Arthur E. 2,769,901.

Westinghouse Electric Corp.: *See*—
Harrison, John W. 2,769,891.

Weston Electrical Instrument Corp.: *See*—
Bistoppey, Reyden F. 2,769,959.

Wetterau, Paul C., J. Biskup, and S. Johnson, to Congoleum-Nairn Inc. Flexible hard surface covering and process of preparing same. 2,769,726, 11–6–56, Cl. 117—76.

Wever, Rütger: *See*—
Loeschcke, Hans, and Wever. 2,769,365.

Wheeler, Harold A.: *See*—
Harrold, Marshall C., and Wheeler. 2,769,312.

Wheeler, Harold A., to General Motors Corp. Window mounted refrigerating apparatus. 2,769,314, 11–6–56, Cl. 62—6.

Wheeling Steel Corp.: *See*—
Stanley, Lesli O. 2,769,424.

Whelldon, William M., Jr.: *See*—
Jensen, Louis P., and Whelldon. 2,769,663.

Whirlpool-Seeger Corp.: *See*—
Alsing, Carl F. 2,769,319.
Duncan, Thomas W. 2,769,311.
Kuhlenschmidt, Donald, and Fowler. 2,769,320.

Whitman, Hyman L., deceased, by T. I. Whitman, administratrix, to The B. F. Goodrich Co. Foot corrective member. 2,769,253, 11–6–56, Cl. 36—71.

Whitman, Tina I.: *See*—
Whitman, Hyman L. 2,769,253.

Wickham, James M.: *See*—
Hudson, Verne L., and Wickham. 2,769,604.

Wilckens, Bibe A., to Crown Cork & Seal Co., Inc. Closure cap element feeding apparatus. 2,769,419, 11–6–56, Cl. 113—114.

Wilhelm, Lucien C.: *See*—
Tareau, Georges H., and Wilhelm. 2,769,180.

Williams, Charles R., to Northrop Aircraft, Inc. Read-out tube circuit. 2,769,939, 11–6–56, Cl. 315—232.

Williams, Frederic C., and T. Kilburn, to National Research Development Corp. Electronic digital computers. 2,769,935, 11–6–56, Cl. 315—30.

Williams, Ivy L. Spreader for fishhooks. 2,769,270, 11–6–56, Cl. 43—42.74.

Williamson, John F., to Imperial Chemical Industries Ltd. Compositions for use in re-utilisable blasting apparatus. 2,769,701, 11–6–56, Cl. 52—14.

Wilson, Lucius H., to American Cyanamid Co. Deposition of tacky impregnating agents on cellulosic fibers. 2,769,711, 11–6–56, Cl. 92—21.

Wilson, Lucius H., to American Cyanamid Co. Manufacture of leather sheets containing normally tacky impregnating agents. 2,769,712, 11–6–56, Cl. 92—21.

Wilson, Lucius H., to American Cyanamid Co. Method of making asbestos paper containing a tacky bonding agent. 2,769,713, 11–6–56, Cl. 92—21.

Wintemberg, Adelbert C., to General Steel Castings Corp. Railway truck. 2,769,401, 11–6–56, Cl. 105—59.

Wirz, A. H., Inc.: *See*—
Darlington, Henry S., Jr. 2,769,583.

Wiseman, Joseph H. File cabinets. 2,769,679, 11–6–56, Cl. 312—350.

Wiseman, Reuben E., to The Minster Machine Co. Cabinet type press leg. 2,769,389, 11–6–56, Cl. 100—231.

Witt, Charlie H. Control for mechanisms. 2,769,532, 11–6–56, Cl. 198—222.

Wittenberg, Edward H., to National Presto Industries Inc. Combined venting and overpressure release valve. 2,769,457, 11–6–56, Cl. 137—512.

Witzky, Julius E.: *See*—
Lucia, Carroll J., and Witzky. 2,769,303.

Witzky, Julius E., to Studebaker-Packard Corp. Overhead valve arrangement for engines. 2,769,434, 11–6–56, Cl. 123—59.

Witzky, Julius E., to Studebaker-Packard Corp. Cylinder head retainer. 2,769,435, 11–6–56, Cl. 123—193.

Wolf, Edwin K.: *See*—
Von Hofe, George W., and Wolf. 2,769,561.

Wollensak Optical Co.: *See*—
Cook, Alan A., and Gilkeson. 2,769,372.
Gilkeson, David C. 2,769,371.
Van Horn, Clarence R., and Pirwitz. 2,769,364.

Wolters, Carl F., to Sperry Rand Corp. Insulated ledger desk. 2,769,678, 11–6–56, Cl. 312—310.

Wood, Hugh, & Co. Ltd.: *See*—
Donaldson, George, and Nordmann. 2,769,973.

Wood, Wallace H., to Norton Co. Grinding machine-taper control. 2,769,282, 11–6–56, Cl. 51—95.

Wood, William M. Vulcanizing mold having an adjustable core. 2,769,203, 11–6–56, Cl. 18—40.

Woods, Henry B.: *See*—
Morian, Erwin A., and Woods. 2,769,616.

Wooldridge, Mack, to American Tractor Equipment Corp. Swingable mount for ripper blade. 2,769,625, 11–6–56, Cl. 262—8.

Wright, Edward P., to Chicago Railway Equipment Co. Railway refrigerator car door. 2,769,214, 11–6–56, Cl. 20—23.

Wright, Jacob J., ½ to J. D. Aaron. Rotary snowplow. 2,769,254, 11–6–56, Cl. 37—21.

Wuchter, Albert P.: *See*—
Herzegh, Frank, Wuchter, and Strong. 2,769,476.

Wuerth, John M.: *See*—
Ostergren, Ralph H., Goldberg, Horstall, and Wuerth. 2,769,492.

Wuhrmann, Walter. Miter box with swinging saw guide. 2,769,467, 11–6–56, Cl. 143—89.

Yoder Co., The: *See*—
Abel, Paul J. 2,769,888.

Yoho, Clayton W., to Stoner-Mudge, Inc. Isocyanate-castor oil metal cement. 2,769,828, 11–6–56, Cl. 260—407.

Young, David W., and D. L. Cottle, to Esso Research and Engineering Co. Alkylated phenols and stabilized compositions comprising same. 2,769,784, 11–6–56, Cl. 252—52.

Young, Fred W., to S. N. Goldman. Collapsing seat for nesting carriers. 2,769,645, 11–6–56, Cl. 280—33.99.

Young, James L. Portable pipe beveling apparatus. 2,769,234, 11–6–56, Cl. 30—97.

Zamboni, Paul, to Landis & Gyr A. G. Integrating mechanism. 2,769,591, 11–6–56, Cl. 235—61.

Zeal, Victor. Shaft sinking machine. 2,769,614, 11–6–56, Cl. 255—4.8.

Zenith Radio Corp.: *See*—
Bridges, Jack E. 2,769,854.

Zibell, William H., and H. J. Forest, to Forbell Corp. Process of improving the properties of heat resistant alloys. 2,769,736, 11–6–56, Cl. 148—3.

Zimmermann, Joseph J., to The Electronic Secretary, Inc. Power supply switching circuit. 2,769,939, 11–6–56, Cl. 179—6.

Zimmermann, Joseph J., to The Electronic Secretary, Inc. Timing and holding apparatus. 2,769,940, 11–6–56, Cl. 179—8.

Zinamon, Martin, E. F. Semlitz, and J. Lavin. Method of permanently pleating fabrics. 2,769,584, 11–6–56, Cl. 223—30.

Ziskal, Joseph F., to International Harvester Co. Hydraulic power steering mechanism for vehicles. 2,769,562, 11–6–56, Cl. 180—79.2.

Zito, Ralph, Jr., and F. S. Dellenbaugh, III, to General Precision Laboratory Inc. Comparator. 2,769,657, 11–6–56, Cl. 324—57.

Zoralla, Igor V., G. J. Okulitch, G. M. Voltoff, V. J. Okulitch, and A. J. Ellett, to Toronto Transformer Ltd. Magnetic couplings. 2,769,822, 11–6–56, Cl. 310—105.

Zuercher, John, to American Machine & Foundry Co. Distributor mechanism for bowling pin spotting machines. 2,769,637, 11–6–56, Cl. 273—43.

# CLASSIFICATION OF PATENTS

## ISSUED NOVEMBER 6, 1956

NOTE.—First number—class, second number—subclass, third number—patent number

220— 100: 2,700,577
107: 2,700,578
170: 2,700,579
207: 2,700,580
466: 2,700,581
515: 2,700,582
541: 2,700,583
572: 2,700,584

The TRADEMARK SECTION of the OFFICIAL GAZETTE, issued weekly, is mailed under the direction of the Superintendent of Documents, Government Printing Office, Washington 25, D. C., to whom all subscriptions should be made payable and all communications addressed; subscription price, $10.00 per annum, foreign mailing $2.50 additional; single copies, 20 cents each.

# MARKS PUBLISHED FOR OPPOSITION

The following marks are published in compliance with section 12(a) of the Trademark Act of 1946. Notice of opposition under section 13 may be filed within thirty days of this publication. See Rules 20.1 to 20.5.

As provided by section 31 of said act, a fee of twenty-five dollars must accompany each notice of opposition.

## CLASS 1

### RAW OR PARTLY PREPARED MATERIALS

SN 274. Vaughan's Seed Company, Chicago, Ill. Filed Jan. 6, 1956.

**MASTER BLEND**

The word "Blend" is disclaimed apart from the mark as shown.

For Flower Seeds, Vegetable Seeds, and Bulbs.
First use Jan. 1, 1953.

SN 896. Mud Control Laboratories, Inc., Oklahoma City, Okla. Filed Jan. 17, 1956.

**CONTROLBAR**

For Oil Well Drilling Fluid Additives—Namely, Ground Barytes Which Increase the Weight of Drilling Muds.
First use 1950.

SN 898. Mud Control Laboratories, Inc., Oklahoma City, Okla. Filed Jan. 17, 1956.

**CONTROLFIBER**

For Oil Well Drilling Fluid Additives—Namely, Blended Materials of a Spongy and Flocculent Character.
First use 1951.

SN 1,391. Pollak Industrial Corporation, Stratford, Conn. Filed Jan. 24, 1956.

ARNAR PLASTIC

The word "Plastic" is disclaimed apart from the mark as shown.

For Plastic Film and Sheeting and Plastic Products, More Particularly Sheet Plastic Formed of Polyvinyl Chloride, Polyvinyl Chloride-Acetate, Co-Polymers, and Polyethylene.
First use Jan. 4, 1956.

SN 6,389. F. H. Woodruff & Sons, Inc., Milford, Conn. Filed Apr. 13, 1956.

Woodruff SEEDS

The word "Seeds" is disclaimed apart from the mark as shown.

For Seeds, Particularly Vegetable Seeds, Flower Seeds, Grass Seeds, and Grass Seed Mixtures.
First use about January 1948.

SN 7,105. Northrup, King & Co., Minneapolis, Minn. Filed Apr. 25, 1956.

**CHERRY SUNDAE**

For Zinnia Seeds.
First use Mar. 1, 1956.

SN 7,271. Nichols Poultry Farm, Inc., Kingston, N. H. Filed Apr. 27, 1956.

For Hatching Eggs and Day Old Chicks.
First use in June 1955.

SN 7,616. Midwest Plastic Products Company, Chicago Heights, Ill. Filed May 3, 1956.

**MIDLON**

For Extruded Synthetic Plastic Sheets and Tubes.
First use Dec. 24, 1953.

SN 7,868. Superior Tanning Company, Chicago, Ill. Filed May 7, 1956.

**ALMANAC**

For Leather Made From Cattlehides and Horsehides.
First use Aug. 1, 1954.

SN 7,870. Superior Tanning Company, Chicago, Ill. Filed May 7, 1956.

**KODIAK**

For Leather Made From Cattlehides and Horsehides.
First use Apr. 2, 1956.

SN 7,920. Fine Foods, Inc., Seattle, Wash. Filed May 8, 1956.

**SUN GIRL**

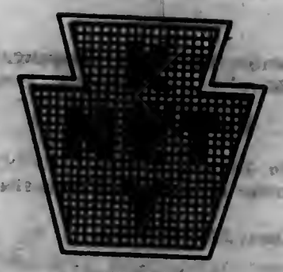
For Plants, Flowers, and Bulbs.
First use March 1955.

SN 7,996. J. & L. Adiks, Inc., Jamaica, N. Y. Filed May 9, 1956.

**GRO-WELL**

For Grass Seed.
First use July 1, 1932.

## CLASS 2



### RECEPTACLES

SN 7,506. International Molded Plastics, Inc., Cleveland, Ohio. Filed May 2, 1956.

ARROWHEAD

Owner of Reg. No. 552,692.
For Plastic Dinner Dish Ware.
First use May 1, 1952.

SN 8,230. Keystone Casing Supply Company, Carnegie, Pa. Filed May 14, 1956.

For Tubular Netted Fabric Enclosures for Sausage Casings.
First use Mar. 9, 1956.

SN 8,231. Keystone Casing Supply Company, Carnegie, Pa. Filed May 14, 1956.

**KEYNET**

For Tubular Netted Fabric Enclosures for Sausage Casings.
First use Mar. 9, 1956.

SN 8,896. Dalmine S. p. A., Milan, Italy. Filed Apr. 30, 1956.

**DALMINE**

Owner of Italian Reg. No. 121,993, dated Mar. 16, 1955.
For Receptacles—Namely, Pressure Tanks and Bottles.

SN 8,904. Dalmine S. p. A., Milan, Italy. Filed Apr. 30, 1956.

Owner of Italian Reg. No. 109,706, dated Feb. 16, 1951.
For Receptacles—Namely, Pressure Tanks and Bottles.

SN 8,908. Dalmine S. p. A., Milan, Italy. Filed Apr. 30, 1956.

Owner of Italian Reg. No. 99,025, dated Nov. 18, 1950.
For Receptacles—Namely, Pressure Tanks and Bottles.

## CLASS 3

### BAGGAGE, ANIMAL EQUIPMENTS, PORTFOLIOS, AND POCKETBOOKS

SN 12,384. Ronay, Inc., New York, N. Y. Filed July 18, 1956.

**Endura**

For Ladies' Handbags, Made of Plastic Fabric.
First use June 11, 1956.

SN 12,407. Abraham Boretz, New York, N. Y. Filed July 19, 1956.

EVEREDGE

For Suitcases for Men.
First use Mar. 1, 1956.

SN 12,652. Nash Inc., Jersey City, N. J. Filed July 23, 1956.

**"DINGLE-DANGLE"**

For Wallets and Billfolds.
First use Mar. 6, 1956.

SN 13,242. Julius Resnick, Inc., New York, N. Y. Filed Aug. 1, 1956.

**JR**

For Ladies' Handbags and Purses.
First use Aug. 25, 1955.

## CLASS 4

### ABRASIVES AND POLISHING MATERIALS

SN 699,287. Bev-Rich Products, Inc., Philadelphia, Pa. Filed Dec. 2, 1955.

**FORMULA X-10**

No claim is made to the word "Formula" apart from the mark as shown.
For Automobile Polish.
First use October 1947.

SN 7,066. Cadie Chemical Products, Inc., New York, N. Y. Filed Apr. 25, 1956.

**LUSTRE-DUSTER**

For Chemically Impregnated Dusting and Polishing Cloths.
First use Jan. 25, 1956.

SN 7,067. Cadie Chemical Products, Inc., New York, N. Y. Filed Apr. 25, 1956.

**RE-LAC**

For Chemically Impregnated Dusting and Polishing Cloths.
First use Jan. 25, 1956.

SN 7,152. The Betco Corporation, Toledo, Ohio. Filed Apr. 26, 1956.

**BETCO BRITE**

For Floor Wax.
First use Apr. 10, 1956.

SN 7,237. Lodge Plugs Limited, Rugby, England. Filed Apr. 27, 1956.

**SINTOX**

Owner of British Reg. No. 687,904, dated Apr. 6, 1950; and U. S. Reg. No. 370,078.
For Abrasive Preparations of Alumina, Grinding Wheels, Sharpening Stones, Sharpening Wheels, Cutting Devices and Lapping Devices, All Being Parts of Machines.

## CLASS 5

### ADHESIVES

SN 7,182. The Firestone Tire & Rubber Company, Akron, Ohio. Filed Apr. 26, 1956.

*Loxite*

Owner of Reg. Nos. 520,826 and 442,487.
For Adhesive Cement To Be Used in Adhering Plastics, Wood, Fabrics, Leather, Paper, Glass, Metal, Ceramics, Metal Foil, Rubber, and Upholstery.
First use Dec. 18, 1947.

## CLASS 6

### CHEMICALS AND CHEMICAL COMPOSITIONS

SN 631,873. John Wiley Jones, d. b. a. John Wiley Jones Co., Caledonia, N. Y. Filed June 27, 1952.

Owner of Reg. No. 296,856.
For Sodium Hypochlorite and Liquid Chlorine for Industrial Use and Household Bleach.
First use Dec. 1, 1950; Apr. 6, 1932, as to "Sunny Sol" and the representation of the sun.

SN 694,301. Bromine Producers Company, Adrian, Mich. Filed Sept. 7, 1955.

**BROM 55**

Owner of Reg. No. 594,113.
For Bromine Carrier Products for Use in the General Industrial Arts.
First use in or about January 1953.

SN 695,015. Panogen, Inc., Ringwood, Ill. Filed Sept. 20, 1955.

**PANO-DRENCH**

The word "Drench" is disclaimed apart from the mark as shown.
For Soil Drench.
First use Jan. 24, 1955.

SN 695,899. E. I. du Pont de Nemours and Company, Wilmington, Del. Filed Oct. 5, 1955.

**SHIRLAN**

Owner of Reg. No. 305,724.
For Chemical Compounds Having Bacteriostatic and/or Fungicidal Properties.
First use May 12, 1955.

SN 695,900. E. I. du Pont de Nemours and Company, Wilmington, Del. Filed Oct. 5, 1955.

**ZONIUM**

Owner of Reg. No. 592,940.
For Chemical Compounds or Compositions for Protecting Materials From Tarnishing or Corrosion.
First use July 12, 1955.

SN 699,733. Metalloid Industrial Service, Inc., New York, N. Y. Filed Dec. 9, 1955. Sec. 2(f).

**METALLOID**

For Soluble Heat Retardant Compounds Used in Metal Cutting and Grinding Operations.
First use Dec. 15, 1949.

SN 700,479. Reichhold Chemicals, Inc., Detroit, Mich. Filed Dec. 22, 1955.

**REZAMUL**

Owner of Reg. Nos. 528,464, 568,070, and 579,774.
For Emulsified Synthetic Resins.
First use Dec. 9, 1955.

SN 700,585. Diamond Alkali Company, Cleveland, Ohio. Filed Dec. 27, 1955.

**TYRENE**

For Dye Assistant.
First use Dec. 9, 1955.

SN 678. Hydroponic Chemical Company, Inc., Copley, Ohio. Filed Jan. 13, 1956.

**NIBONEX**

For Rabbit Repellent.
First use Dec. 2, 1955.

SN 1,126. Benjamin D. Smith, d. b. a. American Manufacturing Company, Whitesboro, N. Y. Filed Jan. 19, 1956.

**AM-CO**

For Rodenticides.
First use on or before Mar. 30, 1955.

SN 1,244. International Biochemical Corporation, Brooklyn, N. Y. Filed Jan. 23, 1956.

**BIOSTAN**

The drawing is lined for red.
For Bovine Blood Serum Ultrafiltrate for Biochemical Standardisation for Laboratory Use Only.
First use on or about Aug. 15, 1955.

SN 3,746. Geigy Chemical Corporation, Ardsley, N. Y. Filed Mar. 2, 1956.

**MAXICRON**

For Dyes and Dyestuffs.
First use Feb. 13, 1956.

SN 3,747. Geigy Chemical Corporation, Ardsley, N. Y. Filed Mar. 2, 1956.

**MAXILON**

For Dyes and Dyestuffs.
First use Feb. 13, 1956.

SN 6,558. Rigo Manufacturing Co., Inc., Nashville, Tenn. Filed Apr. 17, 1956.

**Pinegard**

For Disinfectant and Deodorant.
First use Jan. 2, 1953.

## CLASS 8

### SMOKERS' ARTICLES, NOT INCLUDING TOBACCO PRODUCTS

SN 10,670. Elgin American, Inc., Elgin, Ill. Filed June 21, 1956.

**UNIMATIC**

For Cigarette Lighters and the Operating Mechanism Therefor.
First use Apr. 30, 1956.

SN 11,397. Park Sherman Company, Chicago, Ill. Filed July 2, 1956.

**PARK AVENUE**

For Ash Trays, Cigarette Boxes and Cases, Pipe Racks.
First use January 1956.

## CLASS 9

### EXPLOSIVES, FIREARMS, EQUIPMENTS, AND PROJECTILES

SN 10,431. Horning-Cooper, Incorporated, Monrovia, Calif. Filed June 18, 1956.

**ASP**

For Atmospheric Sounding Projectile or Rocket.
First use Dec. 21, 1955.

## CLASS 10

### FERTILIZERS

SN 698,900. N'Land Industries, Inc., Lewiston, Idaho. Filed Nov. 25, 1955.

**AQUALIZER**

For Fertilizer Comprised of Agricultural Grade Aqueous Ammonia.
First use Apr. 11, 1954.

SN 9,967. Escambia Bay Chemical Corp., Pensacola, Fla. Filed June 11, 1956.

**BAY-SOL**

For Nitrogen Solutions for Fertilizers.
First use Oct. 14, 1955.

SN 9,968. Escambia Bay Chemical Corp., Pensacola, Fla. Filed June 11, 1956.

**AMMO-NITE**

For Fertilizer.
First use Oct. 21, 1955.

SN 12,854. Standard Oil Company of California, San Francisco, Calif. Filed Aug. 14, 1956.

Owner of Reg. Nos. 356,109, 533,798, and others.
For Fertilizers, Soil Conditioners, Soil Amendments, Soil Correctives, Chemical Preparations To Prevent Premature Dropping of Fruits and Vegetables From Trees and Plants, and Plant Hormones.
First use June 25, 1956.

CLASS 11

INKS AND INKING MATERIALS

SN 9,420. Addressograph-Multigraph Corporation, Cleveland, Ohio. Filed June 1, 1956.

MULTILITH

Owner of Reg. Nos. 305,209, 612,565, and others.
For Printing Ink, Carbon Paper, Inked Ribbons, and Writing Fluid.
First use Jan. 10, 1933.

CLASS 12

CONSTRUCTION MATERIALS

SN 681,469. Southwestern Petroleum Co., Inc., d. b. a. The Zone Co., Fort Worth, Tex. Filed Jan. 25, 1955.

ZONE

Owner of Reg. Nos. 370,377 and 370,201.
For Liquid Asbestos Roof Coating and Plastic Roof Cement.
First use Nov. 9, 1936.

CLASS 13

HARDWARE AND PLUMBING AND STEAM-FITTING SUPPLIES

SN 9,623. American Tack Co., Inc., New York, N. Y. Filed June 5, 1956.

ROLL-A-GLIDE

For Ball Bearing Casters.
First use Mar. 19, 1956.

SN 9,696. Thomas S. Becher, d. b. a. Win-Door Co., Laconia, N. H. Filed June 6, 1956.

CRASH BAR

For Metal Bar Which Extends Across Screen and Storm Doors and Is Used for Pushing Them Open.
First use April 1955.

CLASS 15

OILS AND GREASES

SN 692,340. Mid-West Oil Company, Kansas City, Kans. Filed Aug. 2, 1955. Sec. 2(f).

Dependable BRAND MOTOR OIL

Exclusive use of the words "Brand Motor Oil" is not claimed apart from the mark as shown.
For Motor Oil.
First use January 1932.

SN 696,910. Sayer Refining Company, Inc., Oklahoma City, Okla. Filed Oct. 21, 1955.

STAY-READY

For Motor Oil for Automobile Motors.
First use Nov. 1, 1949.

SN 700,933. Paragon Oil Company, Incorporated, Long Island City, N. Y. Filed Dec. 27, 1955.

paragon Oil

The words "Oil, Oil Burners, Heating Oils" are disclaimed apart from the mark as shown. Owner of Reg. No. 554,157.
For Gasoline and Petroleum Lubricating Oils.
First use Apr. 1, 1925.

SN 700,935. Parason Oil Company, Inc., Long Island City, N. Y. Filed Dec. 27, 1955.

paragon Oil

The word "Oil" is disclaimed apart from the mark as shown. Owner of Reg. No. 554,157.
For Gasoline and Petroleum Lubricating Oils.
First use April 1925.

SN 9,809. S. A. R. O. M. Societa Azionaria Raffinazione Olii Minerali, Milan, Italy. Filed June 8, 1956.

S. A. R. O. M.

Owner of Italian Reg. No. 113,532, dated Sept. 30, 1953.
For Motor Fuels, Diesel Oil, Gas Oil, Kerosene, Stove Oil.

SN 10,808. Shell Oil Company, New York, N. Y. Filed June 22, 1956.

DIALA

For Lubricating Oil.
First use Sept. 9, 1946.

SN 10,809. Shell Oil Company, New York, N. Y. Filed June 22, 1956.

FUSUS

For Lubricating Oil.
First use Feb. 1, 1948.

SN 10,810. Shell Oil Company, New York, N. Y. Filed June 22, 1956.

MACOMA

For Lubricating Oil.
First use Sept. 15, 1948.

SN 10,811. Shell Oil Company, New York, N. Y. Filed June 22, 1956.

CARNEA

For Lubricating Oil.
First use Jan. 29, 1930.

SN 10,812. Shell Oil Company, New York, N. Y. Filed June 22, 1956.

LIMEA

For Lubricating Oil.
First use Feb. 1, 1948.

SN 10,813. Shell Oil Company, New York, N. Y. Filed June 22, 1956.

GARIA

For Lubricating Oil.
First use Sept. 1, 1941.

SN 11,042. Manuel Muntanola Tey, Barcelona, Spain. Filed June 26, 1956.

CERJADE

Owner of Spanish Reg. No. 288,445, dated Mar. 24, 1955.
For Plain and Decorated Candles.

SN 11,071. Gaspard & Sons Limited, Winnipeg, Manitoba, Canada. Filed June 27, 1956.

ETERNALITE

Owner of Canadian Reg. No. N. S. 48,534, dated Dec. 31, 1953.
For Church Candles.

SN 11,267. Kiekhaefer Corporation, Cedarburg, Wis. Filed June 29, 1956.

QUICKSILVER

Owner of Reg. Nos. 565,610 and 611,763.
For Oil.
First use May 2, 1956

CLASS 16

PROTECTIVE AND DECORATIVE COATINGS

SN 7,107. The Pennsylvania Salt Manufacturing Company, Philadelphia, Pa. Filed Apr. 25, 1956.

NEOFLOOR

For Kits Containing Resilient Coating Material and Grit for Preparing Protective Coatings Having a Grit Embedded Therein.
First use May 6, 1954.

CLASS 17

TOBACCO PRODUCTS

SN 5,533. Kraemer Stores, Inc., Toledo, Ohio. Filed Mar. 30, 1956.

Lord Kenyon

Owner of Reg. No. 343,083.
For Smoking Tobacco, Primarily for Pipes, and Cigars.
First use Mar. 1, 1936.

SN 10,656. Casa Cuba Cigar Factory, d. b. a. Casa Cuba Cigar Co., Tampa, Fla. Filed June 21, 1956. Sec. 2(f).

Casa Cuba

For Cigars.
First use Oct. 23, 1944.

SN 11,488. Larus & Brother Company, Richmond, Va. Filed July 3, 1956.

KEG

Owner of Reg. No. 333,030.
For Smoking Tobacco and Cigarettes.
First use Oct. 3, 1935.

CLASS 18

MEDICINES AND PHARMACEUTICAL PREPARATIONS

SN 675,141. General Health Corporation, Camden, N. J. Filed Oct. 20, 1954.

PIKup

For Vitamin Preparations in Liquid and Tablet Form for Human Use.
First use on or about July 19, 1954.

SN 683,217. The Upjohn Company, Kalamazoo, Mich. Filed Aug. 16, 1955.

**Parvex**

For Anthelmintic Preparation for Veterinary Use.
First use May 9, 1955.

SN 694,662. Mildred Benyo, d. b. a. Physio Appliance Co., Cudahy, Wis. Filed Sept. 12, 1955.

**VITA TISSUE**

For Medicated Lotion or Liniment for the Treatment of Hernia or Rupture and Muscular Aches and Pains or Stiff Joints.
First use June 25, 1955.

SN 694,585. Meyer Chemical Company, Detroit, Mich., now by change of name Meyer and Company. Filed Sept. 13, 1955.

**ALMETHINE**

For Antispasmodic Capsule, for the Treatment of Gastro-Intestinal Spasm and Hyperchlorhydria.
First use Nov. 15, 1954.

SN 694,587. Meyer Chemical Company, Detroit, Mich., now by change of name Meyer and Company. Filed Sept. 13, 1955.

**HISTALME**

For Antihistamine, Antisecretory, and Antispasmodic Capsule: Used for the Symptomatic Treatment of Hay Fever, Urticaria, Vasomotor Rhinitis, and Other Conditions Induced by Histamine.
First use June 6, 1955.

SN 697,786. Gane and Ingram, Incorporated, New York, N. Y. Filed Nov. 7, 1955.

**CALMITOL**

For Medicated Pharmaceutical Preparation for the Relief of Itching Skin.
First use August 1922.

SN 697,925. The Norwich Pharmacal Company, d. b. a. Eaton Laboratories, Norwich, N. Y. Filed Nov. 8, 1955.

**ENTEFUR**

For Antibacterial Preparation for Veterinary Use.
First use Oct. 17, 1955.

SN 700,404. The Upjohn Company, Kalamazoo, Mich. Filed Dec. 21, 1955.

**FILIN**

For Antibiotics for Antifungal Use.
First use Sept. 14, 1955.

SN 1,316. Anchor Serum Co. of Indiana, Inc., Indianapolis, Ind. Filed Jan. 24, 1956.

**FORAGE-FEEN**

For Anthelmintic for Removing Internal Parasites From Livestock Comprising Flavored Phenothiazine.

### Vacation of Order of Cancellation

The order of cancellation dated September 21, 1956, cancelling Registration No. 527,502, was inadvertently entered and has been vacated.

## REGISTRATIONS PUBLISHED UNDER SEC. 12(c)

The following marks registered under the act of 1905, or the act of 1881, are published under the provisions of section 12(c) of the Trademark Act of 1946. These registrations are not subject to opposition but are subject to cancellation under section 14 of the act of 1946.

### CLASS 6

### CHEMICALS AND CHEMICAL COMPOSITIONS

340,312. Nov. 3, 1936. Superior Chemical Products, Inc., Philadelphia, Pa. Pub. by registrant.

OMNICIDE

For Insecticide.

### CLASS 12

### CONSTRUCTION MATERIALS

289,773. Dec. 8, 1931. The Mosaic Tile Company, Zanesville, Ohio. Pub. by registrant.

VELVETEX FLOOR TILE

For Floor and Wall Tiles of Baked Clay.

338,166. Sept. 1, 1936. Republic Steel Corporation, Cleveland, Ohio. Pub. by The Superock Company, Wilmington, Del.

SUPEROCK

For By-Products of Blast Furnaces—Namely, Crushed Slag for Use as an Aggregate for Cement or Concrete.

397,331. Sept. 1, 1942. X-Pando Corporation, Long Island City, N. Y. Pub. by registrant.

X-PANDOSEAL

For Transparent Liquid Coating Materials for Waterproofing and Dampproofing Plaster, Masonry, Tile and the Like, Wood, Linoleum, Leather, Paper, Fabric and the Like; and for Coating Materials Preventing the Dusting of Concrete Floors.

### CLASS 18

### MEDICINES AND PHARMACEUTICAL PREPARATIONS

340,183. Nov. 3, 1936. Naamloose Vennootschap Drogerijen Maatschappij, Rotterdam, Netherlands. Pub. by Harold Ritchie, Inc., Clifton, N. J.

Silvikrin

For Medicinal and Cosmetic Products for Dressing Hair and Treating Hair, for Promoting the Growth of Hair, and for Curing and Healing Diseases of Hair, Scalp, and Skin.

### CLASS 21

### ELECTRICAL APPARATUS, MACHINES, AND SUPPLIES

354,911. Mar. 1, 1938. Frank McCall, Los Angeles, Calif. Pub. by Joseph Chiarello, Los Angeles, Calif.

DESERT-AIR

For Electric Lamps.

### CLASS 28

### JEWELRY AND PRECIOUS-METAL WARE

430,017. June 3, 1947. Oneida Ltd., Oneida, N. Y. Pub. by registrant.

TOGETHER

For Silverplated Flat and Hollowware and Cutlery.

### CLASS 32

### FURNITURE AND UPHOLSTERY

361,334. Oct. 11, 1936. The Elias Glass Company, Hartford, Conn. Pub. by Century Industries, Inc., Chicago, Ill.

DuraBrite

For Mirrors.

### CLASS 35

### BELTING, HOSE, MACHINERY PACKING, AND NONMETALLIC TIRES

275,954. Oct. 7, 1930. Aaron Meyerowitz, Brooklyn, N. Y. Pub. by registrant.

UNITED

For Inner Tubes for Tires.

### CLASS 39

### CLOTHING

210,064. Mar. 9, 1926. McCallum Hosiery Co., Northampton, Mass. Pub. by Claussner Hosiery Company, Paducah, Ky.

McCallum

For Hosiery for Men, Women, and Children.

337,550. Aug. 11, 1936. Susquehanna Waist Company, Philadelphia, Pa. Pub. by Susquehanna Waist Company, Upland, Pa.

Wallau, Alex Lee, Inc., New York, N. Y. 636,860, pub. 8–21–56. Cl. 39.
Walter, Martin, Ltd., Folkestone, Kent, England. 636,742, pub. 8–21–56. Cl. 19.
Wanamaker, John, Philadelphia, Philadelphia, Pa. 636,836, pub. 8–21–56. Cl. 39.
Ward, F. D., Ltd., Higham Ferrers, England. 636,867, pub. 8–21–56. Cl. 39.

Warp Brothers: *See*—
Flex-O-Glass, Inc.
Water Treatment Engineering Corp., Fort Wayne, Ind. 636,804, pub. 8–21–56. Cl. 31.
Watson-Stillman Co., The: *See*—
Leschen, A., & Sons Rope Co.
Webster, G. L., Co., Inc., Cheriton, Va. 528,603, canc. Cl. 46.
Weiss, Gerhart, d. b. a. Weiss Laboratories, Long Island City, N. Y. 528,633, canc. Cl. 22.
Weiss Laboratories: *See*—
Weiss, Gerhart.
Welding Advertising Agency, Inc., New York, N. Y. 636,831, pub. 8–21–56. Cl. 35.
Wenselmann-Bohrer-Co. A.-G., Munich, Germany. 636,779, pub. 8–21–56. Cl. 23.
Weston, Michael, d. b. a. Weston Products Co., Brooklyn, N. Y., to Weston Products Co. 528,839, canc. Cl. 50.
Weston Products Co.: *See*—
Weston, Michael.
Weston's Inc., Columbia, S. C. 636,744, pub. 8–21–56. Cl. 19.
Whitcomb Locomotive Co., The, Rochelle, Ill. 528,655, canc. Cl. 23.
White Bros. & Co., Little Rock, Ark. 528,664, canc. Cl. 22.
Williams, Cy, d. b. a. Cy Williams Fabricators, Port Washington, N. Y. 528,558, canc. Cl. 12.
Williams, Cy, Fabricators: *See*—
Williams, Cy.
Williamson, John A., d. b. a. Williamson Orchard, Caldwell, Idaho. 636,916, pub. 8–21–56. Cl. 46.
Williamson Orchard: *See*—
Williamson, John A.
Wilson Sporting Goods Co., Chicago, Ill. 528,825, canc. Cl. 22.
Winter & Co., Inc., New York, N. Y. 636,816, pub. 8–21–56. Cl. 36.
Wood, Fay, Corp., New York, N. Y. 528,587, canc. Cl. 51.
Wood Flong Corp., Hoosick Falls, N. Y. 636,942, pub. 8–21–56. Cl. 50.
Woolworth, F. W., Co., New York, N. Y. 528,922, canc. Cl. 16.
Wooster Rubber Co., The, Wooster, Ohio. 636,933, pub. 8–21–56. Cl. 50.
X-Pando Corp., Long Island City, N. Y. 397,331, 12(c) pub. 11–6–56. Cl. 12.
Younger, George, & Son Ltd., Alloa, Scotland. 528,696, canc. Cl. 46.
Zip A Bac Co.: *See*—

# PATENTS

## NOTICES

### Adjudicated Patent

(C. A. Oreg.) Smith Patent No. 2,001,271 (137—244), for a gate valve, *Held* infringed. *The United States National Bank of Portland, Oregon et al.* v. *Fabri-Valve Company of America*, 235 F.2d 563; 110 USPQ 77.

### Patents Available for Licensing or Sale

2,628,846. Trailer Vehicle and Coupling Therefor. Gilbert Bratlien, 3915 De Garmo Ave., El Monte, Calif.

2,747,904. Device for Removably Connecting an Element to a Wall. Karl Koch, Morfelder Landstrasse 45, Frankfurt am Main, Germany. Correspondence to Dr. Max Kronenberg, 1429 E. McMillan St., Room 202, Cincinnati 6, Ohio.

2,749,619. Automatic Drafting Scale. Eugene M. Todd, E. Swamp Road, R. D. 3, Doylestown, Pa.

2,757,953. Bale Grapple (Hay and Cotton Bale Loading Equipment). Paul E. Kunkel, % Cassel Bros. Gin, Route 1, Lockney, Tex.

2,763,089. Ball-End Fishhook. Marshall E. McDonald, P. O. Box 402, Babbitt, Nev.

Michael Grasiosi offers the following two patents. Inquiries concerning the patents should be addressed to: Michael Grasiosi, 383 Second St., Jersey City 2, N. J.

2,692,316. Combination Safety Fuse Plug.

2,706,818. Control Device for Flush Tanks.

General Electric Company is prepared to grant nonexclusive licenses under the following 33 patents on reasonable terms to domestic manufacturers.

Applications for license may be addressed to: General Electric Company, Transformer Division, 100 Woodlawn Ave., Pittsfield, Mass., Attention Patent Counsel.

Re. 22,744. Electric Circuit Breaker.

2,246,180. Lightning Arrester.

2,254,696. Resistance Welding Electrode.

2,261,633. Potential Distributing Insulator Tube and Method for Making Same.

2,267,393. Electric Circuit Interrupting Apparatus.

2,287,499. Jumpering Device.

2,296,621. Lightning Arrester.

2,300,195. Electrical Apparatus.

2,324,888. Electric Switch.

2,325,935. Electrical Protective Device.

2,335,062. Electric Circuit Interrupter.

2,348,029. Reclosing Circuit Interrupting Device.

2,354,907. Electric Switch.

2,371,969. Impulse Protected Fuse.

2,379,729. Electric Circuit.

2,380,769. Reclosing Circuit Interrupting Device.

2,372,035. Lightning Arrester.

2,385,663. Protective Device.

2,391,681. Gang Operating Mechanism for Switching Devices.

2,399,028. Terminal Construction.

2,414,308. Protective Gap Device.

2,424,126. Electric Circuit Breaker.

2,433,666. Electric Circuit Interrupter.

2,464,565. Disconnecting Device.

2,555,971. Arc Extinguishing Device.

2,600,305. Electrical Protective Device.

2,677,810. Step Voltage Regulator.

2,682,176. Resilient Power Transmission Mechanism.

2,707,261. Motor Speed Reduction Device.

2,727,961. Refusable Fuseholder.

2,740,016. Electrical Fuseholder Construction.

2,749,408. Fuseholder Having a Spring Loaded Cap.

2,753,467. Parallel Operation of Transformers.

### Disclaimer

2,697,742.—*John Evans*, Princeton, N. J. SWITCHING APPARATUS. Patent dated Dec. 21, 1954. Disclaimer filed Oct. 19, 1956, by the assignee, *Radio Corporation of America*.

Hereby disclaims the remaining portion of the term of said patent.

### New Applications Received During September 1956

| | |
|---|---|
| Patents | 5,343 |
| Designs | 336 |
| Plants | 11 |
| Reissues | 10 |
| Total | 5,700 |

### Issue

| | | |
|---|---|---|
| Patents | 826—No. 2,769,978 to No. | 2,770,803, incl. |
| Designs | 55—No. 179,178 to No. | 179,232, incl. |
| Plants | 1—No. 1,527 | |
| Reissues | 2—No. 24,237 to No. | 24,238, incl. |
| Total | 884 | |

# CONDITION OF PATENT APPLICATIONS AS OF SEPTEMBER 28, 1956

| | |
|---|---|
| Total number of pending applications (excluding Designs) | 217,262 |
| Total number of pending Design applications | 6,321 |
| Total number of applications awaiting action (excluding Designs) | 120,294 |
| Total number of Design applications awaiting action | 2,772 |
| Date of oldest new application | Apr. 29, 1955 |
| Date of oldest amended application | May 18, 1954 |

ROSA, M. C., Director, Patent Examining Operation

| PATENT EXAMINING GROUPS, AND SUPERVISORY EXAMINERS | DIVISIONS |
|---|---|
| I. STONE, I. G., CHEMICAL AND RELATED ARTS | 6, 21, 26, 43, 46, 59, 86, 89, 90, 63, 64. |
| II. STRACHAN, O. W., COMMUNICATIONS, RADIANT ENERGY AND ELECTRICAL ARTS | 16, 23, 28, 37, 42, 44, 48, 51, 54, 60, 70. |
| III. YUNG KWAI, B., MECHANICAL MANUFACTURING, MACHINE ELEMENTS AND DESIGNS | 2, 12, 13, 14, 21, 24, 57, 58, 61, Designs. |
| IV. FREEHOF, H. B., MATERIAL HANDLING AND TREATING, OPTICS, RAILWAYS AND AMUSEMENT DEVICES. | 7, 11, 17, 27, 34, 35, 39, 53, 62. |
| V. HULL, J. S., STATIC STRUCTURES AND INSTRUMENTS OF PRECISION | 8, 20, 29, 33, 36, 40, 41, 52, 66. |
| VI. MURPHY, T. F., AGRICULTURE, TRANSPORTATION, PUMPS AND MOTORS | 1, 4, 5, 9, 10, 18, 22, 25, 45, 67. |
| VII. KAUFFMAN, H. E., HEATING AND COOLING, PLASTIC SHAPING AND COATING, SEPARATION AND MIXING, BODY TREATMENT AND CARE. | 3, 15, 19, 25, 30, 32, 49, 55, 67. |
| CL. GORECKI, G. A., ARTS UNDERGOING RECLASSIFICATION AS LISTED UNDER CLASSIFICATION DIVISIONS. | I, II, III, IV, V. |

| DIVISIONS, EXAMINERS AND SUBJECTS OF INVENTION (Roman numerals in parentheses indicate Examining Group) | Oldest Application: New | Amended |
|---|---|---|
| 1. (VI) GOLDBERG, A. J., Brakes; Excavating; Planting; Plant Husbandry; Scattering Unloaders | 10-21-55 | 11-9-54 |
| 2. (III) HERRMANN, D., Fishing, Trapping and Vermin Destroying; Presses; Tobacco; Textile Wringers | 12-22-55 | 6-7-55 |
| 3. (VII) LE ROY, C. A., Metal Founding and Treatment; Metallurgy (Process and Apparatus); Alloys | 1-22-56 | 11-8-54 |
| 4. (VI) FALLER, E. A., Hoists; Power Driven Conveyors; Handling Apparatus; Elevators; Feeding of Indefinite Lengths | 12-28-55 | 1-28-55 |
| 5. (VI) ROBINSON, C. W., Harvesters; Potato Diggers; Stalk Pullers and Choppers; Stone Gatherers; Threshing; Knotters; Animal Husbandry; Bee Culture; Dairy; Butchering; Vegetable and Meat Cutters and Comminuters; Fences; Gates | 12-12-55 | 5-3-55 |
| 6. (I) SURLE, H., Carbon Chemistry (part), e. g. Natural Resins, Proteins, Heterocyclic Amides, Amines, General Organic Processes | 7-1-55 | 3-10-55 |
| 7. (IV) GONSALVES, J. E., Optics, Photographic Apparatus | 12-9-55 | 1-3-55 |
| 8. (V) LEWIS, R. O., Beds; Chairs and Seats; Cabinets; Tables; Miscellaneous Furniture | 7-14-55 | 9-23-54 |
| 9. (VI) BRANSON, J. H., Pumps; Fans; Turbines | 12-20-55 | 12-14-54 |
| 10. (VI) BOYD, S., Firearms; Ordnance; Ammunition; Explosive Charge Making | 9-21-55 | 1-17-55 |
| 11. (IV) BENHAM, E. V., Boots, Shoes and Leggings; Shoe and Leather Manufacture; Button, Eyelet and Rivet Setting; Nailing, Stapling and Clip Clenching; Card, Picture and Sign Exhibiting; Cultery; Cleaning and Liquid Treatment of Solids | 2-3-56 | 4-6-55 |
| 12. (III) SPINTMAN, S., Machine Elements; Engine Starters; Interrelated Clutch and Motor Controls | 10-10-55 | 9-13-54 |
| 13. (III) BEALL, T. E., Gear Cutting; Electric Lamp and Tube Manufacture; Needle and Pin Making; Metal Working (part), e. g. Special Work, Forging, Plastic Working, Drawing, Sawing, Milling, Planing, Turning | 12-5-55 | 10-4-54 |
| 14. (III) MANIAN, J. C., Metal Working (part), e. g. Sheet Metal, Wire Bending, Miscellaneous Processes, Assembly and Disassembly Apparatus; Wire Fabrics; Air Brakes | 9-20-55 | 9-17-54 |
| 15. (VII) BRINDISI, M. V., Plastics; Plastic Block and Earthenware Apparatus; Glass | 1-3-56 | 9-23-54 |
| 16. (II) LOVEWELL, N. N., Television; Telephony; Recorders | 9-28-55 | 7-20-54 |
| 17. (IV) LEIGHEY, R. A. (HOFFMAN, R. J., acting), Paper Manufactures; Packaging; Typewriters; Printing; Type Casting and Setting; Sheet Material Association or Folding; Sheet or Web Feeding | 11-14-55 | 1-7-55 |
| 18. (VI) BLUM, A., Power Plants; Fluid Transmissions; Servomotor Systems; Jet Motors; Combustion Turbines; Speed Responsive Devices | 11-16-55 | 12-20-54 |
| 19. (VII) PATRICK, P. L., Stoves and Furnaces; Boilers; Concentrating Evaporators; Fluid Fuel Burners | 12-14-55 | 4-26-55 |
| 20. (V) BROWN, L. M., Miscellaneous Hardware; Closure Fasteners; Locks; Safes; Bank Protection; Bread, Pastry and Confection Making; Tents and Canopies; Umbrellas; Canes; Undertaking | 1-10-56 | 1-3-55 |
| 21. (III) MADER, R. C., Textiles | 12-5-55 | 1-13-55 |
| 22. (VI) MARLAND, M. L., Aeronautics; Boats; Buoys; Ships; Marine Propulsion; Propellers; Windmills; Fluid Diaphragms and Bellows; Boring and Drilling | 11-25-55 | 11-9-54 |
| 23. (II) ANDRUS, L. M., Cash and Fare Registers; Calculators and Counters; Education | 9-8-55 | 9-15-54 |
| 24. (III) DRACOPOULOS, P. T. (HICKEY, T. J., acting), Apparel (except Corsets and Brassieres); Apparel Apparatus; Sewing Machines; Textiles, Ironing or Smoothing; Clutches and Power-Stop Control | 1-9-56 | 10-14-54 |
| 25. (VII) NEVIUS, R. D., Coating—Processes, Miscellaneous Products and Apparatus; Distillation; Wood Treating Apparatus | 10-27-55 | 1-3-55 |
| 26. (II) YOUNG, R. R., Electricity—Generation, Motive Power, Transmission Systems, Voltage and Phase Control Systems, Furnaces, Battery Charging and Discharging, Arc Lamps, Prime Mover Dynamo Plants; Elevators (part), e. g. Miscellaneous Electric Control Mechanism | 1-31-56 | 7-26-55 |
| 27. (IV) JAMES, S., Brushing, Scrubbing and General Cleaning; Brush, Broom and Mop Making | 1-9-56 | 3-11-55 |
| 28. (VI) BRAUNER, R. H., Internal Combustion Engines; Expansible Chamber Motors; Fluid Servomotors; Spring, Weight and Animal Powered Motors; Cylinders; Pistons; Drive Shafts; Flexible-Shaft Couplings; Chucks or Sockets; Chute, Skid, Guide and Way Conveyors; Fluid Current Conveyors; Pressure Modulating Relays; Pneumatic Dispatch; Store Service; Wheel Substitutes | 10-10-55 | 1-10-55 |
| 29. (V) HABECKER, L. B., Tools; Woodworking; Button, Barrel and Wheel Making; Rubber Tire Removing Tools; Washing Machines; Baggage; Cloth, Leather and Rubber Receptacles; Package and Article Carriers | 11-23-55 | 2-21-55 |
| 30. (VII) O'LEARY, R. A., Refrigeration; Heating Systems; Automatic Temperature and Humidity Regulation, Thermostats, Humidistats; Illuminating Burners; Miscellaneous Heating | 4-2-56 | 5-9-55 |

| DIVISIONS, EXAMINERS AND SUBJECTS OF INVENTION (Roman numerals in parentheses indicate Examining Group) | Oldest Application: New | Amended |
|---|---|---|
| 31. (I) HUTCHISON, E. W., Carbon Chemistry (part), e. g. Urea Adducts, Silicon Containing Carbon Compounds, Hydrogenation of Carbon Oxides, Partial Oxidation of Non-Aromatic Hydrocarbon Mixtures, Hydrocarbons, Halogenated Hydrocarbons | 9-9-55 | 5-17-55 |
| 32. (VII) BERMAN, H., Gas and Liquid Contact Apparatus; Heat Exchange; Gas Separation; Agitation; Self Proportioning Fluid Systems; Liquid Level Responsive Systems; Fire Extinguishers | 1-9-56 | 6-18-55 |
| 33. (V) MUSHAKE, W. L., Bridges; Hydraulic and Earth Engineering; Building Structures; Roads and Pavements | 12-12-55 | 9-14-54 |
| 34. (IV) SAPERSTEIN, S., Railways—Draft Appliances, Switches and Signals, Surface Track, Rolling Stock, Track Sanders; Electricity, Transmission to Vehicles; Dumping Vehicles; Vehicle Fenders; Hand and Hoist Line Implements | 11-22-55 | 9-13-54 |
| 35. (IV) BROMLEY, E. D., Dispensing; Plastic Material Handling, Filling; Toilet, Kitchen and Table Articles | 1-12-56 | 9-16-55 |
| 36. (V) McFADYEN, A. D., Measuring and Testing | 9-26-55 | 9-9-55 |
| 37. (II) LEVY, M. L., Electricity—Switches, Welding, Heating | 10-14-55 | 9-11-55 |
| 38. (I) MARMELSTEIN, N., Carbon Chemistry (part), e. g., Azo, Carbocyclic or Acyclic Compounds (part), e. g. Anthrones, Triarylmethanes, Esters, Acids, Ketones, Aldehydes, Ethers, Phenols, Alcohols | 1-5-56 | 6-6-55 |
| 39. (IV) WEIL, I., Fluid-Pressure Regulators; Valves; Fluid Handling (except Pressure Modulating Relays, Self-Proportioning Systems, Float Valves, Diaphragms and Bellows) | 1-9-56 | 10-1-54 |
| 40. (V) DRUMMOND, E. J., Receptacles—Metallic, Paper, Wooden, Glass; Special Receptacles and Packages | 1-9-56 | 9-1-55 |
| 41. (V) GURLEY, R. B., Coin Controlled Apparatus; Dispensing Cabinets; Coin Handling; Mail, Fare or Other Collection Boxes or Chutes; Buckles, Buttons and Clasps; Racks; Fire Escapes; Ladders; Scaffolds | 7-20-55 | 9-9-54 |
| 42. (II) MARANS, H., Electric Signaling; Signals and Indicators; Telegraphy; Electrical Connectors | 4-29-55 | 10-19-54 |
| 43. (I) ARNOLD, D., Medicines, Poisons, Cosmetics; Sugar and Starch; Skins, and Leathers; Preserving, Sterilizing and Disinfecting (except Weed Treatment Apparatus) | 9-22-55 | 1-25-55 |
| 44. (II) EVANS, N. H., Antennas; Automatic Pilots; Directive Radio Systems; Mass Spectrometers; Nuclear Batteries; Nuclear Resonant Devices; Neutron Detecting and Measuring; Radar ;Sonar; Torpedoes | 6-2-55 | 6-18-54 |
| 45. (VI) MANIAN, J. A., Wheels, Tires and Axles; Railway Wheels and Axles; Lubrication; Bearings and Guides; Belt and Sprocket Gearing; Spring Devices; Animal Draft Appliances | 10-28-55 | 2-9-55 |
| 46. (I) WILES, W. G., Actinide Series (e. g., Senionable) Compounds; Sintered Metal Stock; Explosives; Power Plants (part); Metallurgy (part); Surgery (part); Radioactive Medicines; Irradiation Chemistry; Carbon Chemistry (part) | 7-26-55 | 1-10-55 |
| 47. (VI) KANOF, W. J., Mining, Quarrying, and Ice Harvesting; Motor Vehicles; Land Vehicles | 1-10-56 | 7-20-55 |
| 48. (II) BERNSTEIN, S., Electricity—Conversion Systems, Protective Systems; Measuring and Testing (except Meters); Spark Plugs and Ignition Systems; Switchboards, Relays, Magnets, Inductors, Transformers, Condensers, Transisters, Barrier Layer Rectifiers | 8-12-55 | 9-16-54 |
| 49. (VII) BENDETT, B., Drying and Gas or Vapor Contact with Solids; Ventilation; Wells; Earth Boring | 9-1-55 | 2-21-55 |
| 50. (I) BENGEL, W. G., Carbon Chemistry (part), e. g. Synthetic Resin Compositions, Synthetic Rubber Compositions, Natural Rubber | 12-20-55 | 9-7-54 |
| 51. (II) YAFFEE, S., Radio Transmitters, Receivers and Tuners; Modulators; Piezoelectric Devices; Music | 12-20-55 | 9-24-54 |
| 52. (V) NEFF, P. E., Supports; Joint Packing; Valved Pipe Joints or Couplings; Rod Joints or Couplings; Tool Handle Fastenings; Pipes and Tubular Conduits; Shaft Packing | 10-24-55 | 11-16-54 |
| 53. (IV) REYNOLDS, E. R., (NINAS, G. A., acting), Label Pasting and Paper Hanging; Books and Book Making; Manifolding; Printed Matter; Stationery; Paper Files and Binders; Flexible or Portable Closures or Partitions; Doors, Windows, Awnings and Shutters; Harness; Whip Apparatus | 12-2-55 | 9-30-55 |
| 54. (II) NILSON, R. G., Electric Lamps; Electronic Tubes; Miscellaneous Discharge Devices; Lamp, Cathode Ray and Gas Discharge Device Circuits; Ray Energy (e. g. X-Ray, Ultraviolet, Radioactive) Applications | 10-24-55 | 10-4-54 |
| 55. (VII) KLINE, J. B., Surgery; Dentistry; Artificial Body Members; Separating and Sorting Solids; Centrifugal Bowl Separators; Comminuters | 7-29-55 | 11-16-54 |
| 56. (I) SPECK, J. R., Abrading Compositions; Batteries; Coating or Plastic Compositions; Electrical and Wave Energy Chemistry | 12-23-55 | 9-13-55 |
| 57. (III) MILLER, A. B., Bolt, Nut, Rivet, Nail, Screw, Chain and Horseshoe Making; Driven and Screw Fastenings; Nut and Bolt Locks; Jewelry; Pipe Joints or Couplings | 2-19-56 | 2-9-55 |
| 58. (III) BRONAUGH, F. H., Rolls and Rollers; Making Metal Tools and Implements; Stone Working; Abrading Processes and Apparatus; Food Apparatus; Closure Operators; Baths, Closets, Sinks and Spittons | 10-17-55 | 11-4-54 |
| 59. (I) HENKIN, B., Inorganic Chemistry; Fertilizers; Gas, Heating and Illuminating | 9-29-55 | 1-24-55 |
| 60. (I) MANGAN, P. E., Carbon Chemistry (part), e. g., Synthetic Resins, Synthetic Rubber; Photographic Processes and Products | 8-2-55 | 9-30-54 |
| 61. (III) MORSE (Miss), E. L., Winding and Reeling; Pushing and Pulling; Horology; Time Controlling Apparatus; Railway Mail Delivery | 12-6-55 | 2-4-55 |
| 62. (IV) SHAPIRO, A., Games; Toys; Amusements and Exercising Devices; Mechanical Guns and Projectors; Illumination | 1-9-56 | 7-9-55 |
| 63. (I) WINKELSTEIN, A. H., Foods and Beverages; Carbon Chemistry (part), e. g., Ligains, Carbonhydrate Derivatives; Fats and Metal Containing Carbocyclic or Acyclic Carbon Compounds | 11-28-55 | 12-15-54 |
| 64. (I) GREENWALD, J., Fuels; Miscellaneous Compositions | 12-27-55 | 12-29-54 |
| 66. (V) LISANN, L., Geometric Instruments; Automatic Weighing Scales; Acoustics | 10-27-55 | 6-21-54 |
| 67. (VII) KRAFFT, C. F., Laminated Fabrics; Ornamentation; Bleaching, Dyeing, Fluid Treatment of Textiles | 9-6-55 | 2-18-55 |
| 68. (II) GALVIN, D. J., Wave Guides; Electric Meters; Sound Recording; Conductors; Insulators | 11-17-55 | 6-15-54 |
| 70. (II) BREWBINK, J. L., Security laws administration. | | |
| CLASS. DIVS. I BAILEY, J. S., Paper Making; Mineral Oils | 9-14-55 | 4-6-55 |
| CLASS. DIVS. II LADY, J. E., Oscillators; Amplifiers; Resistances and Rheostats | 1-16-56 | 10-14-55 |
| CLASS. DIVS. III WAHL, R. A., Cutting and Punching; Apparel (part), e. g., Corsets and Brassieres | 1-9-56 | 7-5-55 |
| CLASS. DIVS. IV SMITH (Mrs.), M. P., Harrows and Diggers; Plows; Fluid Sprinkling, Spraying and Diffusing | 12-2-55 | 2-14-55 |
| CLASS. DIVS. V ANGLE, C. D., Liquid Separation or Purification; Sewerage | 2-6-56 | 2-1-56 |
| DESIGNS (III) A—MONCURE, J. A. (acting), Industrial Arts | 2-27-56 | 2-27-56 |
| DESIGNS (III) B—GRAY, M. A., Household, Personal and Fine Arts | 2-2-56 | 2-13-56 |

The following divisions have been abolished: 65 and 69

## EXPIRATION OF PATENTS

The patents within the range of numbers indicated below expire during November 1956, except those which may have been extended under the provisions of the Veterans Patent Extension Act (64 Stat. 316 as amended by 66 Stat. 321) and those which may have expired earlier due to shortened terms under the provisions of Public Law 690. A list of Veterans' patents which have been extended appears in the *Annual Index of Patents—1955*.

| | |
|---|---|
| Patents | Numbers 2,178,536 to 2,181,857, inclusive |
| Plant Patent | Numbers 346 to 348, inclusive |

# PATENT SUITS

Notices under 35 U. S. C. 290; Patent Act of 1952

2,018,968, Keeney and Ferm, Rolling mill; 2,072,122, A. B. Montgomery, same; 2,072,121, same, Method and apparatus for guiding material; 2,087,065, same, Method and apparatus for rolling; 2,214,107, same, Method of rolling; 1,977,214, A. P. Stockel, Method and apparatus for hot rolling strip metal, filed Mar. 9, 1950, D. C., E. D. Mich. (Detroit), Doc. 9070, *McLouth Steel Corp.* v. *The Cold Metal Products Co.* Patent 2,018,968 held invalid as to claims 2, 5, 10, 11, and 16 to 26 inclusive; Patent 1,977,214 held invalid as to claims 2 to 5 inclusive, 11 to 13 inclusive, 18 and 22; Patent 2,072,121 held invalid as to claims 2 and 3; Patent 2,072,122 held invalid as to claims 6, 10, and 15 to 20 inclusive; Patent 2,087,065 held invalid as to claims 1 to 5 inclusive; Patent 2,214,107 held invalid as to claims 4 and 6 to 10 inclusive (notice Oct. 5, 1956).

2,104,949, 2,199,227, A. M. Marks, Crystalline formation, appeal filed Oct. 19, 1955, C. C. A., 1st Cir., Doc. 5055, *Alvin M. Marks et al.* v. *Polaroid Corp.* Judgment of District Court affirmed (notice Oct. 10, 1956).

2,104,797, M. Birkigt, Percussion fuse for projectiles, filed Oct. 5, 1956, Ct. Cls., Doc. 432/56, *Brevets Aero-Mechaniques, S. A.* v. *The United States.*

2,198,227. (See 2,104,949.)

2,211,612, 2,211,614, R. M. Bowie, Cathode ray tube, filed July 20, 1956, D. C., E. D. N. Y. (Brooklyn), Doc. 16754, *Sylvania Electric Products Inc.* v. *Claremont Tube Corp.* Dismissed without prejudice Oct. 10, 1956.

2,211,614. (See 2,211,613.)

2,214,107. (See 1,918,968.)

2,220,504, W. Kromer, Woodworking tool, filed June 6, 1956, D. C., N. D. Ill. (Chicago), Doc. 56c989, *Lace Die Casting Co. et al.* v. *Edward Lasham Co. et al.* Stipulation and consent order dismissing defendants Joseph M. Andalman, Avrum M. Andalman; Leo Andalman and Rose Finsky, doing business as Edward Lasham Co. Aug. 3, 1956: On stipulation; complaint and counterclaim dismissed Sept. 14, 1956.

2,220,542, K. Schmidt, Combination purse and billfold, filed Oct. 2, 1956, D. C., S. D. N. Y., Doc. 113/264, *Marioness & Co. Inc.* v. *Bernard Cahn Co. Inc.*

2,224,052, C. A. Kaufman, Stocking and method of knitting, filed Oct. 5, 1956, D. C., M. D. N. C. (Greensboro), Doc. 1056–G, *Alamance Industries, Inc.* v. *Sherney Hosiery Mills, Inc.*

2,239,200. (See 2,496,194.)

2,266,661, J. G. Sola, Alternating current supply system, filed Aug. 16, 1955, D. C., N. J. (Newark), Doc. 733/55, *Sola Electric Co.* v. *Universal Mfg. Corp.* Stipulation and order of dismissal Oct. 5, 1956.

2,266,263, D. A. Lyon, Method for coating optical elements, filed Mar. 11, 1954, D. C., W. D. N. Y. (Buffalo), Doc. 6135, *Dean A. Lyon* v. *Wollensak Optical Co.* Judgment favor plaintiff Sept. 19, 1956; order dismissing 3rd party complaint Oct. 3, 1956.

2,466,194, S. Bennett, Powder distributor for preventing offset from freshly printed sheets; 2,230,899, W. Wilson, Non-offset spraying device, filed Mar. 7, 1950, D. C., S. D. N. Y., Doc. 56/230, *International Dry Spray Corp. et al.* v. *Western Newspaper Union.* Stipulation and order of discontinuance (notice Sept. 27, 1956).

2,500,510, C. Cohen et al., Apparatus for making cheese, filed Dec. 22, 1952, D. C., W. D. Wis. (Madison), Doc. 2421, *Chain-O-Lakes, Inc. et al.* v. *Blue Moon Foods, Inc.* Consent judgment; patent held valid and infringed; injunction granted enjoining defendant from further infringement Sept. 12, 1956.

2,645,769. (See Des. 164,294.)

2,647,666, Stewart and Winters, Retrieving arrangement for well drilling operations, filed Sept. 1, 1954, D. C., S. D. Tex. (Houston), Doc. 8462, *Tri-State Oil Tool Co., Inc.* v. *Houston Oil Field Material Co., Inc.* Consent decree; patent held valid and infringed; no injunction issued; counterclaim dismissed with prejudice Oct. 5, 1956.

2,678,753, W. O. Hersey, Toy pistol; 2,724,338, same, Toy gun, filed Oct. 4, 1956, D. C., S. D. N. Y., Doc. 113/302, *Knickerbocker Plastic Co., Inc.* v. *Empire Plastic Corp.*

2,707,380, D. C. Taggart, Bed pad, filed Oct. 8, 1956, D. C., E. D. N. Y. (Brooklyn), Doc. 16972, *The General Cellulose Co., Inc.* v. *Whitestone Products Co., Inc. et al.*

2,724,338. (See 2,678,753.)

2,724,702, D. B. Marshall, Method of improving and simplifying the cold milling of soap and product obtained thereby, filed Oct. 10, 1956, D. C. Md. (Baltimore), Doc. 9207, *Donald E. Marshall* v. *The Procter & Gamble Mfg. Co. et al.*

2,737,422, J. H. Barnes, Trim and protective member for attachment to an automobile tire and wheel assembly, filed May 2, 1956, D. C. N. J. (Newark), Doc. 378/56, *James H. Barnes et al.* v. *Eastern Molding Co. et al.* Stipulation of dismissal; patent infringed (notice Oct. 5, 1956).

2,749,866, R. H. Thomas, Dispenser, appeal filed Sept. 25, 1956, C. C. A., 2nd Cir., Doc. 24310, *Carter Products, Inc.* v. *Bristol-Myers Co.*

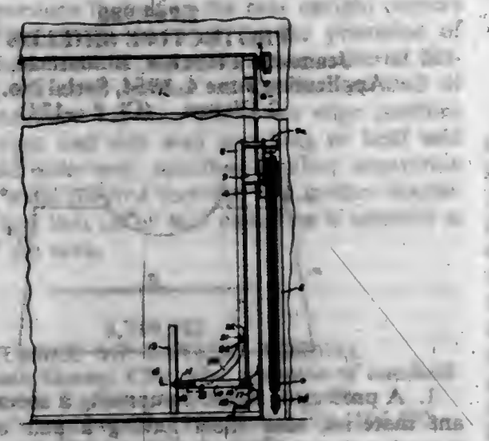
2,757,536, H. E. Crawford, Knitting machine, filed Aug. 23, 1956, D. C., M. D. N. C. (Greensboro), Doc. 1042–G, *H. E. Crawford Co., Inc.* v. *Hemphill Co. et al.*

Des. 164,294, S. S. Fortino, Multiway electrical connector or similar article; 2,645,769, same, Blade engageable electric connector, filed Sept. 17, 1953, D. C., E. D. N. Y. (Brooklyn), Doc. 13843, *Gem Electric Mfg. Co., Inc.* v. *A. K. Electric Corp. et al.* Dismissed with prejudice Oct. 10, 1956.

# REISSUES

## NOVEMBER 13, 1956

Matter enclosed in heavy brackets [ ] appears in the original patent but forms no part of this reissue specification; matter printed in italics indicates additions made by reissue.



24,237

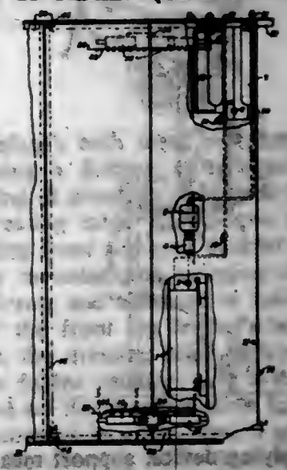
### OVERHEAD DOOR STRUCTURE

George W. Sjoboen, Birmingham, Mich., assignor to Steel Door Corporation, Pontiac, Mich., a corporation of Michigan

Original No. 2,741,806, dated April 17, 1956, Serial No. 403,265, January 11, 1954. Application for reissue May 17, 1956, Serial No. 585,598

11 Claims. (Cl. 20—19)

*11. In an overhead door structure of the type wherein a door panel is rotatably mounted on support arms which swing to generally vertical upward and downward positions for opening and closing the door, stabilizing structure for the door which comprises, a brace structure attached to said door panel adjacent each side through means including a pivotal bearing connection disposed generally on the axis of rotation of said support arms relatively to said door panel, each brace structure having at least two spaced apart connections to one of said support arms, one of which is a pivotal connection and the other of which is a shiftable connection, so that said brace structure can be swung about said pivotal connection to selected positions relatively to said support arm for centering said door panel in a doorway, means operable to lock said shiftable connection to secure said brace structure in adjusted position, said pivotal bearing connections being shiftable relatively to said door panel in a plane generally parallel to the plane of the door panel for adjusting the positions of said pivotal bearing connections with respect to the axis of rotation of said support arms on said door panel, and means operable to fix said pivotal bearing connections in adjusted relation.*



24,238

### POWER OPERATED HATCH COVER

Edward M. Greer, Great Neck, and Jean Mercier, New York, N. Y., assignors, by direct and mesne assignments, to G. M. E. Corporation, Brooklyn, N. Y., a corporation of New York

Original No. 2,491,261, dated December 13, 1949, Serial No. 646,696, February 9, 1946. Application for reissue January 30, 1956, Serial No. 562,374

15 Claims. (Cl. 160—188)

*10. A cover assembly for a hatchway, comprising a pair of panels each having an outer end an inner face lying in side by side relation in substantially a horizontal plane when they close the hatchway, means pivotally mounting an edge of one of said panels with respect to such hatchway, pivot means the axes of which extend along a straight line substantially parallel to the plane of the hatchway, connecting the adjacent edges of said panels for folding movement thereof between closed substantially horizontal position and open substantially vertical position, means to guide the opposite edge of the other of said panels in substantially a horizontal plane, reaction means for said pair of panels, said pivot means being substantially at the inner face of said panels and pivotally mounting said reaction means, and movable means carried by said cover assembly operatively connected to said reaction means to react thereagainst in order to effect movement of said panels about said pivot means, between closed and open position, said movable means being located under the outer face of said panel to be positioned between the outer faces of said panels when they are in open position, said reaction means, each of said pivot means and said movable means all being located within the perimeter of said panels when in closed position.*

# PLANT PATENTS

## GRANTED NOVEMBER 13, 1956

Owing to the fact that almost all of the illustrations of the plant patents are in colors, it is not practicable to print a cut of the drawing.

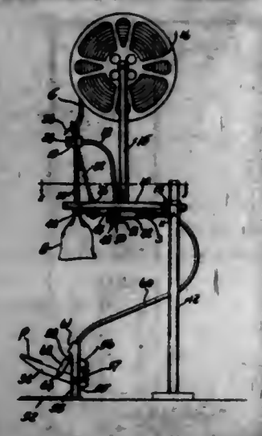
1,527

### ROSE PLANT

Thomas Edison Meteer, Fairport, N. Y.

Application December 6, 1955, Serial No. 551,462

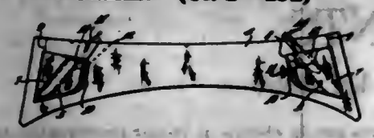
1 Claim. (Cl. 47—61)



A new and distinct variety of rose plant substantially as hereinabove described and disclosed, characterized as to novelty by its thornless canes and branches; by its Carmine and related colored blooms; by the unusual form of its flower which may be described, in its early stage of bloom, as an attractive loose ball of petals resting on five or more large, outer, fully unfurled petals radiating from the base of said ball; by its abundant production of flowers with stiff narrow stem; by its dark, leathery leaves with small, simple serrations.

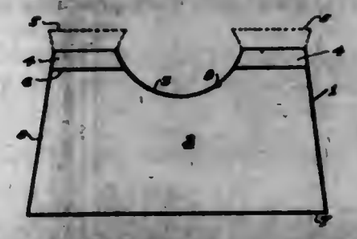
# PATENTS

## GRANTED NOVEMBER 13, 1956



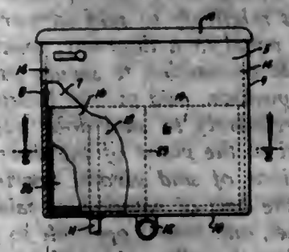
## GENERAL AND MECHANICAL

**2,769,978**
**CLIP APPLYING DEVICES**
**Ercole R. Berlasi, Saginaw, Mich.**
**Application June 29, 1953, Serial No. 364,661**
**10 Claims. (Cl. 1—187)**



1. In a clip applying device, support means shaped to provide a recess into which the neck of a bag can be inserted, an anvil mounted on said support rearwardly of said recess, means for feeding a U-shaped clip including legs with depressions therein into position to be clinched, with the body portion thereof disposed forwardly of said anvil and the legs thereof extending forwardly to straddle the neck of said bag, oppositely disposed, substantially hook-shaped jaws having reversely curved adjacent ends pivotally mounted interjacent their ends on both sides of said recess, the inner walls of the hooked ends of said jaws being recessed to provide reduced leg portions engageable in the depressions in said legs of the clip when the jaws are swung laterally to close the legs of a clip about the neck of the bag, and means for swinging said jaws laterally and thence moving the jaws rearwardly toward said anvil to fold the ends of the clip inwardly, the recess of said jaws forming also substantially lateral shoulders engaging the legs and aiding in folding them inwardly when the jaws are moved rearwardly.

**2,769,979**
**NON-REMOVABLE COLLAR STAY**
**Gilbert O. Driesbach, Robesonia, Pa., assignor to Publix Shirt Corporation, New York, N. Y., a corporation of New York**
**Application August 2, 1954, Serial No. 447,363**
**4 Claims. (Cl. 2—132)**



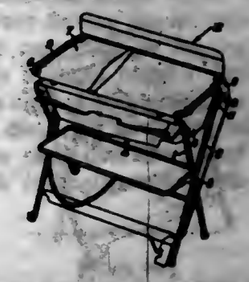
1. A collar construction comprising a bottom ply, cushion means secured to said bottom ply at each end of said collar, each of said cushion means comprising a soft cloth fabric piece seated against said bottom ply and conforming to said end configuration, a piece of regular shirting of lesser area than the soft cloth fabric piece next adjacent said soft cloth fabric piece, and said cushion means also comprising a strip of tape secured to said soft cloth fabric piece opposite said piece of regular shirting, spaced lines of stitching joining said strip of tape to said soft cloth fabric piece to provide a stay receiving pocket, and lines of stitching securing said assembly to said bottom ply.

**2,769,980**
**PROTECTIVE SHIELDS**
**Jeannette Fleischer, Bloomfield, N. J.**
**Application June 4, 1954, Serial No. 434,501**
**2 Claims. (Cl. 2—174)**

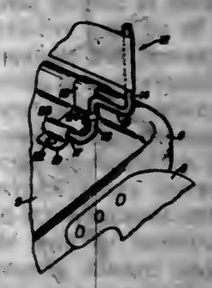
1. A protective shield comprising a sheet of heat resistant material, said sheet having a pair of lobes along one edge thereof, each lobe being folded upon itself and fastened in said folded position to form a pocket for engagement with the upper part of the ear of the wearer, said pockets being in inverted position when the shield is worn by the user.

**2,769,981**
**CONDENSATE INHIBITING LINER FOR TOILET FLUSH TANKS**
**Richard C. Jaye, Watertown, Wis., assignor to The Jaye Corporation, Watertown, Wis., a corporation of Wisconsin**
**Application November 10, 1953, Serial No. 391,179**
**3 Claims. (Cl. 4—10)**

1. A heat insulating liner for the interior of a toilet flush tank, characterized by: complementary panel sections each covering one side wall and substantially one-half of the front wall of the tank from the bottom thereof to a level higher than the normal level of water in the tank, each of said panel sections being of cellular plastic material having good heat insulating characteristics and the rigidity of which increases with the thickness thereof, said panel sections having a thickness which normally renders them substantially rigid and incapable of being bent around corners, and each having a solid portion which edgewise meets that of the other panel section substantially at a central zone of the front wall of the tank, and an end portion consisting of a plurality of substantially thin independently flexible laminations flatwise overlapping one another and together comprising the thickness of the panel section, the inner portions of said laminations being integrally joined to the solid portion of the panel section and overlying portions of the front wall of the tank inwardly from the adjacent upright corner of the tank, said laminations on both panel sections being of the same length and being bent around the upright front corners of the tank to substantially conform to the shape thereof and closely overlying and covering the interior surfaces of the side walls of the tank with their free ends contiguous to the back wall of the tank; further characterized by the provision of a back wall panel of similar cellular heat insulating material, flatwise overlying the inner surface of the back wall, and confined lengthwise between the free end portions of the laminations of said complementary panel sections to hold said end portions thereof in the rear upright corners of the tank; further characterized by the provision of panelling of similar cellular heat insulating material flatwise overlying the inner surface of the bottom wall of the tank and confined between the lower edge portions of the back, front and side wall panelling to hold said back, front and side wall panelling against separation from the tank walls covered thereby; and further characterized by the fact that all of said panelling is exposed at the interior of the tank.



**2,769,982**
**PORTABLE MINIATURE URINAL**
**John R. Gossett, Orange City, Fla., assignor of one-half to Corrine E. Gossett, Orange City, Fla.**
**Application November 20, 1950, Serial No. 196,673**
**1 Claim. (Cl. 4—110)**

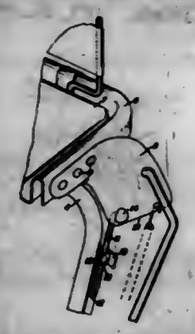


A portable trainee-type urinal for use by children in the home and, if desired, in an automobile or the like comprising a portable small-sized sheet material cabinet extremely light in weight and such that it may be easily picked up, handled and hand-carried from place to place, said cabinet being rectangular in general shape and cross-section, said cabinet being self-standing partially open at the back and embodying a flat bottom wall, flat vertical side walls and a flat top wall all of the same cross-sectional size, and a flat front wall, a vertically disposed semi-circular splash shield supported within the enclosing confines of said walls and provided at its lower portion with a horizontal dished liquid trapping and disposal basin vertically spaced above said bottom wall, said top wall covering the upper end of said shield and overlying said basin and being in vertically spaced relation and providing a balanced carrying handle, said front wall having opening means exposing said shield and basin, the vertical edge portions of said opening means projecting partly over and beyond the adjacent edge portions of said shield and the lower edge portion of said opening means projecting to a plane above said basin, a shelf fixed in the lower portion of said cabinet, located directly beneath said basin, and spaced above said bottom wall, guide means mounted atop said shelf, and a slidable liquid trapping and disposal drawer mounted on said shelf and held in a liquid receiving and collecting position beneath said basin by said guide means said drawer being removable for dumping by way of an opening provided therefor in said front wall, and said basin having drainage holes therein located above and in proper drainage relation to said drawer.

**2,769,983**
**DRESSING TABLE SCREEN GUARD SUPPORTING MEANS FOR INFANT'S BATH STAND**
**Chester C. Skirvin, Rochester, N. Y., assignor to Trimble, Inc., Rochester, N. Y., a corporation of New York**
**Application October 13, 1954, Serial No. 462,065**
**3 Claims. (Cl. 4—177)**

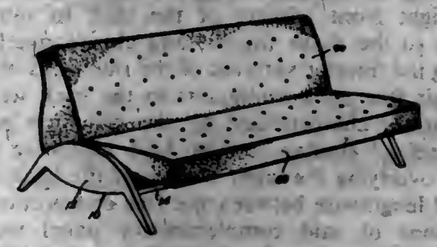
1. In an infant's bath stand and dressing table of the type comprising a folding cross-legged tub supporting stand consisting of pivotally connected front and rear leg frames, a dressing table including a rectangular metal frame including front and rear bars of tubular cross section pivotally mounted and swinging about the ends of the rear leg frame and arranged to fold downwardly and forwardly of the front leg frame when the leg frames are collapsed, the dressing table thus acting to hold the leg frames in folded relation, and a screen guard pivotally supported on the dressing table frame, the improvement which consists in a wire screen guard frame of less length than the dressing table frame and including U-shaped gripping portions in parallel relation spaced from the ends of the dressing table frame and releasably engaging the rear bar of the dressing table frame at points spaced from the ends thereof to retain the screen guard frame in upright position, said screen guard frame terminating in inwardly extending supporting trunnions, and brackets attached to the rear bar of said dressing table frame at points spaced from the ends thereof and having bearing portions engaged by said trunnions.

**2,769,984**
**SCREEN GUARD STRUCTURE FOR METAL DRESSING TABLE OF INFANT'S BATH STAND**
**Chester C. Skirvin, Rochester, N. Y., assignor to Trimble, Inc., Rochester, N. Y., a corporation of New York**
**Application October 13, 1954, Serial No. 462,066**
**5 Claims. (Cl. 4—177)**



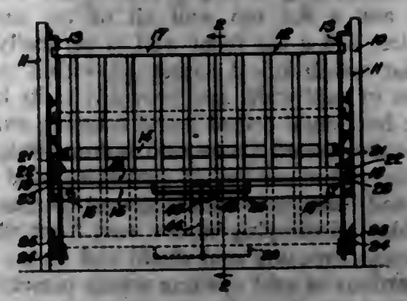
1. In an infant's bath stand and dressing table of the type comprising a folding tub supporting stand, a dressing table comprising a metal body having an upstanding curved rim around its edges, and a screen guard pivotally supported on the dressing table, the improvement which consists in a wire screen guard frame comprising parallel ends terminating in right-angled pintles extending inwardly toward each other immediately above said body of the dressing table, and rigid straps attached to said dressing table, said straps including rear attaching portions surrounding and embracing said rim and front attaching portions extending over and in contact with said body of the dressing table, said front portions including loops constituting bearings that receive said pintles.

2,769,985
ARTICLE POCKET FOR INFANT'S FOLDING BATH STAND
Chester C. Skirvin, Rochester, N. Y., assignor to Trimble, Inc., Rochester, N. Y., a corporation of New York
Application October 13, 1954, Serial No. 462,067
2 Claims. (Cl. 4—177)



1. In an infant's folding cross-legged bath stand comprising pivotally connected front and rear leg frames having top rails, a fabric tub suspended between the leg frames on the top rails, and a towel rod pivotally mounted on the front leg frame, the improvement which consists in the fabric article pocket having a rear wall coextensive in length with the tub and attached at its upper edge throughout its length to the fabric tub along a line beneath and in rear of the top rail of the front leg frame, the article pocket including a front wall coextensive in length with the rear wall and attached at its ends to the ends of said rear wall, said front wall being spaced between its ends from the rear wall and having its top edge located substantially beneath the top of said rear wall, the bottom of the article pocket being located beneath the top of said front wall and beneath said towel rod, and the front wall of the pocket being provided at its central portion with means extending thereabove and connected to the towel rod.

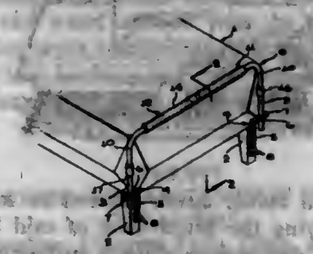
2,769,986
DRESSING TABLE SUPPORTING MEANS FOR INFANT'S BATH STAND
Chester C. Skirvin, Rochester, N. Y., assignor to Trimble, Inc., Rochester, N. Y., a corporation of New York
Application October 13, 1954, Serial No. 462,068
2 Claims. (Cl. 4—177)



1. In an infant's folding bath stand and dressing table including a metal leg frame having rounded corners at the upper ends of the legs, a dressing table, and hinge plates secured to the ends of the dressing table, and spaced laterally from said rounded corners, the improvement which consists in supporting posts extending parallel to the adjacent legs and including inwardly bent lower ends engaging openings in the legs below said rounded corners, fastening means intermediate the ends of the posts securing the posts to the legs, and outwardly bent trunnions at the upper ends of the posts spaced laterally from the adjacent rounded corners of the legs and pivotally connected to and supporting said hinge plates.

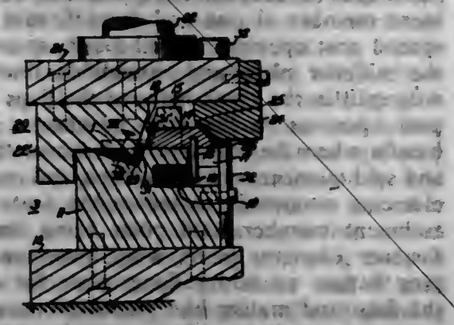
2,769,987
SOFA BED
Harry A. Thal, Kew Gardens, N. Y.
Application October 28, 1955, Serial No. 543,389
3 Claims. (Cl. 5—37)

1. A sofa bed comprising spaced parallel end members, spaced parallel side rails carried by said end members and extending therebetween to define a bed frame, quadrant plates mounted on adjacent faces of the end members for movement in spaced vertical arcuate paths about a common axis which lies parallel with and above the side rails, each plate having an arcuate row of circumferentially spaced openings extending therethrough in concentric spaced relation to the common axis, each end member having an arcuate row of circumferentially spaced recesses opening into adjacent faces thereof, the rows of recesses lying in concentric spaced relation to the common axis, arms pivotally mounted on the end members for movement about the common axis adjacent the quadrant plates, a first cushion frame carried by the quadrant plates and extending therebetween for movement therewith about the common axis in a vertical arcuate path between the end members, a second cushion frame carried by the arms for movement therewith about the common axis in a vertical arcuate path between the end members, bolts carried by the second cushion frame for projection through selected openings in the quadrant plates to hold the second cushion frame at a selected position relative to the first cushion frame, bolts carried by the first cushion frame for entering selected recesses in the end members and holding the cushion frames in a selected position relative to the bed frame, and cushions carried by the cushion frames.

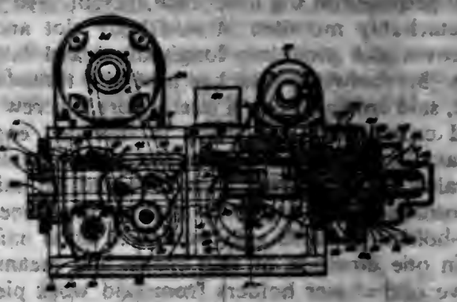


2,769,988
CRIB MUSIC BOX CONTROLLED BY DROP SIDE OF CRIB
Victor J. Bukolt, Stevens Point, Wis.
Application October 19, 1953, Serial No. 386,755
3 Claims. (Cl. 5—317)

1. The combination of a crib having end members connected by a stabilizing bar, a slidable drop side with guiding means therefore on the end members, said drop side being movable vertically with respect to the stabilizing bar from a lowered position in which the crib is open and the bottom of the drop side is below the stabilizing bar to an elevated position in which the crib is closed and the bottom of the drop side is above the stabilizing bar, a music box mechanism mounted on said stabilizing bar and having a spring driven winding drum and a pull cord to wind up its spring when the cord is pulled out of the box, and means detachably connecting the free end of the pull cord to the bottom portion of said drop side, the construction and arrangement being such that when the drop side is moved to its lowered open position the cord will be pulled out of the box and held taut to prevent operation of the music box, and when the drop side is then moved to its elevated closed position, the cord will be slackened and the music box will operate until the slack in the cord is taken up.



2,769,989
BEDCLOTHES ANCHOR
George H. Woodford, Lexington, Va.
Application January 22, 1954, Serial No. 405,562
2 Claims. (Cl. 5—320)

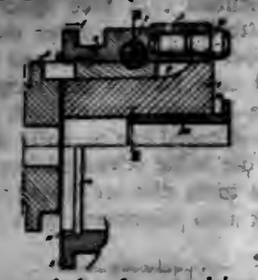


1. In a bed, a frame having legs at one end thereof, a bracket on each of said legs, a vertical rod for each bracket having an upper end, means releasably mounting each rod on a related bracket for vertical adjustment relative thereto, an inverted U-shaped frame having depending bars having lower ends, said U-shaped frame having a bight portion extending between said bars, pivot means pivoting the lower ends of said bars to the upper ends of said vertical rods to swing on an axis extending along said one end of the bed frame from an erect operative position to a pendant inoperative position, holding means acting between said rods and said bars for holding said frame in erect position, and a resilient friction covering on said bight portion for frictional holding engagement with bed clothes on said one end of the bed frame.

2,769,990
WEDGE NUT FORGING MACHINE
Ruben L. Pawsat, Maysville, Ky.
Application June 15, 1953, Serial No. 361,571
1 Claim. (Cl. 10—76)

A machine for forming a wedge nut from a flat metal blank of tear drop shape which comprises a lower main die member having an upwardly facing cavity therein of right angle shape in vertical section having a wedge-shaped portion of substantially semi-circular cross section and expanding in conic form toward the angle and an inclined wall at the large end of the wedge-shaped portion, a yoke mounted on the lower main die adjacent the wall of the cavity and having a horizontal guide opening therethrough extending lengthwise of the axis of the die cavity, an upper main die member having a downwardly extending projection complementary in form to that of the recess and of less extent in said vertical section and engageable with the blank, means for bringing the main dies toward each other to cause the projection to drive the blank into the cavity with the wide end of the blank engaging said wall and to shape the blank in the die cavity, a reciprocating die member mounted in and slidable along said guide opening, said reciprocating die member having a die face parallel to the wall of the cavity and an inclined cam face spaced therefrom, a pusher member attached to the upper main die member, said pusher member having an inclined face engageable with the inclined cam face of the reciprocating die as the main dies are brought toward each other and after the projection has engaged and partially shaped the blank, the reciprocating die being advanced into alignment with the wall when the main dies are closed to bend the wide end of the blank into alignment with the wall of the die cavity.

2,769,991
THREADING MACHINE HAVING SPINDLE FEED MEANS AND SPINDLE RETURN MEANS
Charles H. Lasmanel, Dayton, Ohio, assignor to The Sheffield Corporation, Dayton, Ohio, a corporation of Ohio
Application November 18, 1952, Serial No. 321,145
11 Claims. (Cl. 10—89)

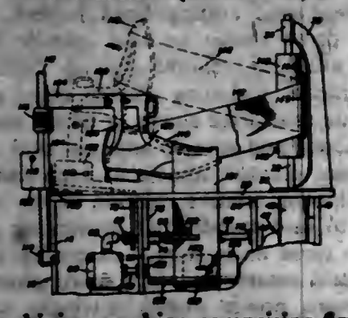


1. A threading machine comprising a threading unit and a workpiece holder, said threading unit comprising a tool holding spindle, means slidably and rotatably supporting said spindle in said threading unit, a holder for a collapsible cutting head fixed to the outer end of said spindle, a driving sleeve fitted coaxially about said spindle adjacent said cutting head holder, means connecting said drive sleeve to said spindle for rotation thereof but allowing relative sliding therebetween, a power drive means including change speed gearing connected to rotate said drive sleeve, a return sleeve coaxially mounted about said spindle adjacent said drive sleeve, abutment means on said spindle at each end of said return sleeve allowing relative rotation of the return sleeve with respect to said spindle but preventing axial movement between these units, a rack extending axially along one side of said return sleeve, a drive pinion engaging said rack, return power means drivingly connected to said pinion, a lead screw mounted on the inner end of said spindle and removably fixed thereto, lead nut segments about said lead screw, means mounting said lead nut segments in said unit in removable relationship thereto and for movement toward and from said lead screw, resilient means urging said lead nut segments radially outward from said lead screw, an annular cam means about the radially outward portions of said lead nut segments for positively engaging said lead nut segments with said lead screw, adjustable limit projections carried by said return sleeve as it moves axially with said spindle during a threading operation, control means for moving said cam means to release said lead nut segments and actuating said return means, in that sequence, after a threading operation, switch means actuated by said adjustable limit projections and connected to said control means for energization thereof at the selected limits of spindle travel determined by said adjustable limit projections.

2,769,992

## SELECTIVELY POSITIONED CAM MEANS FOR OPERATING PIVOTED CHASER CARRIERS

Roland Hoffherr, Bagny, Brasc, France
Application July 11, 1952, Serial No. 298,413
Claims priority, application France July 13, 1951
3 Claims. (Cl. 10—160)



1. A screwing stock head comprising an annular body having a central opening for supporting the workpiece therethrough, a plurality of chaser-holders pivotally mounted on said body around said opening, a crown positioned around said body and rotatably supported thereon for moving circumferentially of said body, said body having a longitudinal slot provided in the periphery thereof, said crown having an annular laterally extending slot provided in the inner face thereof, a key slidably and detachably mounted in said body slot and also in said crown slot providing longitudinal and lateral connection therebetween, said key having a threaded lateral section, said crown having a lateral bore, a screw mounted in said crown bore and being in threaded engagement with said key threaded section for rotating said crown, a plurality of abutments each mounted on said crown and positioned for engaging and pivoting one of said chaser-holders towards said workpiece upon axial movement in one direction of said crown and means tending to move said chaser holders from said work piece when said abutments are moved from said chaser holders.

2,769,993

## SHOE SHINING MACHINE

Serafin S. Fernandez, Las Vegas, Nev.
Application December 4, 1952, Serial No. 323,981
3 Claims. (Cl. 15—97)

3. A shoe shining machine comprising first and second rollers having longitudinal axes disposed normal to each other, drive means simultaneously oscillating said rollers through limited angles about said axes, means carried by said rollers in circumferentially spaced relation for attaching polishing cloths to said rollers, polishing cloths having opposite ends connected to said rollers by said last mentioned means, said polishing cloths being disposed at substantially right angles to each other and in partial overlapping relation to form a T arrangement.

2,769,994

## WAX APPLICATORS

Otis E. Sutton, North Canton, Ohio, assignor to The Hoover Company, North Canton, Ohio, a corporation of Ohio
Application January 5, 1954, Serial No. 402,251
9 Claims. (Cl. 15—98)

1. A wax applicator comprising a disc-like body having a lower face provided with circumferentially spaced depressions adapted to be charged with wax, a plurality of circumferentially spaced radial ribs projecting from the upper face of said body, a central hub projecting from the upper face of said body, attaching means on

said hub, and a textile cover secured to said body and normally overlying the lower face of said body to feed wax from said depressions onto a surface contacted by said cover.

2,769,995

## HOUSEHOLD SPONGE CLEANING DEVICE

Michael Klein, New York, N. Y.
Application March 10, 1954, Serial No. 415,220
1 Claim. (Cl. 15—244)

A mop and cleaning device comprising an absorbent and resilient elongated block having an upper face, said block being centrally split lengthwise from the upper face to a point less than the depth of the block and transversely split at such point of depth less than the width of the block to form two centrally disposed foldable flaps, a rigid stiffener plate removably disposed in the transverse split beneath the flaps, a handle with a mop attachment member at one end thereof, said member having spaced post openings therethrough, spaced posts fixed to the stiffener plate and extendable through the lengthwise split in the block between the flaps and through the post openings in the mop attachment member of the handle when the flaps are folded over the stiffener plate and said member is over the flaps, and removable fastener elements removably to secure the posts to the mop attachment member, said posts being threaded and said fastener elements being wing nuts, spaced raised gripping flanges on said stiffener plate for disposal beneath the flaps and mating like spaced grooves on the mop attachment member, said mop attachment member having raised annular portions around said post openings to locate said wing nuts by touch as well as by sight.

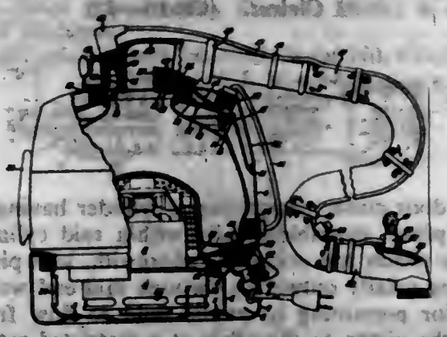
2,769,996

## MOBILE VACUUM CLEANER HAVING A HOSE ADAPTED TO BE USED AS A PUSHING OR PULLING MEANS THEREFOR

John C. Shalvoy, Fairfield, and Paul O. Rawson, Jr., Trumbull, Conn., assignors to General Electric Company, a corporation of New York
Application December 21, 1953, Serial No. 399,271
5 Claims. (Cl. 15—323)

1. A vacuum cleaner comprising a casing having a suction inlet, wheels on the casing for supporting it and on

which it may be moved, a suction hose comprising a flexible section and a rigid wand section, the end of the wand section being provided with latch means for connection of cleaning tools thereto, means connecting the end of the flexible section to the suction inlet, a handle forming ledge adjacent to the said suction inlet, and

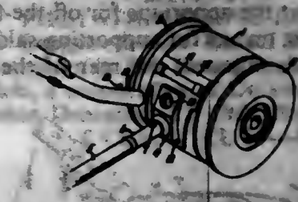


walls including a wall portion which is a part of said handle forming ledge which defines a pocket into which the end of the wand section may be positioned, said pocket forming walls comprising latch means for engagement by the tool latching means at the end of the wand section for fastening the wand section in the pocket.

2,769,997

## ELECTRIC CORD ARRANGEMENT FOR VACUUM CLEANERS

Robert E. Sheahan, Chagrin Falls, Ohio, assignor to General Electric Company, a corporation of New York
Application July 9, 1953, Serial No. 366,917
1 Claim. (Cl. 15—324)

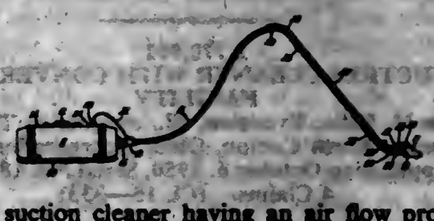


In a vacuum cleaner, an enclosure comprising side walls and a removable cover, a power unit in the enclosure comprising an electric motor and a suction fan, an inlet nozzle carried by the cover, a plug receptacle carried by the nozzle, wiring including a detachable electrical connection connecting the plug receptacle in parallel with said electric motor, said electrical connection being disposed to enable separation of said cover and said side walls, a suction hose connected at one end to the inlet nozzle, its other end being provided with a cleaning tool fitting, an electric cord which extends longitudinally of and is carried by said suction hose, an electric plug at one end of said cord for connection to said plug receptacle, a cleaning tool detachably connected to said cleaning tool fitting, a plug body attached to the other end of said electric cord, said cord having a free section adjacent said tool fitting and carrying said plug body at the free end thereof, means on the outer wall of said cleaning tool spaced from the connection of said cleaning tool fitting and said cleaning tool and adapted to receive and support said plug body, and an electric lamp carried by said plug body connected to the conductors of said electric cord.

2,769,998

## MOBILE VACUUM CLEANER HAVING A HOSE ADAPTED TO BE USED AS A PUSHING OR PULLING MEANS THEREFOR

James P. Hunter, Southport, Conn., assignor to General Electric Company, a corporation of New York
Application December 21, 1953, Serial No. 399,270
7 Claims. (Cl. 15—327)



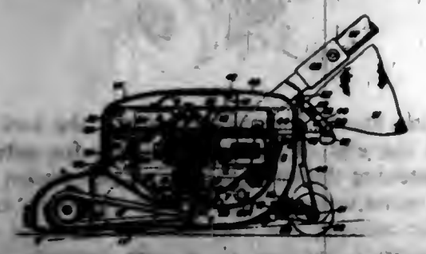
1. A vacuum cleaner comprising a casing having a suction inlet, wheels on the casing for supporting it and on which it may be moved, a suction hose comprising a flexible section and a rigid wand section, the end of the wand section being provided with latch means for connection of cleaning tools thereto, means connecting the end of said flexible section to the suction inlet, and said cleaner having means forming a pocket adjacent to said suction inlet into which the end of said wand section may be positioned, said pocket forming means comprising latching means for engagement by the tool latching means at the end of the wand section for substantially rigidly fastening the wand section in said pocket whereby when the wand section is fastened in the pocket it forms a handle for moving the cleaner on its wheels with the flexible section hanging in a loop beneath the wand section.

2,769,999

## SUCTION CLEANER HOSE AND HANDLE ARRANGEMENT

Robert E. Sheahan, Chagrin Falls, Ohio, assignor to General Electric Company, a corporation of New York
Application May 22, 1953, Serial No. 356,721
2 Claims. (Cl. 15—327)

2. In a suction cleaner having an air flow producing body, an elongated flexible air hose connected to said body, a cleaning tool attached to the end of said hose remote from said body, and a detachable handle for manipulating said tool and rendering substantially rigid a portion of said hose near the end adjacent said tool, said handle including a rigid elongated unitary member extending from the tool connected end of said hose to a point remote therefrom and located approximately at the hand position of the user, said member being curved at its upper end to form a gripping portion and curved in the reverse direction at its lower end, said member being secured to said hose by at least four spring clips, at least one of said clips being rigidly secured at each end of said member and the remainder of said clips being rigidly secured to the central portion of said member and with at least one of said clips of said remainder fixed at a point near the inner end of the curvature of each of said curved portions.

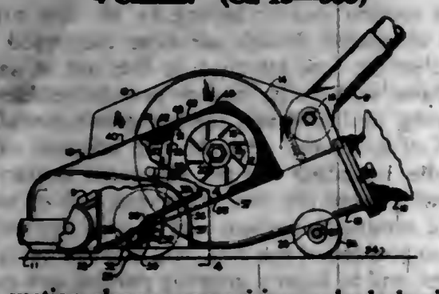


2,770,000

## SUCTION CLEANER HAVING AGITATOR DRIVE IN AIR STREAM AND UNOBSTRUCTED FAN INLET

Louis E. Sagerman, Canton, Ohio, assignor to The Hoover Company, North Canton, Ohio, a corporation of Ohio
Application September 3, 1953, Serial No. 378,246
4 Claims. (Cl. 15—333)

1. In a suction cleaner having a main body portion provided with a suction cleaning nozzle across the front thereof and a rotary cleaning device mounted in the nozzle, the combination of an electric drive motor carried by the body portion, a suction air fan driven by the motor, means forming a suction air duct for conveying dirt laden air from the nozzle to the fan, a drive pulley driven by the motor positioned in the air duct, a belt forming a driving connection between the pulley and

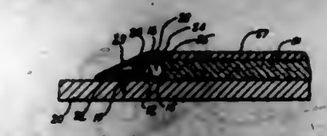


rotary cleaning device positioned in the air duct, said pulley and belt being so positioned in the air duct relative to the fan that said air duct includes an elongated section between the belt and pulley and the fan free of obstruction, said elongated section of the air duct including a removable portion providing for the insertion of a converting tool to interrupt communication between the fan and nozzle to convert the apparatus for off-the-floor cleaning, surface engaging means for supporting said body portion including wheels adjacent the rear of the body por-

tion, means mounting said wheels for movement relative to the body portion for adjusting the position of the nozzle relative to a supporting surface, means biasing said wheels downwardly to lower the nozzle relative to a supporting surface, a tension member engaged between said wheels and the removable portion of the air duct for limiting movement of the rear wheels by the biasing means to place the nozzle in a normal operating position and to hold the removable portion of the air duct in operative position.

---

**2,770,001**
**SUCTION CLEANER WITH CONVERTER FACILITY**
**William H. Kitto, Evanston, Ill., assignor to The Hoover Company, North Canton, Ohio, a corporation of Ohio**
**Application October 6, 1950, Serial No. 188,737**
**4 Claims. (Cl. 15—333)**



1. A suction cleaner comprising: a body having a nozzle for on-the-floor cleaning and a port adapted to receive a converter for off-the-floor cleaning, barrier means including first and second means pivotally mounted on said body for movement on axes transverse to each other and cooperating to span said port for closing the latter during on-the-floor cleaning, barrier control means on said body connected with said first means and movable to one position to shift the latter about its axis into engagement with said second means to maintain said first and second means in said closed position for on-the-floor cleaning, said control means movable to another position to shift said first means about its axis to partially uncover said port and out of said engagement with said second means to release the latter for subsequent movement about its axis to its open position by placing the converter thereon for insertion into said port for off-the-floor cleaning.

---

**2,770,002**
**CARPET GRIPPER MOLDING**
**Billy V. Thompson, Vicksburg, Miss.**
**Application December 28, 1954, Serial No. 478,067**
**1 Claim. (Cl. 16—7)**

A carpet edge-gripping assembly comprising a base strip adapted to be secured to the floor, an upstanding flange at one longitudinal edge of said base strip, said flange having a top portion extending parallel to and positioned above said base strip, the other longitudinal edge of said base strip being formed with a longitudinal recess, and a cover strip adapted to be engaged over said top portion to clamp the edge of a carpet therebe-

tween, said cover strip having a longitudinal rib element at its intermediate portion directed downwardly and inwardly toward said upstanding flange, whereby a portion of the edge of a carpet may be gripped between said rib element and the edge of said top portion, said cover strip being formed at its outer margin with an inturned longitudinal flange lockingly receivable in said recess.

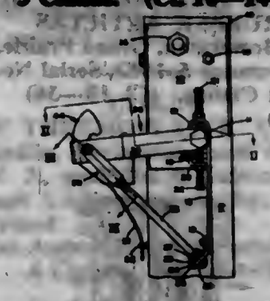
---

**2,770,003**
**HYDRAULIC DOOR CLOSER**
**Charles S. Causey, Pasadena, and Millard Francis Saxton and Henry C. Stewart, Flint, Mich., assignors to The Engineered Products Co., Flint, Mich., a corporation of Michigan**
**Application July 26, 1951, Serial No. 238,731**
**11 Claims. (Cl. 16—52)**

1. A door closer comprising a cylinder having an end wall, a piston movable axially within said cylinder and having a piston rod connected therewith, said piston rod projecting axially outwardly through said end wall, valve means for permitting hydraulic fluid to flow from one side of the piston to the other at a restricted rate as the piston is moved axially of the cylinder in one direction, check valve means for permitting free flow of fluid across the piston when the piston is moved axially in the opposite direction, said cylinder having an end wall at the end thereof opposite said first mentioned end wall, said last mentioned end wall being movable generally axially of the cylinder to increase and decrease the effective volume of the cylinder between said piston and said last mentioned end wall.

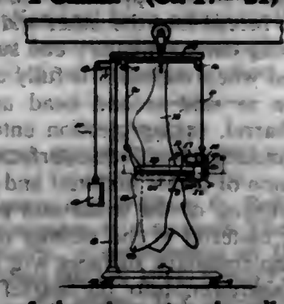
---

**2,770,004**
**DOOR CLOSER MECHANISM**
**Martin Carlson, Brookfield, and Edward G. Brubaker, La Grange Park, Ill., assignors to George W. Housby, Jr., Chicago, Ill.**
**Application March 5, 1952, Serial No. 274,894**
**4 Claims. (Cl. 16—55)**



1. In a door closer mechanism, a vertical operating spindle adapted to extend above the floor level in the swinging axis of the door and a horizontal arm for attachment to the door and spindle and movable with the spindle about the vertical axis thereof, said spindle being provided with opposed flat faces at the upper portion, said arm having a head provided with a vertical recess open at the lower side of the head for receiving said upper portion of the spindle, said recess being of greater cross sectional area than the cross sectional area of the upper end portion of the spindle and being so shaped to enable said recess to receive said portion of the spindle when the head is lowered upon the spindle in tilted relation thereto in an angular direction with respect to the normal plane of the door, said recess being generally cylindrical and provided at one side thereof with an extension terminating in a flat wall of a width enabling the head to be shifted upon the spindle to move said flat wall into contacting relation with one of the flat faces of the spindle, an adjusting screw in a threaded opening in the wall of the recess opposed to said flat wall and adapted to be tightened against the other flat face of the spindle to shift the head and arm transversely of the spindle for pressing said flat wall of the recess firmly against the first-mentioned flat face of the spindle and clamping the head to the spindle against relative movement in directions normal to said flat wall of the recess, and means for preventing shifting of the head on the spindle in directions parallel to said flat wall comprising wall portions adjacent said flat wall at each longitudinal edge thereof and providing abutments for opposed surface portions of the spindle when said screw is tightened.

---



**2,770,005**
**IMPROVED MOUNTING CONSTRUCTION FOR OVERHEAD DOOR LATCH**
**Wesley A. Smith, West Palm Beach, Fla., assignor to Tilt-A-Door Corporation, Detroit, Mich., a corporation of Michigan**
**Application March 24, 1955, Serial No. 496,436**
**5 Claims. (Cl. 16—146)**

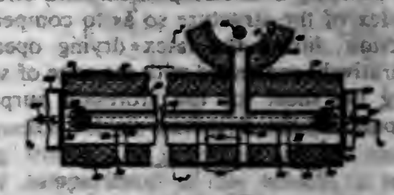
1. In an overhead, horizontally pivoted, door construction, including a door frame, a hinge pin on said door and a latch for said door, the combination, with said door construction, of an improved mounting construction for said latch, comprising: an arm having one of its ends pivotally mounted on said hinge pin; means adjacent to said door frame and fixed with respect thereto for adjusting the vertical position of said hinge pin and said one end of said arm relative to said door frame; said latch being mounted on the other end of said arm; means engaging said other end of said arm for pivoting said arm to cause same to assume different positions of angularity with respect to said door frame.

---

**2,770,006**
**HIDE-STRIPPING DEVICES**
**Ernst H. Willeke, Milwaukee, Wis.**
**Application June 8, 1955, Serial No. 513,939**
**1 Claim. (Cl. 17—21)**

In a device of the character described, a horizontal frame mounted for vertical movement, a pair of horizontal opposed troughs, a plurality of cylindrical resilient rolls disposed in two chains rotatable within said troughs, for receiving therebetween a hide to be pulled from a carcass hanging within said frame, and knife means on one trough adapted to cut the hide from said carcass.

---

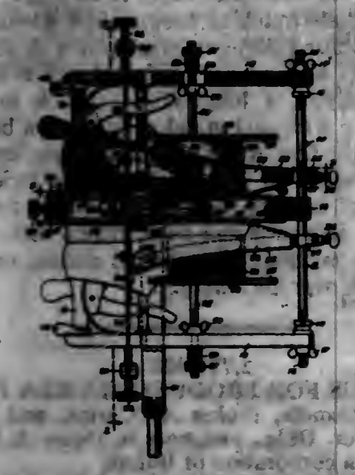


**2,770,007**
**FILM STRETCHING DEVICE**
**Murrey O. Longstreth and Daniel W. Ryan, Midland, Mich., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Delaware**
**Application December 22, 1952, Serial No. 327,362**
**1 Claim. (Cl. 18—1)**

In an apparatus for stretching previously unoriented tubular film both laterally and longitudinally comprising a spreader mandrel having two parallel plane sides lying between outer edges which diverge symmetrically from the end at which film is fed to said mandrel, of a length, and disposed with said outer edges at an angle, to provide the desired radial stretch to tubular film advanced thereover; freely rotating film-engaging rollers disposed along the outer edges and on both sides of the mandrel; and means for applying a longitudinal stretch to the film; the combination with said mandrel, at a point beyond that at which tubular film formed thereover attains its maximum radial stretch, of film-slitting means rigidly affixed to each edge of each of said plane sides of the mandrel and within the film tube and close to said rollers and disposed so as to maintain longitudinal cutting engagement with film drawn over the mandrel.

---

**2,770,008**
**APPARATUS FOR PRODUCING UREA PRILLS**
**William W. Yeandle, Nolan A. Carter, and James T. Parnell, Pryor, Okla., assignors to Deere & Company, Moline, Ill., a corporation of Illinois**
**Application July 14, 1954, Serial No. 443,204**
**15 Claims. (Cl. 18—2.4)**



1. In apparatus of the class described, a header pipe, a generally horizontal sparger pipe connected thereto, said sparger pipe having a row of orifices in the bottom thereof, a heat storage casing enclosing said sparger pipe and having an inner surface in contact with a major portion of the outer surface of said sparger pipe to permit transfer of heat by conduction therebetween, and an insulating cover on the outside of said casing, said casing and cover having enlarged passages aligned with said orifices to provide for escape of liquid from said sparger pipe.

2,770,009
**TUBE COOLING BLOWER**
Edward H. Regal and Arthur Martynec, Shawinigan Falls, Quebec, Canada, assignors to Du Pont Company of Canada Limited, Montreal, Quebec, Canada, a corporation of Canada
Application February 3, 1955, Serial No. 485,967
Claims priority, application Canada December 15, 1954
4 Claims. (Cl. 18—14)

1. An apparatus adapted to direct an even stream of gaseous cooling medium upon extruded tubing made of a thermoplastic material as said tubing issues from extrusion apparatus, said apparatus comprising a rotatable radial flow turbine and means to direct a succession of streams of said cooling medium inwardly upon the blades of said turbine.

2,770,010
**SHOE BOTTOM PRESS**
William H. Doherty, Rego Park, N. Y.
Application December 27, 1951, Serial No. 263,637
4 Claims. (Cl. 18—17)

3. In a device for completing a unitary heel and sole structure of gelled latex on a shoe, a sheet of stretchable material for exerting a lateral pull on said structure to spread the latex of the structure so as to compensate for shrinkage action during the latex drying operation, a stretcher operatively connected with the edge of said sheet for stretching the sheet for the aforesaid purpose, and means for operating the stretcher.

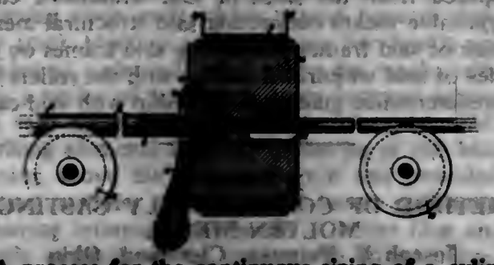
2,770,011
**DIE CONSTRUCTION FOR INJECTION-TYPE MOLDING MACHINES**
George W. Kelly, Columbus, Ohio, assignor to Columbus Plastic Products, Inc., Columbus, Ohio, a corporation of Ohio
Application December 15, 1951, Serial No. 261,871
3 Claims. (Cl. 18—30)

1. In an injection molding machine; a die having a molding surface and passage means through which plastic materials may be forcibly passed to said molding surface; said passage means terminating in a discharge orifice at said molding surface and embodying a plurality of relatively angularly disposed branches; injection means for forcing plastic material through said passage means toward the discharge orifice thereof; a sprue cut-off pin movably mounted in said die in axially spaced relation to said injection means and having an outer end, said pin normally extending into said passage means in axial alignment with

but in spaced relation to the discharge orifice thereof; and means independent of said injection means for moving said pin in the general direction of flow of plastic material toward said discharge orifice and to a position at which said pin closes the orifice of said passage means and is disposed in substantially flush relation to said molding surface.

2,770,012
**APPARATUS FOR AND METHOD OF MOLDING RUBBER ARTICLES**
Hulie E. Bowerman, Grand Prairie, Tex.
Application January 5, 1953, Serial No. 329,660
11 Claims. (Cl. 18—36)

3. A high-pressure mold for molding a substantially tubular product from an uncured blank of rubber-like material comprising a barrel adapted to shape the outer portion of the product; a short mandrel and a long mandrel to form when mated a core in the mold; a pair of heads to close said barrel, a first head supporting the short mandrel and being initially fixed at one end of said barrel, and a second head supporting the long mandrel and adapted to be forced into the other end of the barrel, said mandrels having complementary end surfaces mating near said first head when the mold is fully closed; and an annular projection in said second head and shaped to slide inside said barrel, said projection entering into the barrel before the mating of said end surfaces to close the barrel after expulsion of excess material and of air, whereby upon further closing of the mold said projection will end-pressurize the material in the vicinity of said second head and said complementary surfaces will mate to force the material therebetween into the barrel portion and thereby simultaneously pressurize the material in the mold in the vicinity of said first head.

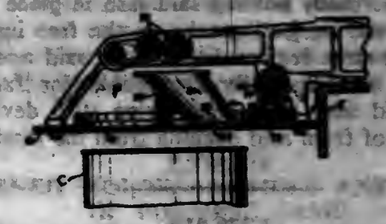


2,770,013
**STUD HOLDERS FOR USE IN TIRE MOLDS**
David E. Crocker, Ontonagon, Mich., assignor of one-half to Lloyd L. Folker, Marshfield, Wis.
Application February 28, 1951, Serial No. 213,140
7 Claims. (Cl. 18—36)

1. In a tire mold, a circular matrix having an internal peripheral portion adapted to form a road engaging surface on a tire, said portion having a plurality of threaded holes therein, a plurality of stud holders each having a portion removably threaded within one of said holes and each stud holder having another portion projecting inwardly from said internal peripheral portion of the matrix, said last-mentioned portion of each holder being bored to a substantial depth to provide an elongated open ended socket for receiving a portion of the length of the shank of a stud with the remaining portion projecting freely, and means in connection with said socket constituting the sole means for normally releasably retaining said shank therein and for retaining the projecting portion in rigid projecting position, said socket including means for determining the amount of the length of the shank which is received in said socket.

2,770,014
**SIZING OF THERMOPLASTIC CABLE CORES**
Henry G. Nerville, Livingston, and Paul M. Kourner, Paterson, N. J., assignors to International Telephone and Telegraph Corporation, Nutley, N. J., a corporation of Maryland
Application August 25, 1953, Serial No. 376,493
6 Claims. (Cl. 18—48)

1. A process for the continuous sizing of a cylindrical form of thermoplastic material comprising passing said cylindrical form through a heated die whose sizing hole is maintained at a substantially uniform temperature along is axial length above the flow point of said thermoplastic material, the sizing hole of said die being of uniform bore and smaller normally than the diameter of said cylindrical form, and accumulating a body fluid of surplus thermoplastic material at the entrance to said die through which said cylindrical form must pass to thereby preheat and maintain the cylindrical form substantially centered within said die, and at least partially annealing said cylindrical form within said die at its output portion.



2,770,015
**METHOD FOR PRODUCING PELLICLES, FILMS, AND SHEETS**
Charles M. Reese and William O. Baldhart, Fredericksburg, Va., assignors to American Viscose Corporation, Philadelphia, Pa., a corporation of Delaware
Application June 5, 1952, Serial No. 291,956
4 Claims. (Cl. 18—57)

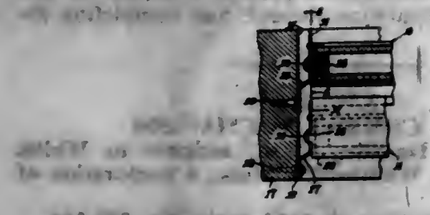
1. A process for drying pellicles which comprises the steps of positioning a plurality of wet gel pellicles in face-to-face contact, passing said contacting pellicles into a drying stage, separating said pellicles during the drying stage only after the moisture content thereof is less than

30% by weight, restoring said pellicles into face-to-face contact after the separation thereof, and completing the drying thereof.

2,770,016
**SLIVER COILING MECHANISM**
John S. Dudley, Douglas, Mass., assignor to Whitin Machine Works, Whitinsville, Mass., a corporation of Massachusetts
Application November 10, 1953, Serial No. 391,286
2 Claims. (Cl. 19—159)

1. In a sliver coiler, a rotated coiler head having structure providing a downwardly-inclined and converging sliver-delivery passage of substantially circular cross section, and said passage having its extreme lower end portion only provided with a sliver-locating lateral enlargement in a side wall portion of said passage and of limited angular extent only and at the following side of said passage, having reference to the normal direction of rotation of said coiler head, and said enlargement being substantially U-shaped in sectional plan adjacent the sliver-delivery locus, and being effective to maintain the delivery path of slivers of different diameters at a substantially uniform radial distance from the axis of the coiler head.

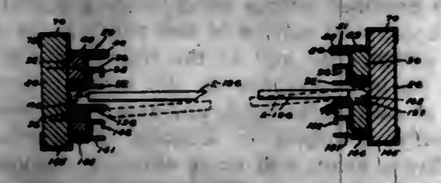
2,770,017
**WINDSHIELD WASHER SYSTEM**
John R. Oishei, Buffalo, and Henry C. Hoover, Snyder, N. Y., assignors to Trico Products Corporation, Buffalo, N. Y.
Application April 9, 1954, Serial No. 422,066
7 Claims. (Cl. 20—40.5)



6. A motor vehicle having a windshield, a rain water collecting trough for diverting surface rain from the passenger compartment of the vehicle, a reservoir into which the trough empties, and means for applying the liquid content of the reservoir to the windshield.

2,770,018
**WINDOW STRUCTURE**
John W. Seibert, Aurora, Ill., assignor to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois
Application November 17, 1953, Serial No. 392,689
2 Claims. (Cl. 20—52.2)

1. In combination, window sash adapted to be mounted in an opening formed in a building wall, said sash being



formed with a protruding bead on opposed sides thereof, means for mounting said sash in said opening and comprising metal spring strip devices disposed at opposed sides of said opening, each of said spring strip devices having a longitudinally extending channel substantially complementary to said bead and adapted to respectively receive one of said beads therein for slidably mounting the sash in said opening, said spring strip devices disposed

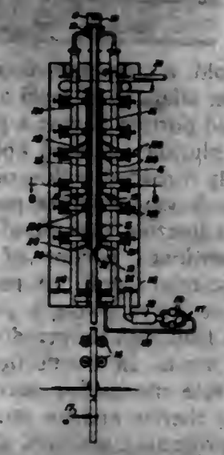
on one side of said opening having the outer edge only secured to the edge of said opening and thereby being resilient for normally holding said sash in place between said devices, and projecting tabs on the free inner edge of said spring strip devices disposed on said one side of said opening and manually depressible for facilitating release of said sash from said spring strip devices and removal thereof from said opening from the inside of the building.

---

**2,770,019**
**WINDOW FRAME ASSEMBLY**
**Joseph Sylvan, Berkley, Mich.**
**Application November 19, 1953, Serial No. 393,050**
**9 Claims. (Cl. 20—52.2)**

7. In a window frame assembly: a pair of opposed complementary jamb assemblies provided with an outer pair and an inner pair of opposed complementary sash runway channels, the inner pair of runway channels spaced inwardly along the jamb members from the outer pair of runway channels by a sash receiving channel space of a width not less than the width of an adjacent runway channel and of a depth not less than the depth of an adjacent runway channel.

---



**2,770,020**
**AWNING AND CANOPY STRUCTURES**
**Howard E. Zerbe, Du Bois, Pa.**
**Application August 26, 1953, Serial No. 376,722**
**3 Claims. (Cl. 20—57.5)**

1. An awning structure comprising a pair of spaced apart sloping water shedding surfaces one above the other, each of said surfaces made up of a plurality of spaced apart substantially parallel members having parallel openings therebetween, the members of one level lying in vertical alignment with the openings of the other level, a transverse slot in each said surface adjacent the lowermost edge extending from a point adjacent one side to a point adjacent the other side and formed by removing a narrow portion from each member in the same vertical plane, and gutter means connected to said surfaces beneath the slots receiving water therefrom and discharging said water to one side of the structure.

---

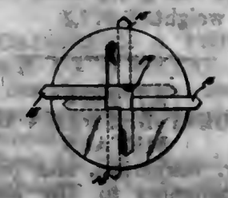
**2,770,021**
**METHOD OF AND APPARATUS FOR CONTINUOUS CASTING**
**Isaac Harter, Jr., and Temple W. Ratcliffe, Beaver, Pa., assignors to The Babcock & Wilcox Company, New York, N. Y., a corporation of New Jersey**
**Application October 23, 1952, Serial No. 316,446**
**7 Claims. (Cl. 22—57.2)**

1. Continuous casting apparatus including an upright liquid-cooled open ended mold, means for delivering molten metal to the upper end of said mold, pinch rolls for withdrawing a casting from the lower end of said mold, and guide means positioned adjacent the lower end of said mold and between said mold and pinch rolls for the casting withdrawn from said mold comprising, at least two frames, a plurality of rollers journaled in each of said frames and having their axes lying in a common plane in each frame, structural support members horizontally spaced from the sides of said withdrawn casting, and adjustable means connecting said structural members with each of said frames positioning said frames on opposite sides of said withdrawn casting with the rollers therein in predetermined guiding relationship with said casting.

---

**2,770,022**
**METHOD OF CONTINUOUSLY CASTING MOLTEN METAL**
**Joseph B. Brennan, Cleveland, Ohio**
**Application December 8, 1952, Serial No. 324,795**
**6 Claims. (Cl. 22—200.1)**

1. The method of continuously casting molten metal which comprises the steps of cooling successive longitudinal portions of a laterally confined, longitudinally flowing stream of molten metal of substantially uniform cross-section size and shape to a self-sustaining state, and heating the surface of successive longitudinal portions of the self-sustaining, laterally confined stream to melt at least a substantial portion thereof to provide a slippery skin thereon facilitating continued longitudinal, laterally confined flow of said stream.



---

**2,770,023**
**PRESS FASTENER**
**Peter Michalsky, Garfield, N. J.**
**Application August 6, 1954, Serial No. 448,315**
**1 Claim. (Cl. 24—153)**

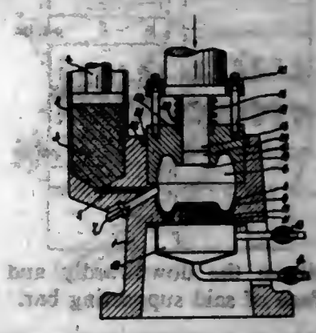
A paper fastener or the like formed of bendable sheet material with a central shear cut stopping a predetermined distance short of the outer edges of the material and with side cuts parallel to the center cut on opposite sides of the center cut, one extending from said distance

within the edge of the material to a point well beyond the center of the sheet and the other extending from said distance within an opposite edge to a point beyond said

center and a cut adjacent each of said opposite edges connecting the ends of the shear cuts adjacent each edge of the material to define oppositely extending prong outlines.

---

**2,770,024**
**TRACK FOR ADJUSTABLE FASTENING DEVICES**
**Noel Stadtman, New Canaan, Conn.**
**Application March 6, 1952, Serial No. 275,143**
**10 Claims. (Cl. 24—266)**



1. A track forming one member of an adjustable fastener of which the other member is comprised of a slider adapted to be secured to one of two parts to be adjustably secured together, said track comprising an integral band of tape-like material and upon which said slider is adapted to be slidably secured by virtue of an element of generally elliptical cross section adapted to embrace the longitudinal edges of the track and having open ends which extend beneath the edges of the track together with a clamp for fixedly securing the slider at a desired point along the track, said track having a series of transverse stops between adjacent of which said slider is adapted to be clamped, said stops comprising elements disposed crosswise of the band and projecting above the surface thereof and provided with clamping portions engaging said band, said stops further having interruptions therein at either face and substantially centrally of the band which afford a free space extending longitudinally of and through the band to accommodate continuous means for attaching said band to the other of said parts to be secured, the extent of said stops crosswise of the band being confined substantially to the transverse extent of said band, and the track having substantial rigidity in the transverse direction sufficient essentially to prevent escape of the track from the slider by transverse collapse of the track when the slider is applied to it, thereby affording smooth movement of the slider along said track.

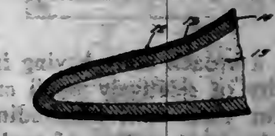
**2,770,025**
**DEVICE FOR THE MANUFACTURE OF CERAMIC MOULDINGS**
**Josef Möllers, Hamburg-Poppenbuettel, Germany, assignor to Hartford National Bank and Trust Company, Hartford, Conn., as trustee**
**Application April 26, 1952, Serial No. 284,625**
**Claims priority, application Germany June 9, 1951**
**4 Claims. (Cl. 25—27)**

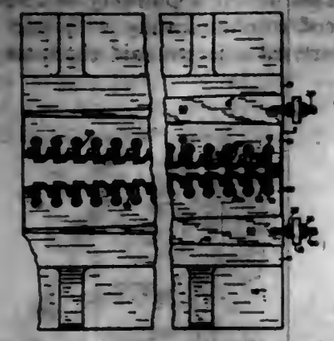


1. An apparatus for molding wet ceramic material comprising a vacuum-tight mold, means for introducing a wet batch of ceramic material into said mold, vacuum-tight valve means for controlling the introduction of ceramic material into said mold, a vacuum-tight receptacle, said mold having a plurality of channels in a wall portion thereof communicating with said receptacle, filter means disposed adjacent said channels for permitting

the passage only of gases or liquids, means connected to said receptacle for evacuating said receptacle and said mold, and means for applying pressure to said wet batch of ceramic material to simultaneously press out the liquid therefrom and shape said material.

---

**2,770,026**
**HARDENED MOLDED ARTICLE AND METHOD OF FORMING SAME**
**Hans Hermann Peterßen, Hamburg, and Erich Otto Zimmermann, Hamburg-Altona, Germany, assignors to Franz R. Lushas, New York, N. Y.**
**Application October 26, 1951, Serial No. 253,304**
**6 Claims. (Cl. 28—74)**



1. A method of manufacturing a hardened molded article of the type described, comprising the steps of forming a plurality of formable-form preserving and non-formable impregnable elongated elements in a comparatively loose web the individual elements of which are easily displaceable relative to another but remain in any displaced relative position; first molding the said web in conformity with the contours of a selected surface by bending the said individual elements out of the general plane of the web and displacing the same relative to each other; then subjecting the web, thus molded, to a preliminary hardening treatment; thereupon applying to one side of the molded web a comparatively heavy layer of a pasty material hardening when drying; and finally applying to the opposite side of the molded web at least one thin coat of a liquid substance hardening when drying, the forces of shrinkage developed by the said thin coat during the hardening thereof impeding any deformation of the web due to shrinkage of the said layer during the hardening.

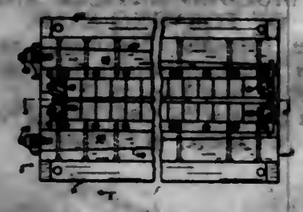
**2,770,027**
**BROACH WITH MULTIPLE CUTTING PLATES**
**Oliver W. Bonnafe, Hudson, Mass., assignor to The Lapointe Machine Tool Company, Hudson, Mass., a corporation of Maine**
**Application February 14, 1955, Serial No. 487,811**
**2 Claims. (Cl. 29—95.1)**

1. In a broach, a plurality of identical cutting units, holding bars transversely slotted to receive said cutting units, a supporting bar for said units having alternate raised and depressed top surface portions which support alternate cutting units of identical cross section in correspondingly raised and depressed relative positions, the top surface of the supporting bar being downwardly and backwardly inclined away from the cutting edges of said

cutting units, and each cutting unit having a cooling inclined bottom edge surface, and means to firmly seat



each cutting unit on the downwardly and backwardly inclined top surface of said supporting bar.

---

2,770,023
BROACH WITH MULTIPLE SMALL CUTTING UNITS

Oliver W. Bennafe, Hudson, Mass., assignor to The Lapointe Machine Tool Company, Hudson, Mass., a corporation of Maine

Application January 31, 1955, Serial No. 484,981
2 Claims. (Cl. 29—95.1)

2. In a broach, a broach body having front and back surfaces, a plurality of relatively small cutting units, a separate holder for each unit, longitudinally extended bars mounted at the front surface of said body and receiving said holders in two transversely spaced longitudinal series, with the cutting units gradually approaching the center line of the broach toward the first cutting units, means to adjust said bars transversely while preserving their original angular relation, tapered supporting members underlying said bars and having bar-engaging surfaces which gradually approach the back surface of the broach body toward the first cutting units, and means to adjust said members longitudinally to raise or lower said cutting units relative to the work but without change in the original angular relation of the series of units relative to the back surface of the broach body.

---

2,770,029
COMPOSITE ELECTRICAL RESISTOR

Herbert F. G. Ueltz, Worcester, Mass., assignor to Norton Company, Worcester, Mass., a corporation of Massachusetts

No Drawing. Application June 2, 1952,
Serial No. 291,327
1 Claim. (Cl. 29—182.2)

A dense integral electrical resistor having a porosity of less than 1%, and having a central portion consisting of 85% to 90% molybdenum, silicon and molybdenum disilicide, the remainder mainly nickel, said resistor having cold ends consisting of from 50% to 60% molybdenum, silicon and molybdenum disilicide, the remainder mainly nickel, the entire resistor having a composition consisting of the elements molybdenum, silicon and nickel to the extent of at least 96%, at least 80% of the total molybdenum and silicon being present as molybdenum disilicide, both the central portion and in the cold ends having at least 31% molybdenum, at least 18% silicon and at least 10% nickel, there being not more than 4% of elements other than said molybdenum, silicon and nickel in the central portion and in the cold ends, and of said elements other there being not more than 2% of the central portion and not more than 2% of the cold end elements of the iron group other than nickel, all percentages being by weight.

---

2,770,030
WELDED JOINT BETWEEN DISSIMILAR METALS

Otis R. Carpenter, Barberton, and Nicholas C. Jessen, Akron, Ohio, assignors to The Babcock & Wilcox Company, Rockleigh, N. J., a corporation of New Jersey

No Drawing. Application June 15, 1950,
Serial No. 168,385
3 Claims. (Cl. 29—196.1)

1. A welded joint for use under cyclically variable elevated temperatures and pressures, comprising a Cr—Ni austenitic alloy steel member, a low alloy ferritic steel member of the chromium containing type and having a carbon content in the range of 0.10% to 0.15%, and a weld deposit uniting said members and consisting of a ferritic alloy steel having substantially the same composition as said ferritic steel alloy member but containing carbon in an amount not exceeding 0.05%.

---

2,770,031
BEARING

Alfred W. Schlachter, Dearborn, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

No Drawing. Application April 16, 1953,
Serial No. 349,361
7 Claims. (Cl. 29—197)

7. A bearing formed of an alloy containing approximately 0.5% to 9% silicon, 0.2% to 5% cadmium, 0.03% to 0.5% indium, and the balance substantially all aluminum, the physical structure of said alloy being substantially free of continuous networks of brittle eutectic mixtures.

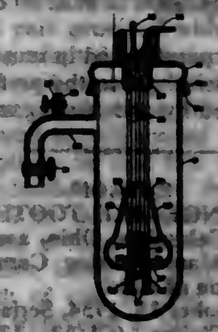
---

2,770,032
TOOL FOR INSERTING FLUTING

Gerard J. Kelly, Light Street, Pa., assignor to American Car and Foundry Company, New York, N. Y., a corporation of New Jersey

Application January 20, 1951, Serial No. 206,957
2 Claims. (Cl. 29—235)

1. A tool for inserting a resilient metallic snap-in type fluting having a top portion and depending side flanges terminating in lower edge surfaces into a prepared recess comprising, a base member having a grooved portion engageable with the top portion of the fluting, pairs of spaced-apart rollers mounted on said base member at opposite sides of said grooved portion for rotation about substantially parallel axes, said rollers each having a flat tread portion engageable with the side flanges of the fluting to compress the same toward each other and a rim portion projecting outwardly from the lower portion of the flat tread portion and engageable with the edge surface of the fluting side flanges to retain the fluting in the tool and to prevent side twist of the fluting during insertion in the prepared recess, guide means secured to said base member between a pair of said rollers engageable by said fluting to assist said rollers in preventing side twist of the fluting, and a handle for moving said tool along said fluting.

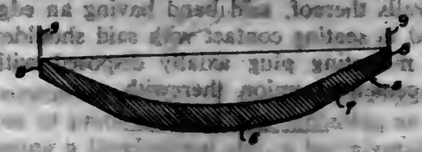


---

2,770,033
METHOD OF SOLDERING A THIN BERYLLIUM MEMBER TO A METAL PART

William A. Zarth, Stamford, Conn., assignor to Machlett Laboratories, Incorporated, Springdale, Conn., a corporation of Connecticut

Application June 14, 1951, Serial No. 231,467
2 Claims. (Cl. 29—488)



1. A method of soldering a thin piece of beryllium vacuum-tight to a support wherein the beryllium surface is cleaned, thereafter the beryllium surface is etched in a suitable etching solution, then transferred without rinsing and while still covered with the etching solution directly into a solder wettable metal plating solution and plated, a layer of hydride of a metal is applied atop the plated area, brazing solder is placed atop the hydride, the support is placed atop the solder, and, when thus assembled, the solder is melted in a vacuum furnace and caused to flow sufficiently to complete the vacuum-tight bond between the beryllium and its support.

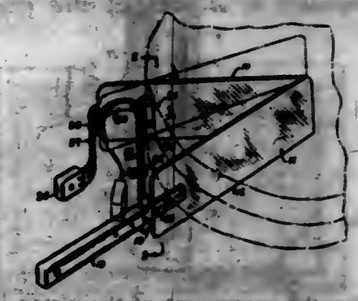
---

2,770,034
METHOD OF COINING AND CUTTING METAL

George Albert Lyon, Detroit, Mich.

Application March 14, 1952, Serial No. 276,576
1 Claim. (Cl. 29—534)

In a method of coining and cupping a metal blank, the steps of coining a metal blank to provide a blank of oversize diameter having a gradually diminishing thickness uniformly toward the peripheral margin of the blank from a thicker central portion, trimming the periphery of the blank to provide a smooth unbroken concentric circular peripheral edge with a uniform radially outwardly beveled surface extending from one side to the opposite side of the blank, and cupping the blank by simultaneously forcing the portion of the blank radially outwardly of said central portion into cylindrical form from said opposite side and depressing the central portion of the blank on said one side to provide a cylindrical cup side wall of substantially uniform thickness.



---

2,770,035
CAKE CUTTER AND SERVER

Gerard J. O'Brien, Jersey City, N. J.

Application February 29, 1956, Serial No. 568,555
3 Claims. (Cl. 30—114)

1. A cake cutter and server comprising a pair of blades adapted to cut down through a cake, each of said blades having a handle at one end thereof, a telescopic member having one end rigidly secured to one of the blades at the handle end thereof and extending at an angle thereto in the direction of the other of said blades, the other end of said telescopic member being pivotally secured to said other of said blades near the handle end thereof, resilient

means normally urging said other of said blades to swing toward said one of said blades to a limit position wherein the other ends of the blades are in mutual contact, and means for locking said telescopic member against expansion or contraction.

---

2,770,036
SAWING APPARATUS, AND MORE PARTICULARLY A PRUNING SAW

Albert E. Anderson, Greenwich, Conn., assignor, by mesne assignments, to Textron Inc., a corporation of Rhode Island

Application June 23, 1955, Serial No. 517,563
17 Claims. (Cl. 30—167)

1. In a pruning saw adapted for cutting limbs from below, a saw head comprising a rotatable angular rim-driven saw blade having teeth on its periphery, means for supporting the saw blade for rotation about its axis and for driving the saw blade, means at the top of the saw head forming with the saw blade a limb-receiving and cutting zone, and a kerf retainer aligned with the saw blade at the cutting zone for engagement with the limb on opposite sides of the kerf formed therein by the saw blade.

---

2,770,037
DEVICES FOR SURGICAL WORK

Gustaf Erik Björklund, Stockholm, and Svante Roland Edvardsson, Solna, Sweden, assignors to Aktiebolaget Dunstong, Hagersten, Sweden, a corporation of Sweden

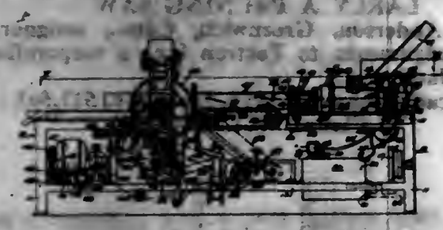
Application June 25, 1954, Serial No. 439,304
Claims priority, application Sweden June 30, 1953
7 Claims. (Cl. 30—372)

1. A hand tool for surgical work comprising a casing having a bore, a cylinder movable axially in said bore, said cylinder including connecting means for connection of a pressure fluid conduit, a hydraulic pressure operated piston movable axially to and fro in said cylinder and carrying a working tool intended to penetrate into material worked upon as the piston moves in one direction,

and an upper clamping tool actuated by said cylinder intended to hold the material as the working tool is with-

drawn during the movement of the piston in the opposite direction.

---



2,770,038

**AUTOMATIC FEED SYNCHRONIZING MECHANISM FOR SUBSTANCES PREPARATORY TO PROCESSING**

Bertil J. Skoglund, Elmwood Park, Ill., assignor to Charles Doering and Henry Doering, Chicago, Ill.

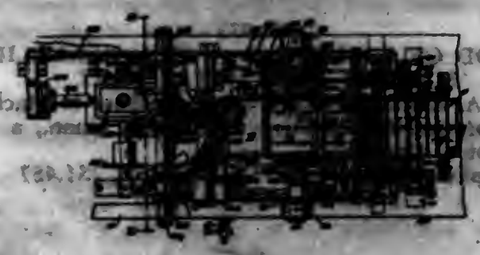
Application May 12, 1952, Serial No. 288,971

20 Claims. (Cl. 31—9)

1. In a plasticizing and preforming device of the character mentioned, the combination with means for displacing irregular masses of plastic substances at a substantially uniform rate along a predetermined path, means associated with said displacing means for extrusion of the irregular masses of plastic substances into elongated columns of preformed substances, means in said path for converting said preformed substances into uniform preformed increments, conveyor means between said extrusion and increment converting means to present said elongated uniform column of substances to said converting means responsive to the latter uniform rate of displacement, and means reacting to said substance preforming means to synchronize the operation of said displacing and increment converting means in a continuity of coordinated operations of said preforming, feeding and increment converting means.

---

2,770,039



**CONTINUOUS FEEDING AND SLICING MECHANISM FOR PLASTIC SUBSTANCES AND THE LIKE**

Charles Doering and Henry H. Doering, Chicago, and Bertil J. Skoglund, Elmwood Park, Ill.; said Skoglund assignor to said Charles Doering and said Henry H. Doering

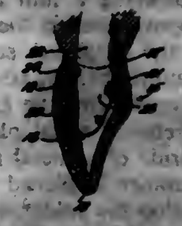
Application December 17, 1951, Serial No. 262,146

10 Claims. (Cl. 31—20)

1. In a cutting mechanism of the character mentioned for cutting uniform thin slices from preformed slabs of material, the combination with a rigid frame, of means on said rigid frame for feeding preformed substances along a predetermined path, a cutter frame mounted proximate to the end of travel of said feeding means in said path for movement in timed relation with said feeding means, cutter means mounted for reciprocable movement in said cutter frame substantially transversely of said feeding means, and means on said rigid frame for continuously operating said feeding and reciprocable cutter means in timed relation to displace said cutting

means along a path parallel and in unison with said feeding means to successively slice the preformed substances while being displaced by said feeding means.

---



2,770,040

**INTERCHANGEABLE TOOTH CROWN**

James H. Meyer, Columbus, Ohio, assignor to The Columbus Dental Manufacturing Company, Columbus, Ohio, a corporation of Ohio

Application October 14, 1954, Serial No. 462,225

5 Claims. (Cl. 32—12)

1. Jacket crown construction for dental bridges, comprising: a molded heat-hardened body, said body including an internal cavity closed on all sides thereof and terminating in a cervical extension which opens to the gingival end of the body, said cavity being formed with an inwardly and laterally projecting shoulder placed in predetermined spaced relationship to the open end of said extension; a metallic mounting band positioned in said extension for close-fitting cemented engagement with the walls thereof, said band having an edge thereof arranged in seating contact with said shoulder; and a stationary mounting plug axially disposed within said band for cemented union therewith.

---

2,770,041

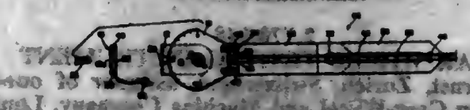
**SIGHT FOR FIREARMS**

Herman M. Bell, Beaverton, Oreg.

Application April 6, 1954, Serial No. 421,404

5 Claims. (Cl. 33—56)

3. In an open field sight for fire arms, the combination of a sight hole concentrically located within a ring, arms projecting radially from the center of said ring, an elevation eccentric supporting said arms, and an azimuth eccentric encircling said elevation eccentric, said azimuth and elevation eccentrics being out of phase with respect to each other, a sight mounting embracing said azimuth eccentric and secured to the barrel of a fire arm, said mounting being displaced from a vertical centerline passing through the bore of the barrel and the center of said hole by an amount substantially equal to one half the eccentricity of said elevation eccentric.



2,770,042

**POINT LOCATING DEVICE**

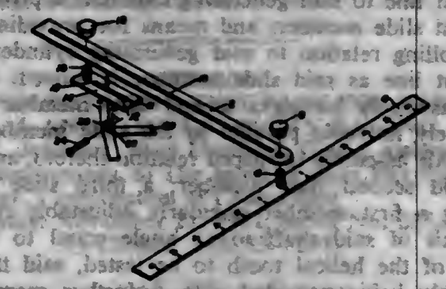
Robert R. Hume, Greenwich, Conn.

Application April 15, 1952, Serial No. 282,415

3 Claims. (Cl. 33—75)

1. The combination of a device for locating points from a known point with a measuring tape comprising a support adapted to be fixed at said known point, a locator comprising a first part provided with an index thereon, said first part being adapted to be removably held in said support, a second part pivoting on said first part, said second part having graduations thereon, an extension arm pivotally secured to said second part whereby when said second part pivots on said first part said index coacts with said graduations to give the direction of said point to be located by said measuring tape, said extension arm comprising at least two sections, one extensible section being slidable along the longitudinal axis of the other section, both of said sections being pivoted as a unit in a direction transverse to the pivotal movement of said second part, and guiding means on one of said sections for preventing said measuring tape from deviating from said direction of said point to be located.

---



2,770,043

**TILER'S GAUGE**

Henry R. Kwiecinski, Brooklyn, N. Y.

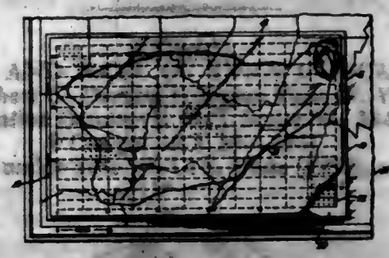
Application June 19, 1951, Serial No. 232,389

11 Claims. (Cl. 33—94)

2. A measuring device for gauging rectangular tiles to fit an area of predetermined size including an elongated shank having a longitudinal slot, a bar pivotally secured to one end of said shank, a support slidably mounted in the elongated slot for longitudinal movement along said shank, means to arrest said bar in its movement around its pivot relative to said shank, other means to arrest the movement of said support along said shank, a square slidably mounted in said support for movement parallel to the axis of said shank, means to limit the motion of and square in said support a distance exactly equivalent to the longitudinal distance between the outer and inner aspects of said square whereby the outer aspects of said square may be used in measuring the space to be filled and the inner aspects may be used to gauge a tile to be fitted to said space.

---

2,770,044



**DEVICE AND METHOD FOR MEASURING SURFACE AREAS**

Walter F. Wood, Iowa City, Iowa, assignor to The State of Iowa, for the use and benefit of the State University of Iowa, an educational institution of the State of Iowa, Iowa City, Iowa

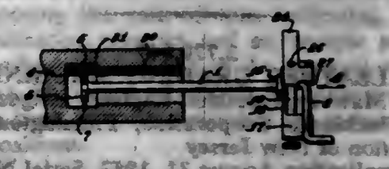
Application March 18, 1953, Serial No. 343,123

10 Claims. (Cl. 33—121)

1. A device for measuring a surface area, said device comprising a first sheet having a surface and a plurality of uniformly spaced apart dots located on said surface, each dot having a minimum size consistent with ability to count the dots easily, the area of said surface throughout which said dots extend being at least coextensive with the area to be measured whereby said first sheet may be placed in registry with the area to be measured and all

of the dots located throughout the area to be measured counted, the area of said surface actually covered by said dots being small in relation to the total area of said surface throughout which said dots extend but said dots being visible in relation to the area to be measured, and a second transparent sheet overlying said first sheet.

---



2,770,045

**STEM CALIPER**

Felix Oliva, Maywood, Calif.

Application November 25, 1955, Serial No. 549,076

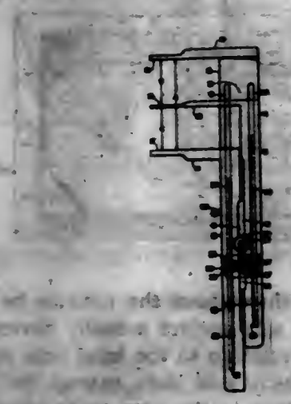
5 Claims. (Cl. 33—143)

1. A gauge of the character disclosed, including a pair of elongated telescopic members, the outer ends of which are provided with laterally projecting work-engaging arms lying in the same plane, one member of said pair provided with a crank arm, a disk secured to the other member of said pair and positioned transverse of said member, a swing block rotatably carried on one member of said elongated pair of members and adapted to lie in the path of movement of the crank arm to limit rotative movement thereof, and a braking means for said swing block releasably engaging the periphery of said disk, said crank arm when rotated in one direction, causing approach of the laterally projecting work-engaging arms and when moved in a second direction, causing separation between said arms, the said swing block limiting said separation.

---

2,770,046

**MEASURING INSTRUMENT**

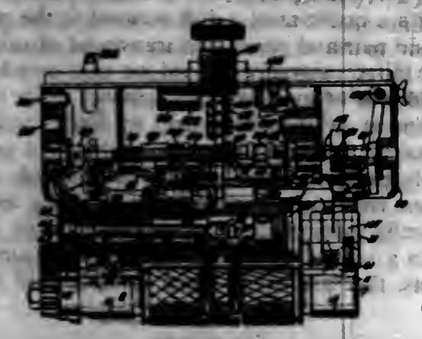


Wilhelm Wichmann, Clifton, N. J.

Application March 4, 1955, Serial No. 492,864

1 Claim. (Cl. 33—143)

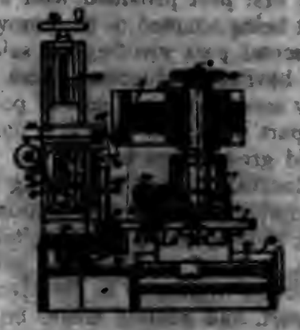
In a caliper device, a transverse stationary measuring jaw, a longitudinal supporting bar connected thereto, a second transverse movable jaw in cooperative relation to said stationary jaw, a longitudinal plate supporting said movable jaw and in slidable engagement with said bar, a transverse movable divider member disposed intermediate said jaws, a second longitudinal plate supporting said divider member and in slidable engagement with said bar, said plates being parallel to each other and disposed on opposite lateral sides of one surface of said bar, said plates having recessed portions along adjacent edges thereof in facing relation, whereby an elongated aperture is formed therebetween, a post affixed to said



bar and extending up through said aperture, a nut in threaded engagement with the outer end of said post and proportioned for pressing engagement with said two plates, whereby said plates are releasably held locked against movement, said bar having two longitudinal parallel grooves therein, each of said plates having a longitudinal gear rack extending into one of said grooves,

rotatable gear means on said bar and in operative engagement with one of said racks, other rotatable gear means on said bar and in operative engagement with the other of said racks, both of said rotatable gear means being in operative engagement with each other, whereby the operative movement of said movable jaw and its plate will cause an operative movement of said second plate and a corresponding movement of the divider member.

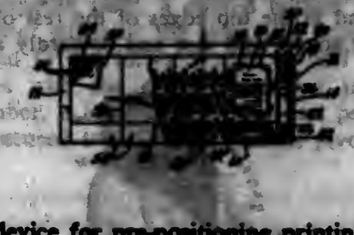
---



2,770,047
**LEATHER GRADING MACHINE**
Lawrence Mawbey, Leicester, England, assignor to United Shoe Machinery Corporation, Flemington, N. J., a corporation of New Jersey
Original application August 31, 1953, Serial No. 377,550, now Patent No. 2,720,101, dated October 11, 1955. Divided and this application February 15, 1955, Serial No. 488,369
7 Claims. (Cl. 33—147)

1. In a machine of the class described, measuring means comprising opposed members between which passes a work piece the thickness of which is to be measured, one of said members having a recess formed therein, means for registering the minimum thickness measurement of the work piece comprising a member movable to and fro in accordance with variations in the thickness of the work piece detected by said measuring means, a stop cooperating with said registering member to prevent its movement in response to increasing thickness of the work piece, a latch for normally holding said stop out of engagement with said registering member, connections for releasing said latch to free said stop for movement into cooperative relation with said registering member whereby its minimum thickness measurement registering action is started, said connections comprising a work-engaging shoe mounted for movement in said recess in response to engagement therewith of the work piece upon its emergence from said measuring means, and means acting upon said stop between successive measuring operations to reset said latch.

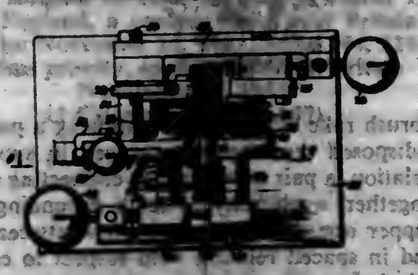
---



2,770,048
**GEAR WHEEL TESTING INSTRUMENT**
Daniel Ernst, Zurich, Switzerland, assignor of one-half to Maag Gear-Wheel and Machine Company, Limited, Zurich, Switzerland, a body corporate of Switzerland
Application October 1, 1953, Serial No. 383,624
6 Claims. (Cl. 33—179.5)

1. An instrument for testing both the helical profile and involute face of a helical gear wheel having teeth of involute form, comprising a feeler adapted to contact the face of the tooth to be tested, a turnable shaft adapted to carry the gear wheel to be tested and a generating cylinder mounted on said shaft; a first slide assembly operatively connected with said generating cylinder and having a straight slide member movable parallel to a tangent line to said generating cylinder, a pivot on said straight slide member, and means for providing a relative rolling relation to said generating cylinder on said tangent line as said slide member is moved; a second slide assembly having a second slide member which is relatively movable parallel to the slide member of the first slide assembly in spaced relation thereto, and a pivot on said second slide member; a third slide assembly having a first member angularly adjustable relative to the axis of said shaft to an angle equal to the helix angle of the helical tooth to be tested, said third slide assembly being provided with a further member, said further member and said second slide member of said second slide assembly being provided with slider means interconnecting said third assembly with said second assembly, said third assembly being provided with another member which is operatively connected with said feeler; indicator means operatively connected and cooperating with said feeler for indicating any departure from the true contour of the tooth being tested; means for providing relative movement between said third slide assembly and said shaft to bring the point of said feeler in contact with the flank of the tooth to be tested; a pivoted lever of variable effective length mounted on a main pivot disposed in fixed parallel relation to said shaft and on the pivots of the first and second slide members and slidably pivoted on at least two of said pivots to provide an operative connection between said slide members and shaft, whereby the ratio of the arms of said lever when the point of the feeler is located on the base circle is always in the ratio of the radii of the generating cylinder and base circle respectively; means for providing movement of said feeler and of said third slide assembly in a plane parallel to the axis of said shaft and cooperating with said slider means whereby the point of said feeler is moved along a helical tooth contour of the tooth to be tested; and means for moving said third slide assembly parallel to said tangent line to said generating cylinder whereby the point of said feeler is moved along an involute contour of the tooth to be tested.

2,770,049
**APPARATUS FOR PRE-POSITIONING PRINTING PLATES**
Harry R. Wiesenbacher, Lawrence, N. Y.
Application January 28, 1954, Serial No. 406,549
10 Claims. (Cl. 33—184.5)



1. In a device for pre-positioning printing plates on a bed, a straight-edge assembly mountable on one side of an imposing table, and comprising a backing plate attachable to said table, an aligning bar extending the length of said backing plate and projecting forwardly therefrom, a guide lip extending the length of said aligning bar, and clamp means carried by said bar and adapted to cooperate with the lip in engaging therebetween an aligning sheet overlying said bed, the bar having a top surface offset upwardly from the top surface of the lip, to define a vertical abutment extending along one edge of the lip against which said sheet may be positioned.

7. In an aligning device for pre-positioning printing plates on a bed having diagonally extending grooves with clamping hooks adjustably mounted in the grooves, a transparent mask adapted to provide a support for individual page proofs with which the plates are to be registered, said mask having perforations parallel to the diagonal grooves through which a key pin may be extended for registering the plates with said proofs, the perforations being formed in the shape of slots.

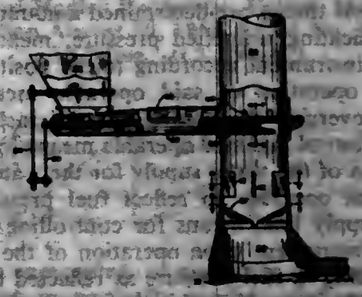
2,770,050
**GAGE FOR ROTATING TEST PART FOR PERIPHERAL AND CONCENTRICITY GAGING**
Stanley G. Johnson, West Hartford, Conn., assignor, by mesne assignments, to The Johnson Gage Development Company, a corporation of Connecticut
Application November 21, 1951, Serial No. 257,589
14 Claims. (Cl. 33—199)

7. A gage for gaging a test part having axially adjacent threaded portions comprising a gage frame, gaging means including a pair of thread gaging rollers, pivot means mounting the gaging rollers upon the frame for rotation and in parallel spaced relation to engage a test part at spaced points around the periphery thereof, cooperating gaging means including at least one thread gaging roller, pivot means carried by the gage frame to rotatably mount the gaging roller of the cooperating gaging means thereon in parallel spaced relation to the pair of gaging rollers, means mounting at least one of the gaging means for movement towards and away from the other gaging means to insert a test part within the gaging means and to gage the test part, means to rotate one of the gaging rollers for rotating the test part, an indicator connected with the gaging means having a gaging movement to indicate the position thereof and gage the test part, a fourth thread gaging roller, pivot means mounting the fourth gaging roller for rotation and for axial movement, mounting means mounting the pivot means for the fourth gaging roller for movement towards and away from the gaging axis and the adjacent thread of the test part, and an indicator carried by the gage frame and engaging the mounting means to indicate the position thereof and of the fourth gaging roller.

---

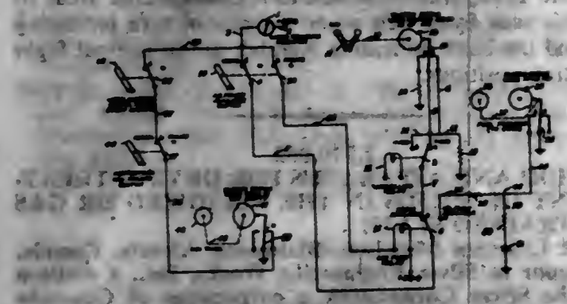


2,770,051
**BANK AND RATE OF TURN INDICATOR**
Robert G. Drever, Williston Park, N. Y.
Application October 5, 1953, Serial No. 384,359
8 Claims. (Cl. 33—204)
(Granted under Title 35, U. S. Code (1952), sec. 266)

5. An indicator of the character described comprising a pivoted rate of turn indicating arm, a substantially semi-circular bank indicating member pivoted at its upper end to said arm and having at least two distinct and differently designated areas, a front face having a transparent portion for exposing the rate of turn indicating arm and the bank indicating member and an opaque portion of the same configuration as one of the designated areas to hide this area from view when the rate of turn indicating arm and the bank indicating member are in normal flight indicating positions.

---

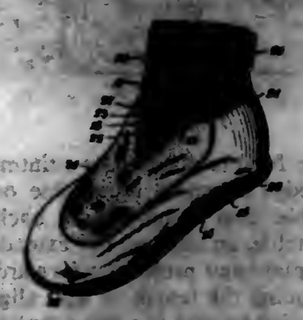
2,770,052
**METHOD AND APPARATUS FOR DRYING TREATMENT OF SOLIDS IN THE FLUIDIZED OR GAS ENTRAINED STATE**
Robert Laurance Morrison, Blairmore, Alberta, Canada, assignor to Silver Engineering Works, Inc., a division of the Silver Corporation, a corporation of Colorado
Application July 29, 1952, Serial No. 301,494
8 Claims. (Cl. 34—10)



6. The process of drying sub-divided coal or the like, which comprises directing heated gases upwardly through a closed vertical drying zone, feeding such coal in sub-divided condition into said drying zone intermediate its ends, subjecting the heated gases to a swirling action at the lower end of said drying zone and below the level of feed introduction, subjecting the swirling gases to a swirl-retarding action at a point below the level of feed introduction to the drying zone whereby the coal is suspended in the non-swirling gas, and separating the dried coal from heated gases after its passage from said drying zone.

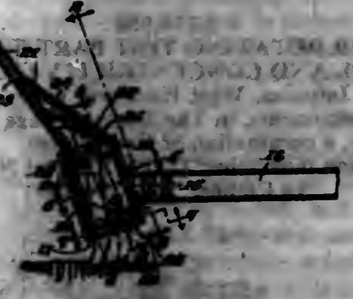
2,770,683
METHOD FOR PRODUCING PELLICLES, FILMS, AND SHEETS
Charles M. Ramer, Wallingford, Pa., and William Oldham Brilhart, Fredericksburg, Va., assignors to American Viscose Corporation, Philadelphia, Pa., a corporation of Delaware
Original application June 5, 1952, Serial No. 291,956. Divided and this application July 13, 1956, Serial No. 597,681
4 Claims. (Cl. 34—12)

1. A process for drying pellicles which comprises the steps of positioning a plurality of wet gel pellicles in face-to-face contact, passing said contacting pellicles into a drying stage, separating said pellicles during said drying stage before the moisture content thereof has been reduced to 30% by weight, treating the opposed surfaces of said pellicle during such separation with an aqueous liquid medium, restoring said pellicles into face-to-face contact and continuing passage of the same through said drying stage, separating said pellicles after the moisture content thereof is less than 30% by weight, and completing the drying thereof.



2,770,654
SIMULATED WATER INJECTION SYSTEM
Robert G. Stern, West Caldwell, and Duncan W. Simpson, Wyckoff, N. J., assignors to Curtiss-Wright Corporation, a corporation of Delaware
Application November 24, 1954, Serial No. 470,916
10 Claims. (Cl. 35—12)

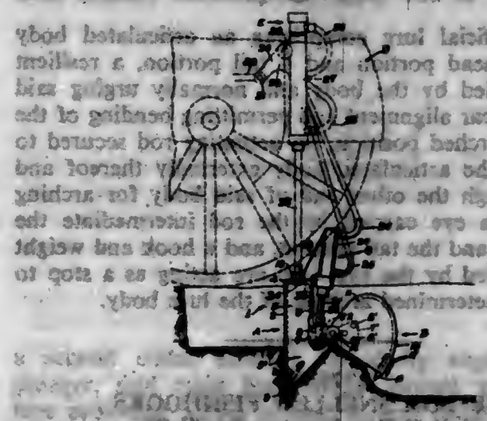
1. In ground based training apparatus for aircraft personnel, means for simulating the operation of a water injection system comprising a simulated air-fuel mixture control, means operable for reflecting a simulated engine R. P. M. of less than a pre-determined amount, an instrument for indicating simualted pressure, means for controlling said instrument according to the position of said control and operation of said operable means, means operable to override the control of said instrument by the mixture control and said operable means for reflecting the exhaustion of the water supply for the water injection system, means operable to reflect fuel pressure in the carburetor supply line, means for controlling the operation of said instrument upon operation of the overriding means according to fuel pressure as reflected by the last-named operable means including timing means for gradual control of said instrument upon operation of the overriding means with the fuel pressure reflecting means operated to reflect less than a pre-determined pressure.



2,770,655
SLIPPER
Helen M. Hayden, New York, N. Y.
Application January 22, 1954, Serial No. 405,590
1 Claim. (Cl. 36—51)

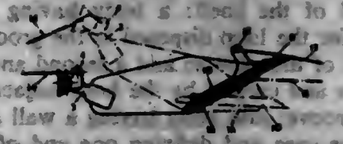
In a slipper that grips the foot of a wearer, the combination of a substantially inelastic sole, a substantially inelastic body attached to the sole and extending upwardly along the side of the foot to just below the ankle bone when the slipper is in use, said body having a slot of substantial width at its upper end extending downwardly for a short distance at the instep part thereof, and a sock portion fastened to said body at the edges of said slot and at the top edges of the rest of the body and extending across said slot and upwardly around the

ankle, the sock portion being made of stretchable material with the part of the sock portion that extends across the slot being less stretchable than the rest of said material and tighter against the wearer when the slipper is in use, whereby the part of the sock portion that extends across the slot creates a binding over the instep and against the heel and against the lower part to the leg of the wearer to hold said slipper in position against removal by scuffing or kicking.



2,770,656
BRUSH RAKE ATTACHMENT FOR A TRACTOR
Elmer W. Hawkins, Jonesboro, Ark.
Application August 9, 1955, Serial No. 527,352
2 Claims. (Cl. 37—3)

1. A brush rake attachment comprising a pair of horizontally-disposed cross-beams arranged in superimposed spaced relation, a pair of end plates connecting said cross-beams together, a plurality of teeth dependingly carried by the upper one of said cross-beams between said end plates and in spaced relation with respect to each other, said teeth being connected to said upper one of said cross-beams for swinging movement transversely with respect to said pair of cross-beams between a forwardly position and a rearwardly position, said teeth projecting by their lower ends below the lower one of said cross-beams, and spring means connected to said teeth adjacent their lower ends for biasing said teeth toward the forwardly position.



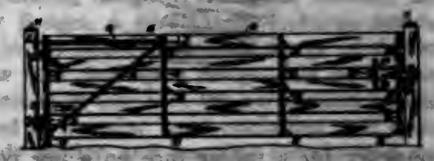
2,770,657
GRAVE DIGGER
John L. Camp, Waverly, N. Y.
Application July 31, 1953, Serial No. 371,444
3 Claims. (Cl. 37—169)

1. Grave excavating equipment comprising an elevated support, a hydraulic motor mounted on said support and having a piston rod actuated thereby, a shovel member rigidly secured to said piston rod, said shovel member having an elongated front plate and a foreshortened back plate, an upper end wall and a pair of parallel side plates integral with the front and back plates and retaining said front and back plates in spaced parallel relation to each other, and ground engaging teeth secured to the lower edge of said front wall, a scoop member having a pair of opposed sides, a curved bottom wall integral with the lower edges of the sides and ground engaging teeth secured to the forward edge of said bottom wall for coaction with the ground engaging teeth on said shovel member, a crankshaft having end portions thereof rigidly secured to said sides, means pivotally mount-

ing opposed ends of said crankshaft on said shovel member, a hydraulic motor rigidly secured to said shovel member and having a piston rod actuated thereby, means connecting said piston rod with said crankshaft whereby actuation of said second hydraulic motor effects rotation of said scoop member toward and away from said shovel member, and actuation of said first hydraulic motor raises and lowers said shovel member together with the elements associated therewith in vertical relation to ground level so that in excavating position said shovel and scoop members are located below ground level.

2,770,658
SCRAPER BUCKETS
James Stewart Thompson, Bildworth, near Mansfield, England, assignor to Coal Industry (Patents) Limited, London, England, a company of Great Britain
Application November 14, 1952, Serial No. 320,429
Claims priority, application Great Britain November 16, 1951
11 Claims. (Cl. 37—147)

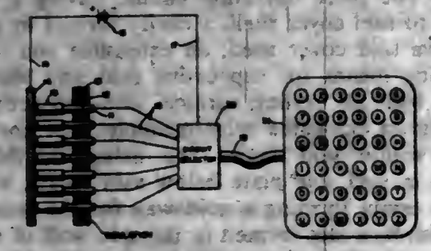
1. A scraper bucket comprising two opposite longitudinal side walls which have lower straight edges with portions upswept in straight lines towards the rear end thereby forming a fulcrum about which the bucket can rock between two limit positions of stable equilibrium in each of which limit position straight portions of said lower edges rest on the ground, a scoop member located towards the rear end of said side walls and extending therebetween and upwardly and rearwardly, a member having a portion curved outwardly frontwards and connecting together the said longitudinal side walls at their front ends, a front rope attachment means on said member, a forwardly facing ram on said member, and a rear rope attachment means at the rear end of said walls, the arrangement being such that a forward pull on said front rope attachment means rocks the bucket into one limit position and a rearward pull on said rear rope attachment means rocks the bucket about said fulcrum to the other limit position.



2,770,659
SELF-LIFTING SADIRONS
George A. Bruce, Highland Park, Ill., assignor to The Hoover Company, North Canton, Ohio, a corporation of Ohio
Application August 5, 1953, Serial No. 372,510
6 Claims. (Cl. 38—79)

1. A self-lifting smoothing iron comprising, a sole plate, a cover shell overlying and secured to said sole plate, a one piece operating handle having a front leg secured to said cover shell, a cavity formed in said front leg above said cover shell, an extensible and retractible supporting means for supporting said sole plate out of contact with an ironing surface, said supporting means including an elongated reciprocatable strut normally retracted within said cavity and extensible through an opening in said sole plate below said cavity, said opening and cavity forming a guideway for the reciprocation of said strut, a slot formed in the side wall of said front leg and extending from the exterior thereof into said cavity, and a control for said supporting means extending through said slot and being accessible for manipulation on the exterior of said front leg, said supporting means including a U-shaped spring actuator for said strut, one end of said spring being pivotally attached to said strut intermediate the ends thereof, the other end of said spring being connected to said control, the arrangement being such that movement of said control to one end of said slot moves said spring through a neutral position to one stable position in which said strut is retracted within said cavity with its lower end above the ironing surface of said sole plate and movement of said control to the other end of said slot moves said spring through its neutral position to another stable position wherein said strut is extended with its lower end positioned below the lower face of said sole plate whereby said sole plate is supported above an ironing surface.

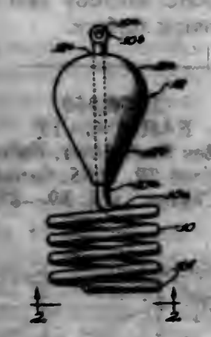
2,770,660
FARM GATE
Carl Hadley Remschler, Fulton, Mo.
Application August 29, 1955, Serial No. 531,241
3 Claims. (Cl. 39—87)



1. A gate comprising an assembly of horizontal gate bars arranged in vertically spaced relation, a pair of spaced, opposite tie members disposed on opposite sides near one end of said gate bar assembly, said tie members being V-shaped in cross section having lateral edge portions and central corner portions, said tie members being arranged with the lateral edge portions engaging the gate bars and with the central corner portions spaced outwardly from the gate bars, fastening means extending transversely through said corner portions of said tie members and through the intervening portion of each gate bar, horizontally disposed hinge elements extending between said tie members, adapted for vertical adjustment between pairs of spaced adjacent gate bars,

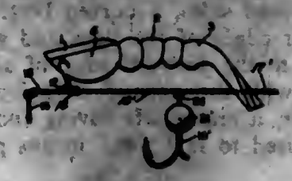
said hinge elements being provided with threads, a pair of clamp plates on each said hinge element, each pair of clamp plates engaging opposite sides of said tie members, adjustable threaded members threadedly received on said hinge elements, said adjustable members being disposed adjacent said pair of clamp plates and being adapted to vary the position of said clamp plates along said hinge elements, whereby to adjust the angular position of said gate.

---



**2,770,861**
**DISPLAY APPARATUS**
Henry T. Marcy, Vestal, N. Y., assignor to International Business Machines Corporation, New York, N. Y., a corporation of New York
Application December 30, 1955, Serial No. 556,558
5 Claims. (Cl. 40—52)

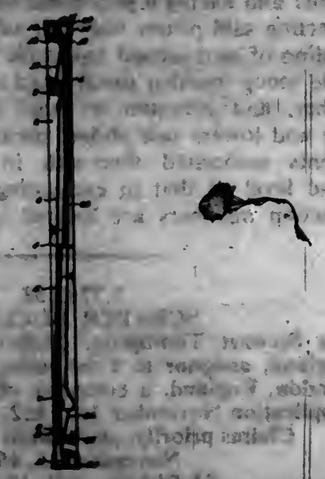
1. Apparatus for displaying information, comprising a conductive transparent sheet; a plurality of semi-conductive elements, said elements being positioned closely adjacent but spaced from one side of said sheet; means for applying a potential difference between the adjacent surfaces of selected ones of said elements and said sheet, whereby the selected elements are attracted to the sheet.



---

**2,770,862**
**WEIGHTED LURE RETRIEVER**
John A. Russell, Chicago, Ill.
Application January 20, 1956, Serial No. 560,415
4 Claims. (Cl. 43—17.2)

2. A retriever for a fishing lure on a line comprising in combination: a spring coil having an axis and being of a diameter sufficient to pass the lure and having an axial upstanding portion of substantial length having means at one end to receive a pull cord; a weight received on the upstanding portion of the coil and being spaced in relation to the turns of the coil to pass the lure, the largest dimension of the weight normal to the axis of the coil further being such that the line may pass vertically through the coil without interference with the weight, whereby the spring coil may be threaded through the line and lowered to engagement with the snagged lure, the retriever may be bounced on the lure to dislodge the same by repeated blows, and the lure may then be disengaged by passing the same through the coil.

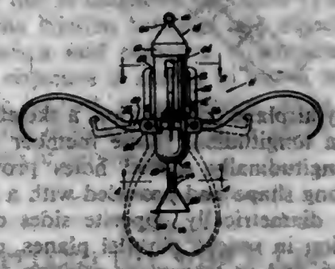


**2,770,863**
**ARTIFICIAL FISHING LURE**
William F. Martin, Amarillo, Tex.
Application June 29, 1951, Serial No. 234,349
2 Claims. (Cl. 43—42.32)

1. An artificial lure comprising an articulated body including a head portion and a tail portion, a resilient member carried by the body and normally urging said body into linear alignment and permitting bending of the body to an arched position, an actuating rod secured to one end of the articulated body externally thereof and passing through the other end of said body for arching said body, an eye carried by the rod intermediate the head portion and the tail portion, and a hook and weight member carried by the eye, said eye acting as a stop to permit a predetermined arching of the lure body.

---

**2,770,864**
**CASE FOR SNELLED FISHHOOKS**
Paul A. Kelley, Los Angeles, Calif.
Application June 25, 1954, Serial No. 438,784
5 Claims. (Cl. 43—57.5)



3. In a case for a hook having a snell with a loop at the free end of the snell: a body having a groove; a first anchor for the loop disposed in the groove and adjacent one end of the groove; and a second anchor exterior of the groove and carried by the body adjacent the other end of the groove; said body having a wall extending inwardly of the case and defining one end of the groove, said wall having an edge which defines a passage with the case from said end of the groove, to that portion of the case beyond the groove; said second anchor being carried by a wall adjacent said passage and in the case; said second anchor being adapted to anchor a rubber band extending through the passage for engaging the hook; the groove being deep enough to receive the snell and hook entirely within the groove; and the edge of the wall at the passage being so placed as to bias the snell toward the bottom of the groove.

---

**2,770,865**
**FISHING APPARATUS**
Willie James Walker, Phoenix City, Ala.
Application April 16, 1956, Serial No. 423,699
3 Claims. (Cl. 43—99)

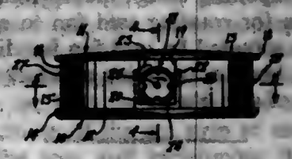
3. In a trap device, a tubular main body having a bottom wall, a plurality of pairs of hooks pivoted to opposite sides of said body in opposing relationship and being swingable toward each other, spring means biasing said hooks toward each other, a plunger mounted for axial sliding movement in said main body, the lower end of said plunger extending through said bottom wall and projecting axially from said body, a bait carrier secured to said lower end, respective hooked catch arms on said hooks, a first collar element on said plunger, an annular detent rib on said first collar element, said catch arms being engageable with said rib to hold the hooks spread apart, guide means on the top end of said main body slidably receiving the upper end of said plunger,

a second collar element threadedly engaged on the plunger, said main body being formed with an aperture providing access to said second collar element for adjustment of the same, and a coil spring surrounding said plunger and bearing between said second collar element and said bottom wall, biasing said plunger toward said catch arms, the rib being disengageable from said catch arms responsive to an outward axial pull on said bait carrier, whereby the hooks are swung toward each other by said spring means, said body being formed with apertures through which said catch arms are extensible to engage with said rib.

---

**2,770,866**
**INSECT TRAP**
Paul J. O'Sullivan, Pasadena, Calif.
Application September 8, 1953, Serial No. 378,841
1 Claim. (Cl. 43—107)

In an insect trap, a cover for attachment to a receptacle having a threaded neck defining a mouth, comprising: a strip of thin ribbon of thickness, width and material conforming to the thickness, width and material of photographic film, said ribbon being wound spirally upon itself to form an intermediate body of flat ring form, succeeding convolutions of said ribbon being displaced axially in the same direction both at the periphery and the center of said intermediate body so as to form a central annular lip of acute angular section tapering to a relatively thin edge consisting not over three convolutions, and a peripheral skirt which is likewise of acute angular section, terminating in a thin edge, and an insert ring formed of sheet metal including a face flange secured to the inner wall of said flat ring body and a flange with a rolled thread projecting axially from the periphery of said face flange in radially spaced relation to said skirt, for threaded connection to said neck.

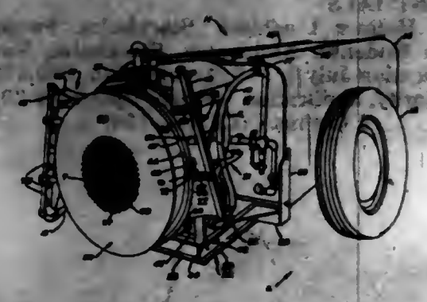


**2,770,867**
**PROCESS FOR THE PRODUCTION OF A BAIT FOR KILLING RODENTS, MOLES, AND NOXIOUS ANIMALS**
Karl Axel Helmer Lindblom, Stockholm, Sweden, assignor to Rederiaktiebolaget Atlantbolaget, Stockholm, Sweden
Application July 23, 1952, Serial No. 300,478
Claims priority, application Sweden September 29, 1951
2 Claims. (Cl. 43—124)

1. A process for the production of a poison bait for killing rodents, wild rabbits and moles, gnawing insects and other noxious animals with similar habits, which process comprises soaking whole kernels of dry Indian corn of storable dryness having a hard, glassy, cellular tissue with a portion at the sprout end comprised of a soft, porous, cellular tissue in an aqueous solution of a poison toxic to said noxious animals for not over two hours to cause the solution to be absorbed substantially entirely in the soft, porous portion only of the kernels, and then drying the kernels to storable dryness to leave the poison substantially in said soft portion only, whereby the hard, glassy tissue remains non-toxic.

---

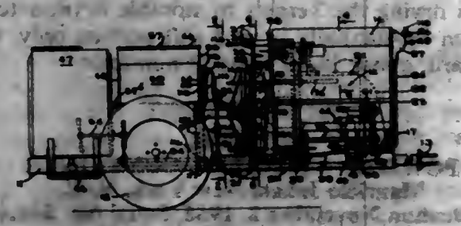
**2,770,868**
**POWDER ATOMIZER CONTAINER**
Mauricio Jakub, New York, N. Y.
Application November 2, 1955, Serial No. 544,422
11 Claims. (Cl. 43—146)



1. A box for dispensing powders, insecticides or the like comprising a cylindrical body section having a flexible bottom wall, an open top and spaced inner and outer flanges around the bottom wall, a cover section for the open top of said body section including a rigid top wall and a depending flange in the space between said inner and outer flanges, a perforated discharge nozzle device mounted in the upstanding inner flange of the body section below said depending flange, said outer flange having an opening in line with the perforation in said nozzle device, and an annular band encircling said outer flange of the body section and turnable therearound, said band having a hole therein adapted to be moved into register with the opening in the outer flange.

---

**2,770,869**
**AGRICULTURAL SPRAYING AND DUSTING APPARATUS**
Adrian St. J. Bowie, San Jose, Calif., assignor to Food Machinery and Chemical Corporation, San Jose, Calif., a corporation of Delaware
Application November 24, 1951, Serial No. 258,084
11 Claims. (Cl. 43—140)



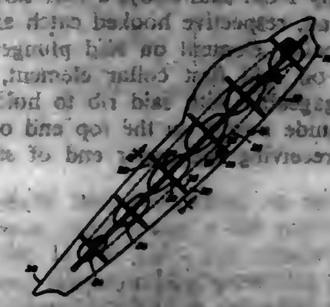
1. An agricultural pesticide spraying and dusting apparatus comprising a frame, means on said frame for creating an air blast, an air blast deflector enclosing said

air blast creating means and adjustably supported at one end only by said frame and disposed to receive and discharge said air blast in a predetermined direction, and means for delivering pesticide to said blast.

---

2,770,670
AGRICULTURAL PESTICIDE DISTRIBUTING APPARATUS
Walter W. Funk, Medina, N. Y., assignor to Food Machinery and Chemical Corporation, San Jose, Calif., a corporation of Delaware
Application December 24, 1952, Serial No. 327,874
11 Claims. (Cl. 43—149)

1. A pesticide distributing apparatus comprising a fan having an air impelling blade, means rotatably mounting said fan, means for rotating said fan to create a blast of air, and means actuated by said fan for discharging pesticide into said blast at a point substantially within the rotational path of said blade.



---

2,770,671
SOAP HOLDER AND SAVER
Fred J. Endres and Frank Paiva, Reno, Nev.
Application April 15, 1954, Serial No. 423,399
3 Claims. (Cl. 45—28)

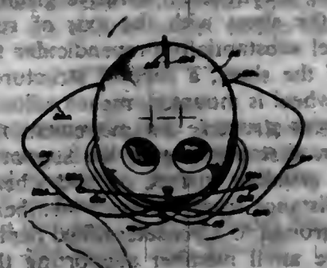
1. In combination, a bar of soap provided with a portion of reduced size, a cap arranged contiguous to the portion of reduced size, said cap including a continuous rolled edge embedded in said bar of soap and having its free end curved inwardly, a pair of fingers having curved sections extending from said cap and embedded in said bar of soap, a plurality of lugs projecting from the ends of said cap, a handle detachably connected to said cap and including a pair of body portions mounted for movement towards and away from each other, each of said body portions being provided with an opening, a flange extending transversely from each end of said handle, each of said flanges being provided with a plurality of sockets for receiving therein said lugs.

2,770,672
TOY AIRPLANE CONSTRUCTION
Nathan G. Rast, Rockford, Ill., assignor to Nils F. Teeter, Rockford, Ill.
Application February 27, 1952, Serial No. 273,631
4 Claims. (Cl. 46—17)

1. In a toy airplane construction, a skeleton framework comprising a longitudinal frame member having a plurality of longitudinally spaced holes provided therein, each of oblong shape and provided with a pair of shoulders on the diametrically opposite sides of the narrow middle portion in spaced parallel planes, cross-members assembled on and in transverse relation to the longitudinal member, one in each of said holes, each cross-member having one dimension intermediate its ends that is appreciably greater than the width of the narrow middle portion of the associated hole but less than the length dimension of said hole, said cross-member having on that dimension inwardly extending slots provided in diametrically opposite side portions thereof of a width approximately equal to the thickness of the longitudinal member and receiving the same to interlock the members when the cross-member is inserted in the associated hole to a position in which the slots are in coplanar relation to the longitudinal member and is turned to the interlocked position, the cross-member in its terminal assembled position having abutment on its opposite sides with the shoulders while the slots closely receive portions of the longitudinal member adjacent said shoulders outwardly from the hole, the distance between the inner ends of said inwardly extending slots on said cross-members being substantially equal to the width of the narrow middle portion of the holes associated therewith, and a longitudinal tie member entered in inwardly extending slots provided in said cross-members between the diametrically opposed slots, said tie member having longitudinally spaced substantially parallel slots provided in the inner longitudinal edge portion thereof closely receiving said cross-members at the slots therein to prevent turning of said cross-members from assembled position on the longitudinal member while holding the cross-members in fixed parallel relationship.

---

2,770,673
ANIMATED DISPLAY DEVICE
William J. Sullivan, Rossmoor, Mont.
Application June 21, 1954, Serial No. 437,974
2 Claims. (Cl. 46—239)



1. An animated display device including a support having a central vertical axis; a horizontally elongated objective; a substantially straight bar magnet carried by said objective and extending lengthwise thereof; first

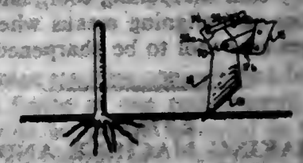
means, carried by said support, providing a substantially horizontal surface through which said axis passes, sustaining said objective for gliding movement in a substantially horizontal path with respect to said surface; a plurality of substantially straight bar magnets for attracting and repelling said bar magnet; and second means rotatably supporting said plurality of bar magnets spaced below said horizontal surface in spaced-apart relationship and arranged in a plurality of spaced-apart pairs, the bar magnets of one pair having their south poles remote from said axis and their north poles nearer said axis, and the bar magnets of another pair having their north poles remote from said axis and their south poles nearer said axis, whereby due to magnetic attraction of said bar magnets and to the friction between said objective and said first means when said objective is sustained upon said surface, said objective is caused to move, when said second means is rotated, in wandering paths around said axis without the objective tending to follow a cyclical or uniform pattern of movement.

---

2,770,674
SELF PROPELLED TOY WHICH CIRCUMVENTS OBSTRUCTIONS
David W. Jones, Glencoe, and Fred Zaut, Chicago, Ill.; said Zaut assignor to said Jones
Application September 3, 1953, Serial No. 378,326
10 Claims. (Cl. 46—247)

1. A self-propelled toy, comprising a housing, a pair of wheels supporting said housing, power means for driving said wheels, transmission means effective to drive said wheels simultaneously in either a forward or reverse direction, or to drive each of said wheels simultaneously in opposite directions with respect to each other, said transmission means normally effective to drive said wheels simultaneously so that said toy moves forward in a straight line direction, outwardly extending means extending outwardly of said housing and operatively connected with said transmission means, said outwardly extending means when engaged by an obstruction in the path of travel of said toy being effective to operate said transmission means so that said transmission means simultaneously drives said wheels in opposite directions with respect to each other to change the direction of travel of said toy whereby said toy may turn away from and avoid the obstruction.

---



2,770,675
ELECTRIC BAIT GETTER
Maurice B. Moore, Rushville, Ill.
Application July 26, 1955, Serial No. 524,469
1 Claim. (Cl. 47—1.3)

An electric bait getter comprising: a metallic electrode, a dielectric handle, a resilient dielectric grip encompassing said handle, said handle having a bore extending therein to support said electrode, a transverse bore extending through said handle, a nut seated in said transverse bore and engaged over said electrode securing said electrode in said first-named bore, said electrode bearing against said handle at its inner end to prevent inward movement of said electrode in said handle, an electric wire and means for connecting one end of said electric wire to said electrode including a bore in said electrode through which said wire extends, and a washer soldered to the free end of said wire.

---

2,770,676
METHODS OF REMOVING AND TRANSPLANTING TREES
Edward H. Klackbohn, Naperville, Ill.
Original application December 11, 1947, Serial No. 791,028, now Patent No. 2,652,639, dated September 22, 1953. Divided and this application January 8, 1953, Serial No. 330,285
4 Claims. (Cl. 47—58)

1. The method of removing a mature tree from the body of the earth utilizing an upstanding substantially U-shaped cutter having open front and rear faces; said method comprising submerging the upstanding cutter in the body of the earth at a first location disposed on one side of the tree and removed therefrom, advancing the submerged upstanding cutter in a substantially horizontal direction toward the tree and into a second location disposed directly below the tree in order to sever with the submerged upstanding cutter an elongated substantially horizontally disposed strip of earth substantially U-shaped in cross-section free from the body of the earth toward and only slightly past the mass of roots of the tree while leaving the cut strip of earth in place in the body of the earth and to sever with the submerged upstanding cutter the roots of the tree projecting beyond the confines of the submerged upstanding cutter, and then lifting the upstanding cutter from the body of the earth so as to raise therewith only the clump of the cut strip of earth disposed directly below the tree and enveloping the mass of the roots of the tree together with the tree and so as to leave undisturbed the raised clump of earth enveloping the mass of roots of the raised tree.

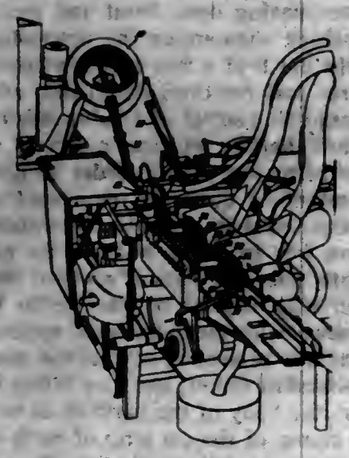
2,770,677
SOIL CONDITIONING WITH ALKENYL SUCCINIC COMPOUNDS
Keith L. Smith, Charleston, W. Va., assignor to Union Carbide and Carbon Corporation, a corporation of New York
No Drawing. Application October 14, 1954, Serial No. 462,367
9 Claims. (Cl. 47—58)

1. The method of improving the stability of granules of surface soils to the action of water which comprises incorporating in soil containing soil moisture from 0.005% to 1% based on said soil of one of the group consisting of alkenyl succinic acids and their anhydrides and salts, in which the alkenyl radical contains from five to eight carbon atoms.

---

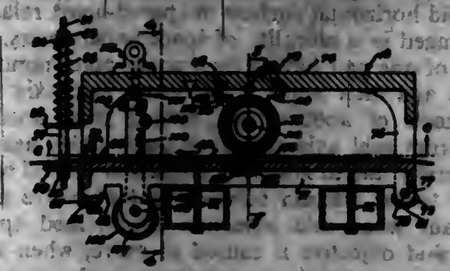
2,770,678
TOOL SHARPENER
Robert S. Rowden, Alhambra, Calif.
Application February 14, 1955, Serial No. 487,862
12 Claims. (Cl. 51—34)

1. A base adapted to be secured on a machine tool, an aligning means on said base, a tool shaft having sec-



end means cooperable with said aligning means for initially locating said base with respect to the axis of a tool chuck in which said tool shaft may be carried, third means for fixing said base on a machine tool employing said chuck, a carriage on said base and movable laterally with respect to the axis of said tool shaft, a tool post

supported by said carriage and movable thereby with respect to said tool shaft, and a sharpening tool on said tool shaft, said tool post disposed to support a tool to be sharpened by said sharpening tool, said second means disengaged from said aligning means when said sharpening tool engages said tool to be sharpened.



---

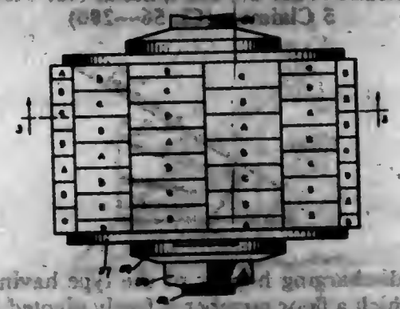
2,770,879
**BRUSH MAKING MACHINE AND METHOD**
John G. Baumgartner, Aurora, Ill.
Application July 14, 1954, Serial No. 443,360
15 Claims. (Cl. 51—74)

1. Apparatus for finishing the end portions of the bristles of a brush by grinding the same, which bristles are provided as a single compact tuft extending from the brush handle with the bristles being thin and individually yieldable over the length thereof, said apparatus including in combination, moving grinding means, brush handling means for retaining a brush in a position with the bristles thereof extending toward the grinding means, a bristle rest so constructed and so positioned relative to said brush handling means that a bristle tuft of a retained brush will engage said bristle rest on one side of said tuft intermediate the brush handle and the ends of the bristles, air supply means for directing a jet of air on the other side of the bristle tuft on said bristle rest to spread out the end portions of bristles and momentarily apply bristle-end-portions to the moving grinding means in a fanwise pattern so that a substantial number of the bristle-end-portions in the tuft are presented to the grinding means for grinding, said brush handling means operating to turn a brush retained thereby to present other bristles to the grinding means, and means in the apparatus cooperating with said brush handling means and said air supply means for interruptedly and repeatedly operating said two latter means to momentarily present in the fanwise pattern different parts of the bristle tuft to said moving grinding means for grinding bristle-end-portions into a tapered configuration.

2,770,880
**APPARATUS FOR COMBINING SHEETS OF PAPER**
Edwin R. Hoyt, Ashland, Ohio, assignor, by mesne assignments, to Beloit-Oliver Incorporated, Stamford, Conn., a corporation of Delaware
Application June 14, 1952, Serial No. 293,535
6 Claims. (Cl. 51—75)

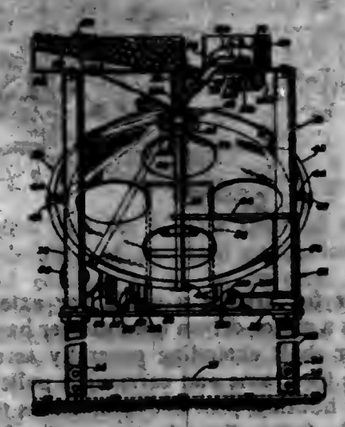
1. In apparatus of the character described, means for supporting a moving sheet of paper including a table and a rounded anvil member extending transversely of the path of movement of the sheet and over which the sheet is adapted to ride, means fixedly mounting the anvil member on the table with the anvil member projected to provide an arched path of movement of the sheet over the table with substantially a single point contact of the moving sheet with said anvil member and a substantially single point contact of the sheet at each side of the anvil member, a rotatable grinding wheel over the anvil member and having a cylindrical abrasive grining surface posioned over the sheet with the axis of rotation of the grinding wheel substantially prependicular to the path of movement of the sheet, a support structure upon which the grinding wheel is mounted, means adjustably supporting said support structure for movement relative to the anvil member, a stop engaging the support structure to maintain the grinding surface of said wheel a predetermined fixed distance from the anvil member whereby the sheet can be ground to a predetermined depth, at least the portion of the anvil member supporting the portion of the sheet engaged by the grinding wheel being of material substantially non-porous to paper dust, resilient means connected to said support structure to hold the same against said stop, and means including an exhaust nozzle adjacent said anvil to effect removal of ground dust.

---



2,770,881
**GRINDING APPARATUS**
Roy C. Northcutt and Joseph N. Skaggs, Muncie, Ind., assignors to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois
Application January 8, 1954, Serial No. 403,007
6 Claims. (Cl. 51—103)

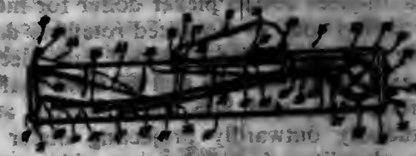
1. An apparatus for grinding simultaneously a plurality of diameters on a workpiece having a gear fixed thereon, comprising a multi-diameter grinding wheel positioned by support means a headstock and a tailstock for mounting the workpiece, a gear connected to the headstock and a countershaft, said countershaft being formed with a gear on one end in mesh with the gear on the headstock and a gear on the other end in mesh with the gear on the workpiece, whereby said gear on the headstock drives the gear on the workpiece thus rotating the workpiece at the same speed of rotation as that of the headstock and permitting simultaneous grinding of all of said diameters on the workpiece in a single operation.



2,770,882
**GRINDING AND POLISHING AND THE LIKE**
Harry Whitcomb, Chicago, Ill.
Application August 31, 1953, Serial No. 377,521
17 Claims. (Cl. 51—141)

1. A contact wheel having a peripheral cylindrical running surface for arcuate travel of an abrasive surface, said contact wheel including a body section and a plurality of elastic bodies lying in a cylindrical zone at the exterior radial portion of the wheel, each body being of substantially uniform degree of softness throughout its outer peripheral portion, said elastic bodies being of different degrees of softness and including a plurality of groups of bodies, the bodies of each group being of substantially the same preselected degree of softness, and the bodies of the different groups being of different degrees of softness and being located in said cylindrical zone, together with means to retain the elastic bodies within said zone.

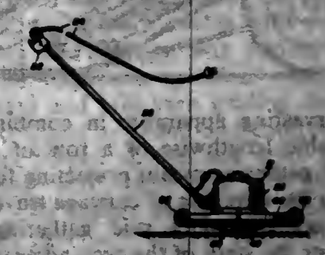
---



2,770,883
**TUBE HANDLING APPARATUS**
Elbe A. Wilcline, Baltimore, Md., assignor to Crown Cork & Seal Company, Inc., Baltimore, Md., a corporation of New York
Application October 28, 1953, Serial No. 388,749
30 Claims. (Cl. 53—76)

1. In an apparatus for inserting closures into containers, a container feeding device for successively feeding containers, a rotatable carrier member positioned below the container feeding device and having pockets therein positioned about its periphery for successively receiving containers in a horizontal position and transferring them to a vertical position upon 180° rotation of said carrier member, a closure feeding device positioned above said carrier member for feeding closures thereto, means on said carrier member for receiving and positioning said closures adjacent the end of said containers when the containers are in the horizontal position, means for inserting said closures into said containers after said closures have been positioned on said carrier member and while said containers are being moved from their horizontal position to their vertical position, and means for intermittently rotating said carrier member in step by step increments to position one of said pockets and said first-mentioned closure positioning means in communication with said container and closure feeding devices respectively whereby one of the containers is positioned horizontally in the pocket and one of the closures is positioned adjacent the ends of the horizontally positioned container.

---



2,770,884
**DEVICE FOR EXPANDING BAGS FOR FILLING**
Manuel L. Ruderman, New York, N. Y.
Application March 30, 1954, Serial No. 419,691
8 Claims. (Cl. 53—109)

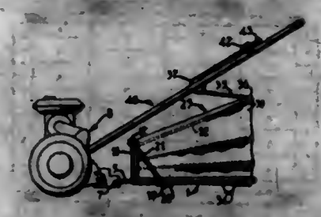
1. A bag package machine comprising a frame, a blower mounted in the frame at one end thereof, a bottom air guide and two side air guides mounted in the frame and extending from the blower, said bottom air guide having a bag edge holding free end portion, a bag holding table movably mounted in the frame and having one end disposed beneath said bag edge holding free end portion of the bottom air guide, a pair of spaced product guides mounted over the bottom air guide for closing movement together and opening movement apart, said product guides having front ends disposed adjacent to and behind said bag edge holding free end portion of the bottom air guide, and stop means adjacent said front ends of the product guides to limit the opening thereof, said table being pivotally connected at its other end to the frame and grounded, spaced contour blocks mounted on the table, a bag end holding member movably mounted on the table at the pivoted end thereof, said member having an upper end extending over the table, and a stiffy flexible bag holding shield adapted to rest on the table and on the spaced contour blocks thereon and removably held to the table by said bag end holding member.

---

2,770,885
**POWER MOWER WITH FRUSTO-SPHERICAL GROUND SHOE**
Myron P. Laughlin, St. Petersburg, Fla.
Application December 11, 1953, Serial No. 397,508
9 Claims. (Cl. 56—25.4)

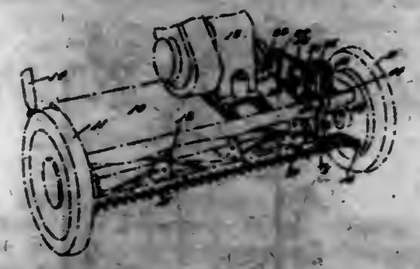
1. A power mower comprising a portable housing means, a power-rotated shaft depending from and extending substantially normal to said housing means, a generally frusto-spherical ground shoe operatively connected to the shaft below said housing means and forming a ground support for said housing means, a plurality of cutting means extending radially outwardly from the peripheral portion of said shoe, and handle means operatively connected to said housing means for tilting the latter and thereby the shoe to cause movement of the mower in a desired direction.

2,770,086
COTTON PICKER DOFFER
Harold M. Knuth, Davenport, Iowa, assignor to Deere & Company, Moline, Ill., a corporation of Illinois
Application March 15, 1954, Serial No. 416,016
17 Claims. (Cl. 56—41)



1. A multi-piece cotton picker doffer for mounting on and for rotation with an elongated rotatable doffer shaft, comprising: an externally threaded hub sleeve having opposite axially spaced ends and an axial shaft-receiving bore therethrough, said hub sleeve having at one end thereof radially outwardly projecting doffer mounting means; a plurality of radially separable sector-shaped plate-like doffer elements having doffing means thereon and contiguously grouped about the hub sleeve in a common plane normal to the axis of rotation to comprise a circular plate-like assembly having said axis as its center, each element having a center-proximate portion seating on the doffer mounting means, each center-proximate portion further having a sleeve-receiving notch therein; and annular, shaft-surrounding, internally threaded releasable means threadedly carried by the hub sleeve and movable axially relative to the hub sleeve toward the doffer mounting means and engaging the seated element portions for securing said elements in assembled relation to the hub and to each other.

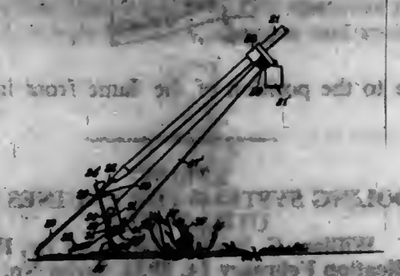
2,770,087
HARVESTING MACHINE FOR ROW CROP STALKS
Lloyd W. Hurlbut, Lincoln, Nebr., assignor to Research Corporation, New York, N. Y., a corporation of New York
Application November 23, 1954, Serial No. 470,717
6 Claims. (Cl. 56—46)



1. Seed harvesting apparatus in combination with a carriage movable lengthwise of a row of standing crop including stalk gathering means projecting forwardly from the carriage in the direction of carriage travel, stalk severing means associated with said gathering means and adapted to sever the stalk of the crop adjacent the ground, a pair of seed stripping rolls, said seed stripping rolls having their longitudinal axis extending generally upwardly and at an angle relative to said gathering means and the direction of carriage travel with the lower ends of said rolls positioned to receive the severed end of the stalk from the stalk severing means, power means for operating the gathering means, said severing means and for rotating the seed stripping rolls in opposite directions with the opposed surfaces of the rolls moving in a generally downwardly direction whereby the severed stalk will be discharged forwardly and to the side of the path of the incoming row of crop.

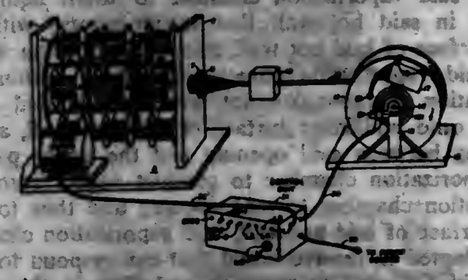
2,770,088
DUMPING HOPPER FOR LAWN MOWERS AND THE LIKE
Martin W. McNamara, Pittsfield, Mass., assignor of one-half to Martin W. McNamara, Jr., Chicago, Ill.
Application July 27, 1954, Serial No. 445,989
5 Claims. (Cl. 56—200)

1. In a discharging hopper of the type having a lower frame in which a floor member is freely pivoted for downward and rearward tilting movement when the frame member is raised and having means for pivotally connecting the forward end of the frame to the rear of a lawn mower and similar machines having a handle extending rearwardly over the hopper; upwardly extending lever arms secured to the sides of said frame and forming means by which the latter may be tilted upwardly about the pivotal connection of the frame to said machine, an upper frame connected to said lower frame by collapsible walls, said upper frame being connected at its forward end to the forward end of the lower frame for pivotal movement relative thereto to thereby permit the lower frame member to swing into close proximity to the upper frame member and collapse the flexible walls upon the application of forward tilting pressure on the lever arms.



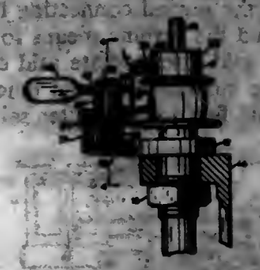
2,770,089
SICKLE BAR DRIVE ADAPTOR FOR ATTACHMENT TO REEL TYPE MOWER
Hugo F. Feuerlein, Philadelphia, Pa.
Application December 13, 1952, Serial No. 325,828
1 Claim. (Cl. 56—230)

An adapter for driving a sickle bar extending transversely across a motor-driven lawn mower having a frame, from a motor shaft extending generally across the lawn mower above the frame and carrying a pulley, consisting of an adapter housing, provided with means to removably and adjustably fasten the adapter on the frame, a first shaft journalled in the adapter housing and extending outside thereof at one end, pulley means on the first shaft outside the housing and adapted to connect with the lawn mower motor shaft pulley by means of a belt, gear means on the first shaft inside the housing, a second shaft in the housing journalled thereon and extending outside the housing and transversely to the first shaft, gear means in the housing on the second shaft cooperating with the gear means on the first shaft, an eccentric on the second shaft outside the housing, an eccentric strap pivot on the outside of the housing below the eccentric and an elongated eccentric strap extending below the frame, having an eccentric strap opening at one end surrounding and engaging the eccentric and having a fork at the opposite end adapted to engage the sickle bar, the eccentric strap being pivoted on the eccentric strap pivot between the two ends of the eccentric strap.



2,770,090
CRABGRASS CUTTING AND RAKING IMPLEMENT
Robert L. Bordas, Garden City, N. Y.
Application May 15, 1953, Serial No. 355,280
10 Claims. (Cl. 56—400.07)

1. A lawn-weed cutting implement, comprising a rigid prong-support and spacer member, an operating handle fixed thereto for manipulation of the implement; flexible rake prongs carried by the support member to extend therefrom in a direction opposite that of the handle; and blade-carrying means attached to the support member including means for retaining rigidly, for operation, cutting blades in a substantially vertical plane when the implement is drawn manually by the operating handle, with downward pressure exerted thereon, over turf infested with weeds, the severed weed portions being collected by said rake prongs.



2,770,091
CONTROL UNIT FOR CABLE SPINNING MACHINE
Theodor Frankel, Rochester, N. Y., assignor, by mesne assignments, to General Dynamics Corporation, a corporation of Delaware
Application January 7, 1954, Serial No. 402,688
11 Claims. (Cl. 57—51)

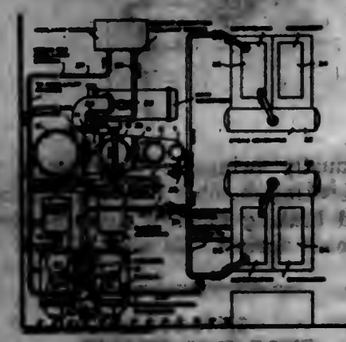
1. A control unit for a cable spinning machine comprising; a plurality of insulated conductors, means for causing said conductors to be formed into a cable, means for continuously checking the electrical continuity of said conductors during the formation of said cable, and means for stopping said cable forming means responsive to the occurrence of an electrical discontinuity in any of said conductors.

2,770,092
BRAKE FOR SPINNING OR TWISTING SPINDLE
Earl S. Wood, Whitinsville, Mass., assignor to Whitin Machine Works, Whitinsville, Mass., a corporation of Massachusetts
Application January 11, 1954, Serial No. 403,301
1 Claim. (Cl. 57—93)

In a textile machine having spindles comprising blades and whirls and having spindle bases therefor provided with offset and upwardly-extending oil spouts, that improvement for each spindle which consists in an oil cover mounted on a fixed vertical pivot, a braking member which is resilient in part and which is mounted to swing about said vertical pivot with said cover manually-releasable means to lock said cover and said braking member together in a horizontal operative angular position, a brake element mounted on said braking member and movable towards said spindle to engage a side wall of said whirl, and a cam lever mounted on said fixed vertical

pivot and manually swingable horizontally relative to the cover and braking member to engage an intermediate portion of said braking member and effective to force said brake element against said whirl.

2,770,093
SPINNING FRAME
Eugene Cleveland Gwaltney, Biddeford Pool, Maine, assignor to Saco-Lowell Shops, Boston, Mass., a corporation of Maine
Application October 4, 1951, Serial No. 249,732
6 Claims. (Cl. 57—99)



1. A lifting mechanism for spinning frames of the type having a plurality of spinning instrumentalities extending along either side of a frame including spindles on opposite sides of said frame, a plurality of horizontally spaced vertical guide members on opposite sides of said frame, slide means mounted on said guide members for vertical movement on said guide members, yarn guiding devices mounted on and movable with said slide means, tie rods extending between said slide means on opposite sides of said frame and vertically movable with said slide means for maintaining said yarn guiding devices in axial alignment with the respective spindles, means for moving said slide means and said yarn guiding devices including a builder mechanism arranged and controlled to provide a reciprocating builder motion and drive means connecting said builder mechanism and said slide means for moving said slide means along said guide members in response to the movement of said builder mechanism.

2,770,094
MULTIPLE EXPANSION RECIPROCATING STEAM ENGINE WITH TURBINE OPERATING FROM INTERMEDIATE STAGE
Angelo A. Fabius, Washington, D. C.
Application October 6, 1952, Serial No. 313,909
2 Claims. (Cl. 60—31)

1. In an elastic fluid marine power installation, in combination, a supply of live steam and a multiple expansion reciprocating steam engine comprising at least three stages of expansion, turbine means connected to an intermediate

expansion stage of said engine for receiving steam from the exhaust of said intermediate stage, a reheater having separate flow passages, the first connected to said supply of live steam and the second connecting the intermediate expansion stage and the turbine means to receive the exhaust steam from said intermediate said expansion stage, an auxiliary engine connected to said reheater for receiving steam from said first passage after said steam has re-

heated the exhaust steam from the intermediate expansion stage, a partition fixed with valve means placed between the exhaust of the intermediate stage of expansion and the low pressure stage of expansion whereby, by closing the valves, the steam is diverted from said low pressure stage to said turbine means, a steam passage between said auxiliary engine and the low pressure stage of expansion engine to convey exhaust steam to the reciprocating engine.

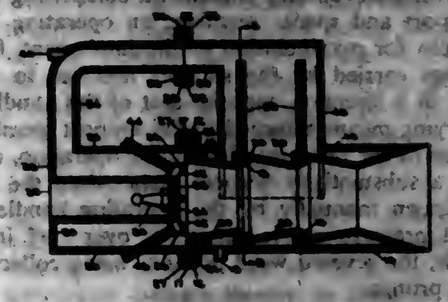
---

2,770,895
**JET DEFLECTOR HAVING CURVED GUIDE WALL FOR AIRCRAFT**
Peter Frederick Ashwood, Farnham, and Philip John Fletcher, Farnborough, England, assignors to Power Jets (Research and Development) Limited, London, England, a British company
Application May 26, 1953, Serial No. 357,117
Claims priority, application Great Britain May 30, 1952
9 Claims. (Cl. 60—35.54)

1. A jet nozzle unit for a jet propelled aircraft, for directing the jet rearwardly or deflecting the jet and comprising walls constituting a nozzle, and defining a nozzle orifice discharging to atmosphere, a guiding boundary wall extending outside the nozzle beyond the said nozzle orifice to form a smooth continuation of that one of said nozzle walls which is on that side of the nozzle towards which it is desired to deflect the jet, said guiding wall curving round into a direction transverse to the direction of the nozzle walls, and means operable at will to cause the issuing jet to separate from said guiding wall or to follow the curvature of said guiding wall into a path transverse to the direction of the nozzle walls.

---

2,770,896
**CONTINUOUS COMBUSTION CHAMBER WITH AIR FLOW AND TURBULENCE CONTROLLED BY FLAME FRONT POSITION**
Homer M. Fox, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware
Application September 15, 1952, Serial No. 309,655
10 Claims. (Cl. 60—39.29)



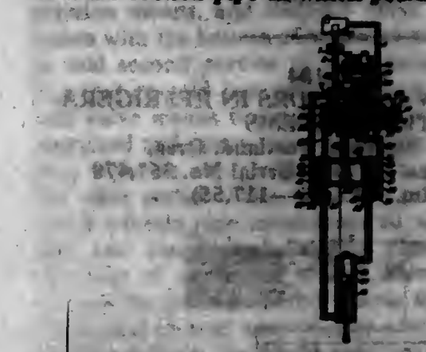
9. In a continuous combustion power plant, the improvement which comprises means for determining the position of the flame front in the burner tube; and means operatively connected with the first said means for varying the fuel-air ratio in the primary combustion zone in

response to the position of the flame front in the burner tube.

---

2,770,897
**COOLING SYSTEMS FOR ENGINES THAT UTILIZE HEAT**
William C. Walker, Granite City, Ill.
Application February 14, 1952, Serial No. 271,483
13 Claims. (Cl. 60—39.55)

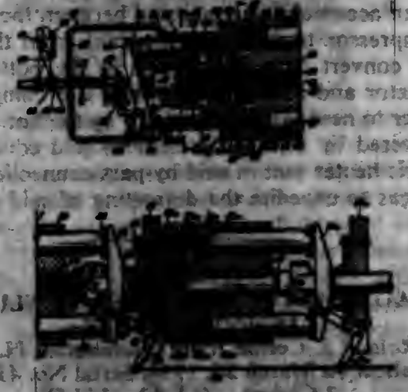
7. In an engine which utilizes heat, the improvement that comprises a substantially continuous metal hot wall for said engine, a casing disposed outwardly of said hot wall of said engine to define a vaporization chamber between said hot wall of said engine and said casing, said vaporization chamber being in heat-transferring relation with the outer surface of said hot wall of said engine, said vaporization chamber being vapor-tight, an inlet in said vaporization chamber to admit liquid, an opening in said hot wall that communicates with the inner surface of said hot wall, said opening being spaced from said vaporization chamber so liquid within said vaporization chamber can not flow through said opening and onto said inner surface of said hot wall, a duct extending between said opening and the upper part of said vaporization chamber to conduct vapor from said vaporization chamber to said opening and thus to said inner surface of said hot wall, said vaporization chamber being adapted to receive liquid that can respond to heat from said hot wall to vaporize and flow in the vapor state to said opening and onto said inner surface of said hot wall, said hot wall defining a combustion chamber which has an outlet for hot gases, said opening being in confronting relation to said outlet and being immediately adjacent the inner surface of said hot wall of said engine whereby vapors issuing from said opening are directed toward said outlet.



---

2,770,898
**HYDRAULIC SERVO-MOTORS**
Eberhard Kaderawek, Stuttgart-Feuerbach, and Gustav Schmidt, Stuttgart-Vaihingen, Germany, assignors to Robert Bosch G. m. b. H., Stuttgart, Germany
Application February 24, 1953, Serial No. 339,861
Claims priority, application Germany March 12, 1952
11 Claims. (Cl. 60—52)

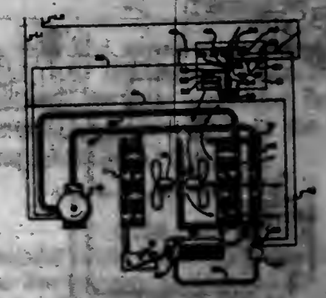
1. A control device for hydraulic servo-motors, including in combination, a housing, a first control member, a second control member both in said housing, a suction pipe and a pressure pipe leading from said control members to a hydraulic pump, two working pipes connected to a working cylinder, means to connect said working pipes with said pressure pipe, stop valves in said working pipes, a control pipe connecting said working pipes with said control members, means operated by the



first control member connecting in one operative position the pressure pipe with a working pipe and the pressure pipe with the control pipe, and in a second operative position the pressure pipe to the second working pipe and the pressure pipe to the control pipe, means to connect the other working pipe in each of said operative positions with the suction pipe in which positions said second con-

trol member is inoperative, means in the position of rest to effect by the first control member a connection between the pressure and suction pipes through a by-pass, in addition to a connection between the two working pipes, and means in the position of rest to effect by the second control member a connection of the control pipe with either the suction or pressure pipe.

---



2,770,899
**ROTARY PUMP AND MOTOR HYDRAULIC TRANSMISSION AND SPEED VARYING MECHANISM THEREFOR**
Giovanni Bodoira, Milan, Italy
Application January 24, 1951, Serial No. 207,464
Claims priority, application Italy March 3, 1947
4 Claims. (Cl. 64—23)

1. A hydraulic speed changing device comprising, in combination, a pump having a housing and a driving shaft, a hydraulic motor having a housing and a driven shaft, said pump and said motor being hydraulically coupled with each other, said driving shaft being fixed to said pump housing and extending thereinto, said driven shaft being fixed to said motor housing and extending therethrough coaxially with said driving shaft, one end of said driven shaft extending into said pump housing, a wobble plate within said pump housing and pivotally mounted on said one end of said driven shaft, a stationary stub shaft arranged coaxially with said driven shaft adjacent the other end of the latter, a guide plate pivotally mounted on said stub shaft, a first set of pistons and a second set of pistons, said first and second sets of pistons being reciprocatingly movable in said pump housing and in said motor housing, respectively, and arranged to perform variable strokes, spherically dished shoes receiving the ends of said pistons respectively, spring means urging said pistons and shoes toward said wobble plate and said guide plate, said shoes for said first set of pistons being in sliding contact with and controlled by said wobble plate, said shoes for said second set of pistons being in sliding contact with and controlled by said guide plate, whereby rotative movement of said driving shaft and of said pump housing fixed thereto is hydraulically transmitted to said motor and translated into a rotative movement of said motor housing and of said driven shaft fixed thereto, and means outside said pump housing and said motor housing, respectively, for changing the inclination of said wobble plate and said guide plate, respectively, relative to said driving shaft and said driven shaft.

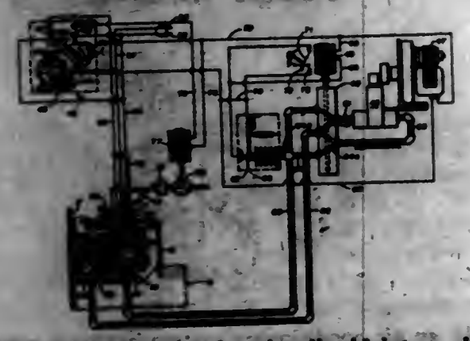
---

2,770,100
**AIR CONDITIONING CONTROL**
Estel C. Raney, Fort Lauderdale, Fla., assignor to Ranco Incorporated, Columbus, Ohio, a corporation of Ohio
Application June 21, 1954, Serial No. 437,971
5 Claims. (Cl. 62—4)

5. In an air conditioning system having a compressor, and an evaporator comprising a refrigerating circuit, electrically controlled means to control operation of the compressor, electrically controlled means to reheat air chilled by the evaporator, control means for both said electrically controlled means comprising two movable switch members movable to control the first and second electrically controlled means respectively, and a thermally responsive expansible element adapted to move one of said switch members upon a predetermined expansion thereof and to move the other of said switch members upon a predetermined greater expansion.

---

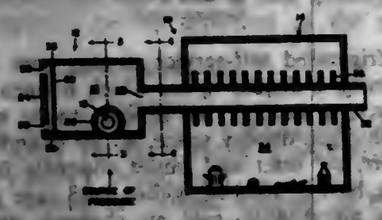
2,770,101
**REFRIGERATED DISPLAY CASE**
Victor W. Smith, Trenton, N. J., assignor to C. V. Hill & Company, Inc., Trenton, N. J., a corporation of New Jersey
Application June 11, 1953, Serial No. 361,008
5 Claims. (Cl. 62—4)



1. A refrigerated self-service display case comprising means forming a display space which is open for access to customers, a support for articles to be refrigerated located within the display space, an air chamber beneath said support, air inlet and outlet channels for said air chamber, a blower located within said case in position to circulate air through said air channels and said air chamber to and from the display space, means in said case for refrigerating the air thus circulated, a compressor for delivering refrigerant to said refrigerating means, electrical circuit means for energizing said blower and said compressor, said circuit means including a thermostat for establishing "on" and "off" cycles of operation

of said compressor and a contact for normally maintaining an "on" cycle of operation of said blower, and a single temperature responsive means located within said case in the path of circulation of air by said blower for directly moving said contacts, said blower contact being operated when the temperature of the air being circulated by said blower presents an undesired condition of refrigeration in said display space.

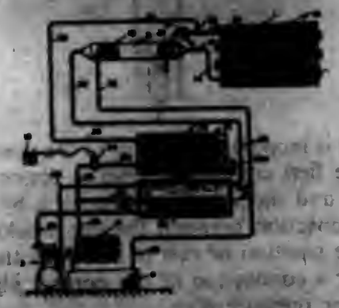
---



2,770,102
AUTOMATIC ICE MAKER
Henry E. Roedter, Cincinnati, Ohio, assignor to Avco Manufacturing Corporation, Cincinnati, Ohio, a corporation of Delaware
Application March 29, 1954, Serial No. 419,238
6 Claims. (Cl. 62—7)

1. Automatic means for freezing liquid into a discrete mass of definite shape designed for installation and use in a refrigerated environment having means for absorbing heat comprising a mold in heat transfer relationship with said heat absorbing means, said mold defining a mold cavity, a non-metallic flexible liner flexibly disposed within the mold cavity and secured to said mold in sealing engagement therewith adjacent the top edges of the cavity, said liner being fitted closely within the cavity by evacuation thereof, means for supplying a measured quantity of liquid to said liner when disposed within the mold cavity, a reservoir in heat transfer relationship with the refrigerated environment, working fluid in the reservoir at least equal in volume to the volume of the mold cavity, and pumping means for withdrawing working fluid from the reservoir and forcing it under pressure into the mold cavity beneath said liner for flexing and inverting said liner and ejecting from said liner frozen liquid having substantially the shape of the mold cavity, said pumping means comprising the sole means for ejection of the frozen liquid.

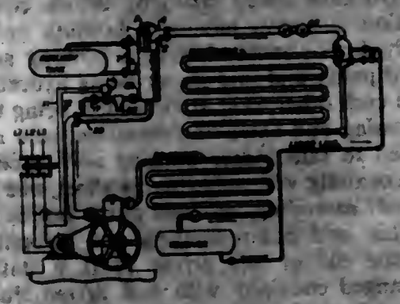
---



2,770,103
PORTABLE COOLING DEVICE FOR FLUIDS AND FOOD
Harold R. Fierce, Wantagh, N. Y.
Application March 26, 1954, Serial No. 419,119
3 Claims. (Cl. 62—96)
(Granted under Title 35, U. S. Code (1952), sec. 266)

1. A portable refrigerator unit comprising a cylindrical chamber, inlet means tangentially secured to said chamber to supply an incoming air stream whereby an outer heated portion and a coaxial cooled portion are obtained by rotational action of the incoming air stream in the cylindrical chamber, an annularly slotted outlet at one end of said chamber, said annularly slotted outlet being adjacent the periphery of said cylindrical chamber, a valve disk rotatably mounted in said chamber adjacent said slotted outlet to control the flow of the heated portion, an axial outlet at the other end of said chamber, a refrigerator chamber connected to said axial outlet and heat exchange means in said refrigerator chamber.

---

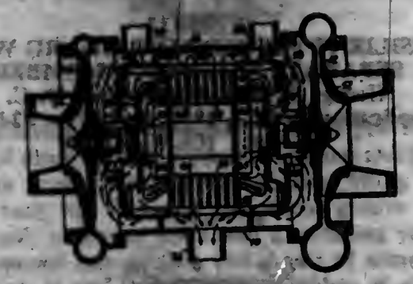


2,770,104
DEFROSTING EVAPORATORS IN REFRIGERATION SYSTEMS
Stanley J. Sweyner, Portland, Oreg.
Application June 15, 1953, Serial No. 361,470
1 Claim. (Cl. 62—117.55)

In a refrigeration system including a compressor for delivering hot compressed gas refrigerant, a condenser connected with said compressor to receive the gas refrigerant therefrom, an evaporator connected between said condenser and said compressor to receive condensed liquid refrigerant from said condenser and return gaseous refrigerant to said compressor, a by-pass connection directly between said compressor and said evaporator, and by-passing said condenser to deliver gas refrigerant from said compressor to said evaporator to defrost said evaporator, an accumulator connected between the evaporator and compressor to receive refrigerant from the evaporator and convert it to gas, a coil in the bottom of said accumulator and connected between said compressor and condenser to heat said accumulator by the hot compressed gas delivered by said compressor to said condenser, and an electric heater unit in said by-pass connection for heating the gas to expedite the defrosting of said evaporator.

---

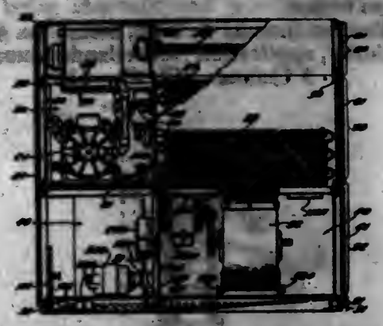
2,770,105
AUTOMATIC REFRIGERANT SLUG DISINTEGRATOR
Roland J. Colton, Port Washington, N. Y.
Application March 25, 1954, Serial No. 418,609
2 Claims. (Cl. 62—117.7)



1. In a refrigerating system of the compression type having a high side including compression means driven by an electrically controlled prime mover, condensing means and a receiver to receive liquid refrigerant and having an expansion valve connected thereto, and also having a low side including an evaporator connected to the output of said expansion valve, and a conduit connecting said evaporator to the inlet of said compression means; an accumulator tank connected in series with said conduit whereby a portion thereof extends into said accumulator and comprises a gaseous refrigerant inlet having its inner extremity spaced apart from both the upper and the lower ends thereof, a second portion of said conduit having an open end terminating within said accumulator tank at a higher level than the end of said extremity, said second mentioned portion of said conduit leading from said accumulator to the inlet of said compression means, and solenoid valve means in communication with the bottom of said accumulator and connected to said second portion of the conduit for delivering refrigerant to said last mentioned portion of said conduit said valve means being actuated by a solenoid which is energized and opens the valve orifice and holds it open in time with the energization of said prime mover so that the valve orifice closes when the prime mover is at rest, and a tell-tale pipe interconnected with said accumulator tank and comprising a vertical pipe which is under the influence of refrigerant in said accumulator and adapted to have the portion thereof above the level of the liquid refrigerant in said accumulator coated with frost and to thereby indicate the liquid refrigerant level in said accumulator.

---

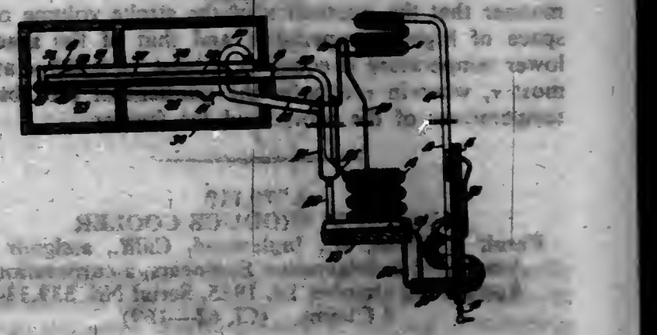
2,770,106
COOLING MOTOR COMPRESSOR UNIT OF REFRIGERATING APPARATUS
Arthur M. G. Moody, La Crosse, Wis., assignor to The Trane Company, La Crosse, Wis., a corporation of Wisconsin
Application March 14, 1955, Serial No. 493,851
4 Claims. (Cl. 62—117.5)



3. In refrigerating apparatus, the combination of an evaporator for vaporizing refrigerant, a condenser for liquefying refrigerant, a compressor for circulating refrigerant through said evaporator and condenser, a substantially cylindrical casing secured in fluid tight contact at one end with said compressor, a motor frame in said substantially cylindrical casing and spaced with respect to said substantially cylindrical casing, partitions between said frame and said substantially cylindrical casing defining a central chamber and two end chambers, a stator secured to said frame, bearings secured to each end of the frame, a shaft and rotor assembly rotatably mounted in said bearings, said shaft and rotor assembly extending into said compressor, an impeller in said compressor, said impeller being secured to said shaft and rotor assembly for rotation therewith, fan means secured to said shaft and rotor assembly for moving gas from said end chambers over the surfaces of said stator and thence into said central chamber, means for conducting gas from said evaporator to said end chambers and means for conducting gas from said central chamber to said evaporator.

---

2,770,107
AIR TO AIR HEAT PUMP APPARATUS
Russell H. Barnes, Chicago, Ill., assignor to Drying Systems, Inc., Chicago, Ill., a corporation of Illinois
Application February 15, 1954, Serial No. 410,203
4 Claims. (Cl. 62—117.5)

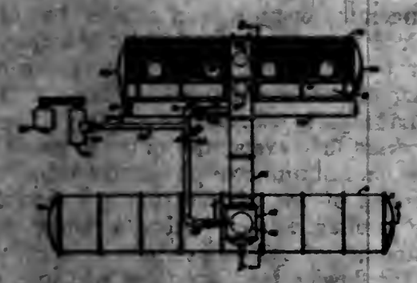


1. In an air to air heat pump apparatus having inside and outside air-circulating passages and a refrigerating system with heat exchangers in said outside and inside air-circulating passages for a winter heating cycle, means affording a fully closed heat and sound insulated compressor chamber, compressor means forming part of said refrigerating system and mounted and housed within said chamber, and a finned superheater forming part of said

refrigerating system and mounted on the refrigerant suction line thereof, said superheater being located in said compressor chamber to heat expanded refrigerant and thereby utilize the compressor heat in the heating cycle of the heat pump apparatus.

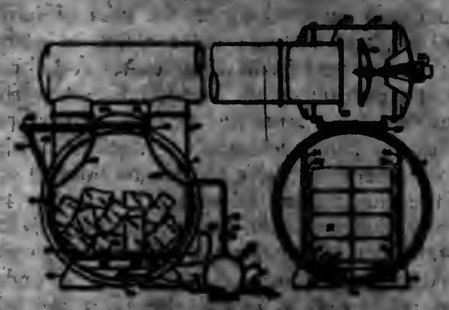
---

2,770,108
ABSORPTION REFRIGERATION
Sigurd Mattias Backstrom, Stockholm, Sweden, assignor to Aktiebolaget Elektrolux, Stockholm, Sweden, a corporation of Sweden
Application January 21, 1953, Serial No. 332,364
Claims priority, application Sweden January 23, 1952
10 Claims. (Cl. 62—119.5)



6. A refrigerator comprising a cabinet having an interior provided with spaces thermally segregated from one another, an absorption refrigeration system having a circuit for circulation of inert gas including an absorber and low and higher temperature cooling elements in which refrigerant fluid evaporates in the presence of such gas, said low temperature cooling element being arranged to effect cooling of one of said spaces and said higher temperature cooling element being arranged to effect cooling of another of said spaces, first conduit means in said circuit for flowing inert gas from said low temperature cooling element to said higher temperature cooling element and from the latter to said absorber, and second conduit means in said circuit for flowing inert gas from said absorber in thermal exchange relation successively with said higher temperature cooling element and said low temperature cooling element and then introducing such inert gas into the presence of refrigerant fluid in said low temperature cooling element, said second conduit means also including means for diverting into the presence of refrigerant fluid in said higher temperature cooling element a part of the inert gas flowing therethrough after such gas flows in heat exchange relation with said higher temperature cooling element.

2,770,109
[illegible] AND COOLED CHAMBER CONSTRUCTION OF A COLD-GAS REFRIGERATOR
[illegible] and Leendert de Lange, Eindhoven, Netherlands, assignors to Hartford National Bank and Trust Company, Hartford, Conn., as trustee
Application January 6, 1955, Serial No. 480,126
Claims priority, application Netherlands January 15, 1954
3 Claims. (Cl. 62—136)



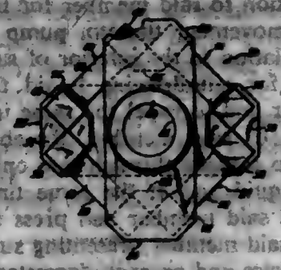
1. A refrigerator of the type described provided with a first space having a temperature lower than —40° C. and a second space having a higher temperature than said first space, further comprising a cooler, a regenerator, a freezer, said first and second spaces being in open communication with each other through said cooler, regenerator and freezer, a cylinder means enclosing said first and second spaces, a gas of invariable chemical composition performing a closed thermodynamic cycle in said refrigerator, two pistons for reciprocation in said cylinder means to thereby vary the volume of said gas in said spaces, said refrigerator being proportioned in such a manner that the quotient $\nu$ of the stroke volume of the space of higher temperature and that of the space of lower temperature is equal to at least $1+0.025\ \tau$ and at most $\tau$, wherein $\tau$ denotes the quotient of the absolute temperatures of the cooler and the freezer.

2,770,110
VACUUM PRODUCE COOLER
Frank J. Hilke, Jr., Inglewood, Calif., assignor to Associated Refrigerating Engineers, a corporation
Application October 10, 1955, Serial No. 539,334
4 Claims. (Cl. 62—169)

1. A vacuum produce cooler for use with a produce tube comprising a refrigerator tube, means for supporting a heat absorber in said refrigerator tube, a drain tank, means for connecting said drain tank to said refrigerator tube near the bottom thereof and to the atmosphere, valves in said connecting means, a vacuum pump, a suction manifold in said refrigerating tube on one side of said heat absorber supporting means, means for connecting said suction manifold to said pump, an inlet manifold in said refrigerating tube on the other side of said heat absorber supporting means, and means for connecting said inlet manifold to said produce tube.

2,770,111
VACUUM PRODUCE COOLER
James C. Rose, Berkeley, Calif., assignor to The United Ice Company, a corporation
Application October 14, 1955, Serial No. 539,389
3 Claims. (Cl. 62—169)

1. A vacuum produce cooler for use with a produce tube comprising a refrigerator tube, an ice supporting grid in said refrigerator tube, hatches in said refrigerator tube for ingress of ice to said grid, a drain tank, means for connecting said drain tank to said refrigerating tube beneath said grid and to the atmosphere, valves in said connecting means, a vacuum pump, a perforated suction manifold in said refrigerating tube beneath said grid, means for joining said suction manifold to said pump, inlet manifolds in said refrigerating tube above said grid, and means for connecting said inlet manifolds to said produce tube.



2,770,112
RESILIENT FINGER RING GUARD WITH SEPARATE MOUNTING MEMBER
George S. Butts, Washington, D. C.
Application July 27, 1955, Serial No. 524,709
1 Claim. (Cl. 63—15.6)

A finger ring guard comprising a support member and a resilient finger-engaging member, said support member comprising an elongated body, legs and arms on said body, said legs being an extension of said body at both ends, said arms being transverse to said body and adjacent the ends thereof and being adapted to bend around said ring to hold said body in close engagement throughout its length with the lower portion of the inner surface of said ring, said legs being bent back upon themselves to form locking flanges, said resilient finger engaging member comprising an oval shaped spring having its ends secured to the locking flanges to maintain said spring in a normally horizontal position in said ring.

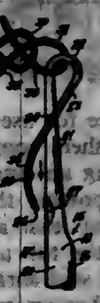
2,770,113
FLEXIBLE COUPLING
Maurice Nolles, Elmhurst, Ill., assignor to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois
Application October 26, 1953, Serial No. 388,350
2 Claims. (Cl. 64—12)

1. A flexible coupling for shafts comprising, a pair of flanged hub members disposed in spaced confronting relationship with respect to each other, and flexible interconnecting means disposed between said flanged members comprising a plurality of rubber link-like elements disposed in an annular array with the extreme end portions thereof being respectively immovably bonded directly to opposed flanges of said flanged members, each of said link-like elements comprising a narrow web interconnecting wide flat ends thereof, said web being axially de-

flectable responsive to angular or parallel misalignment of the flanged members.

2,770,114
UNIVERSAL JOINT ASSEMBLY
William W. Slaght, Rocky River, Ohio, assignor to Cleveland Steel Products Corporation, Cleveland, Ohio, a corporation of Ohio
Application March 22, 1954, Serial No. 417,890
5 Claims. (Cl. 64—17)

1. A universal joint comprising a cross provided with two pairs of diametrically opposite trunnions axially alined on crossing axes, a bearing cup slidably fitting on each trunnion, each cup having a peripheral groove adjacent its inner end, a driving yoke and a swinging yoke each having a central hub portion and a pair of arms integral with the hub at one end thereof, the arms of each yoke being offset radially outwardly from the hub and extending axially on opposite sides of the hub axis, the arms of each yoke having axially alined openings in which the bearing cups of alined trunnions slidably fit and through which said cups can be inserted onto the trunnions or removed from the trunnions, each of the arms of the swinging yoke being formed in one piece, the arms of the driving yoke being divided substantially in a plane normal to the yoke axis and across the openings to provide separable caps which are removable to detach said cross from said driving yoke without removal of bearing cups, a pair of bolts detachably holding each cap in place, the bolts of each pair extending axially on opposite sides of the cup receiving opening, a spring clip removably mounted in the peripheral groove of each of said bearing cups and engaging the inner face of a yoke arm to hold said cups against outward movement, and spring retaining means attached to said cross and yieldably engaging the grooves of the bearing cups that are mounted in said driving yoke to releasably hold the same on their trunnions when said cross is detached from said driving yoke.

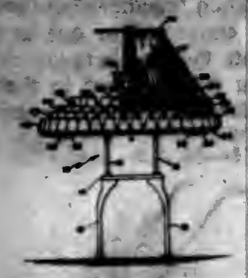


2,770,115
OVERLOAD RELEASE FRICTION COUPLING
Howard C. Ober, Lyndhurst, Ohio
Application August 14, 1953, Serial No. 374,174
3 Claims. (Cl. 64—30)

1. In a device including a shaft member having a peripheral wall, bearing means supporting the shaft member for rotation about its axis, a second member, a clamp on the second member and having wall portions normally in tight clamping engagement with the peripheral wall of the shaft member and thereby drivingly connecting the members for rotation together about said axis, and power means drivingly connected to one of the members and operative to rotate the members at relatively high speed, said clamp being characterized in that those of its said wall portions which are in clamping engagement with said

peripheral wall are composed of bearing metal which is sufficiently softer than the peripheral wall so that the bearing metal cannot score the peripheral wall due to rotation of the said one of the members relative to the other of said members occasioned by instantaneous stopping of the said other of the members while said wall portions are in their normally tight clamping relation.

2,770,116
MEANS AND METHOD FOR PRODUCING KNITTED FABRICS
Joseph L. Morris, Elmhurst, N. Y.
Application January 21, 1955, Serial No. 483,342
2 Claims. (Cl. 66—119)



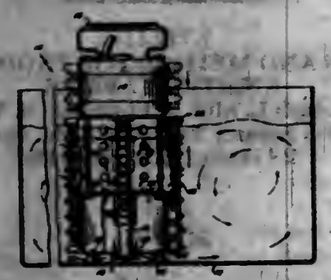
1. A spring beard knitting needle comprising a needle with front, rear and right and left side portions and a shank with an elongated tapered portion at one end terminating in a bend and hook with a spring beard, said beard having a spring tip, said tapered portion having a recess at the rear thereof adapted removably to receive said spring tip, said hook being at the front of the needle and said beard extending from the hook toward the shank and across the left side of the tapered portion and spaced from said side and from the rear of the needle, said spring tip being disposed adjacent to and centered with the recess at the rear of the needle, said beard being spaced a predetermined distance from said side and a predetermined distance from the rear of the needle, said predetermined distances being those sufficient for yarn to pass between the beard and said side and rear of the needle, said recess being an elongated slot.

2,770,117
YARN RACK FOR CIRCULAR KNITTING MACHINE
Sam Mishcon, Bell Harbor, Lester Mishcon, Woodmere, and Harry Agatstein, Brooklyn, N. Y., assignors to Supreme Knitting Machine Co. Inc., Brooklyn, N. Y., a corporation of New York
Application February 5, 1954, Serial No. 406,592
9 Claims. (Cl. 66—125)

1. In a multiple feed circular knitting machine a yarn rack for yarn cones, said cones positioned on said rack

in more than one plane in upwardly converging stepped formation, and adapted to form a canopy and umbrella-

like compartment under the said yarn rack to afford headroom for an attendant machine operator.



---

**2,770,118**

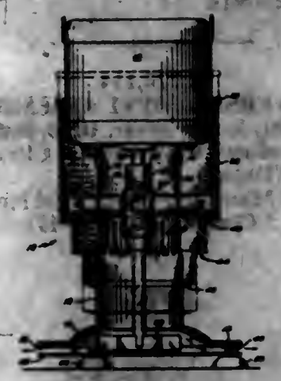
**WASHING OR SCRUBBING DEVICE WITH OSCILLATING SCRUBBING MEMBER HAVING A VERTICAL COMPONENT OF MOTION**

Richard R. Walton, Boston, Mass., assignor to Walton Washing Machine Corporation, Boston, Mass., a corporation of Massachusetts

Application September 13, 1952, Serial No. 309,517
15 Claims. (Cl. 68—28)

1. A washing device for use in a tub to contain liquid and articles to be washed, comprising, in combination, a hollow member having an external article engaging surface, means for supporting the same in the tub, said member being open at least at that side thereof which faces the bottom of the tub and being provided over a substantial portion of said surface with a multiplicity of openings, driving mechanism mounted in driving connection to said hollow member for imparting movement thereto such that the movement of said surface includes a downward component of motion, pump means mounted in operative relation to the interior of said hollow member and arranged to withdraw liquid therefrom and to expel it into the tub beneath the periphery of said open side thereof, the cross-sectional area of said hollow member throughout the remaining portion thereof being at least as great as the cross-sectional area of the portion thereof adjacent said open side and the action of said pump means causing liquid from the tub to cascade inwardly through said openings to replace the expelled liquid and at the same time to carry the articles towards said hollow member and press portions of the articles against said article engaging surface.

---



**2,770,119**

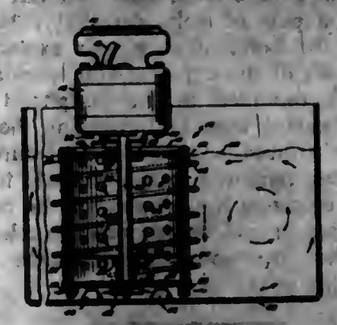
**WASHING DEVICE WITH MEANS FOR INJECTING AIR BUBBLES IN THE WASHING LIQUID**

Richard R. Walton, Boston, Mass., assignor to Walton Washing Machine Corporation, Boston, Mass., a corporation of Massachusetts

Application January 12, 1955, Serial No. 481,390
3 Claims. (Cl. 68—28)

1. A washer unit, for use in a tub containing liquid and articles to be washed, comprising a hollow scrubbing member open at its lower end, said hollow scrubbing member being provided over substantially the whole of its immersed surface with a multiplicity of openings and being throughout of cross-sectional area at least as great as that of its lower end, driving mechanism mounted in driving relation to said member for imparting vertical reciprocating movement thereto, pump means mounted in operative relation to the interior of said hollow scrubbing member for withdrawing liquid from within said hollow member and to expel the same into the tub from the lower end of said member, thereby causing liquid from the tub to cascade through said openings to replace the expelled liquid and at the same time to carry said articles toward said member and press the same against said member, said member presenting surface portions to engage the articles and on each downstroke of said member to push the articles downwardly toward the output

stream of said pump means, and a casing mounted within said member providing a wall extending upwardly from the intake of said pump means within said scrubbing member, said wall defining an intake conduit for said pump means, said casing being in free communication with the atmosphere and being provided with restricted liquid admitting openings communicating between said intake conduit and the interior of said scrubbing member, said openings being of predetermined limited aggregate cross-sectional area in relation to the capacity of said pump means limiting the flow of liquid to the latter to less than its capacity so that said pump means will draw air in addition to liquid and force the same as air bubbles into the output stream thereof.



---

**2,770,120**

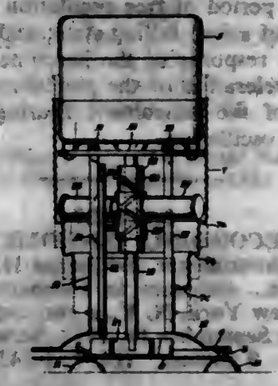
**WASHING DEVICE WITH ROTARY SCRUBBER**

Richard R. Walton, Boston, Mass., assignor to Walton Washing Machine Corporation, Boston, Mass., a corporation of Massachusetts

Application December 28, 1953, Serial No. 400,568
9 Claims. (Cl. 68—28)

1. A scrubbing device for use in a container holding liquid and articles to be scrubbed comprising a generally cylindrical hollow body having a plurality of openings, a mounting for said body permitting rotation thereof and supporting the same at a predetermined level within said container, a rotatable shaft mounted centrally of said mounting, and adapted to be driven from one end thereof, a portion of said shaft extending substantially to the level of the lower portion of said hollow body, impeller means

connected to said portion of said shaft adapted to force liquid radially outwardly from beneath said hollow body while drawing liquid toward and through the openings in said body to replace the liquid so withdrawn and drawing any articles carried in said liquid against the outer surface of said body, means for imparting rotation to said hollow body during rotation of said shaft, said body being provided with at least one external generally spirally arranged rib adapted to convey any articles of clothing in contact therewith downwardly toward the output stream of said impeller during rotation of said body.



---

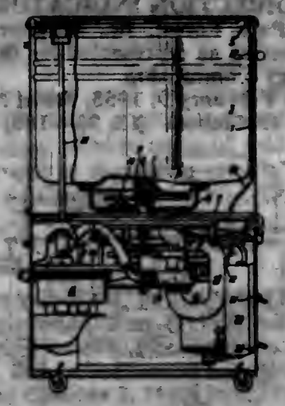
**2,770,121**

**WASHING MACHINE**

William H. Kuntz, Grand Rapids, Mich.

Application April 23, 1953, Serial No. 350,644
11 Claims. (Cl. 68—38)

7. A portable, power operated, fluid circulating and washing machine adapted to be placed in receptacles of various sizes and shapes for washing fabrics within said vessels, said washing machine including a pump with a water inlet and a peripheral water outlet positioned substantially therebelow; means including an electric motor for driving said pump, and means for injecting air bubbles into fabrics adjacent the washing machine to impart buoyancy thereto whereby they will be carried to said machine by flotation and by the fluid currents induced by said circulating means; said last named means including a slender tube having one end projecting into the water inlet of the pump, with its other end open to the atmosphere.



---

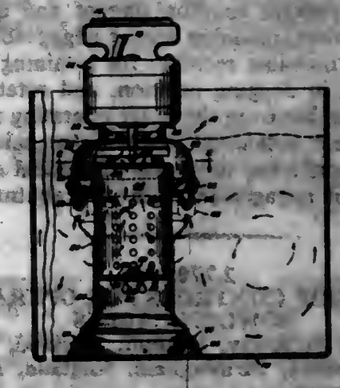
**2,770,122**

**WASHING MACHINES**

Kenneth Jackson, Oldham, England, assignor to H. Fisher (Oldham) Limited, Oldham, England

Application November 8, 1954, Serial No. 467,545
Claims priority, application Great Britain
November 23, 1953
6 Claims. (Cl. 68—133)

1. A washing machine comprising a wash tub; a shaft rotatably mounted in the bottom of the wash tub; a pulsator within the wash tub carried by the shaft; and means including an electric motor outside the wash tub for driving the shaft; said pulsator formed as a circular member with more than half of its upper working surface raised above the plane of its rim and divided by a transverse ridge into two portions whereof the leading portion considered with respect to the direction of rotation of the pulsator increases progressively in height up to said ridge and the trailing portion progressively decreases in height, the remaining portion of said working face being a flat bottomed depression below the plane of the rim, and all said portions merging smoothly without sharp abutments.



---

**2,770,123**

**WASHING DEVICE, INCLUDING JET MEANS FOR CIRCULATING THE ARTICLES BEING WASHED**

Richard R. Walton, Boston, Mass., assignor to Walton Washing Machine Corporation, Boston, Mass., a corporation of Massachusetts

Application January 5, 1954, Serial No. 402,965
5 Claims. (Cl. 68—184)

5. A washing device for use in a tub to contain liquid and articles to be washed, comprising, in combination, a stationary generally cylindrical hollow member, the cylindrical wall thereof forming an external article engaging surface, a hollow base member mounting said first named member in spaced relation to the bottom of said tub in upright fashion so that said surface is generally vertically arranged, said cylindrical member having a substantial opening at the upper end thereof and being provided over substantially the whole of the immersed portion of its said cylindrical wall with a multiplicity of liquid admitting ports, an impeller mounted on the upper end of said cylindrical member with its intake in communication with said opening for withdrawing liquid from within said hollow member, a motor mounted on said device in driving connection to said impeller, and a plurality of nozzles mounted externally of and near the upper end of said hollow member and in communication with the output of said impeller, said nozzles being directed downwardly at an angle into said tub, operation of said pump means causing liquid from the tub to pour inwardly of said ports to replace the withdrawn liquid and at the same time to carry the articles towards said hollow member and press portions of the articles against said article engaging surface, said liquid being expelled from said nozzles in the form of strong jets for causing circulation in a generally toroidal fashion within said tub of said liquid and any articles carried therein, said cylindrical member and said base being provided with intercommunicating openings and the lower rim of said base being provided with an annular sealing ring adapted to rest on the bottom of the tub, the action of said impeller tending to reduce the pressure within said base member thereby causing it to adhere to the bottom of said tub by atmospheric pressure.

2,770,124
DOOR LOCK
Nicholas A. Welch, West Hartford, Conn., assignor to The American Hardware Corporation, New Britain, Conn., a corporation of Connecticut
Application January 27, 1955, Serial No. 484,407
17 Claims. (Cl. 70—146)

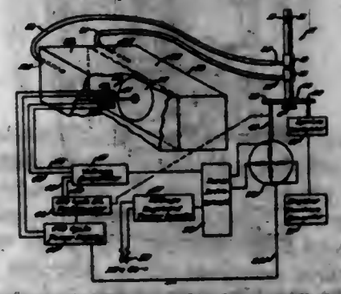
13. A door lock comprising a case, a retractor for a latch bolt in said case, an inner and an outer rollback for operating said retractor, an inner and an outer operating member for rotating its respective rollback to actuate the retractor, said outer rollback being axially movable relatively to its operating member, abutment means engageable by said outer rollback when in dogging position to prevent rotation thereof, a longitudinally movable member operable from the inner operating member for moving said outer rollback into engagement with said abutments to prevent rotation thereof and of the outer operating member, retaining means engageable with said longitudinally movable member for retaining it and said outer rollback in dogging position, and rotatable releasing means operable from the outer operating member for disengaging said retaining means from said longitudinally movable member to permit movement of the outer rollback out of engagement with said abutments.

2,770,125
TWIST-GRIP CONTROLS FOR OPERATING BOWDEN CABLES
Norman John Solloway, Solihull, England, assignor to Ferdax Limited, Birmingham, England, a registered British company
Application May 1, 1952, Serial No. 285,565
3 Claims. (Cl. 70—185)

1. A twist grip control for operating a flexible cable comprising a tubular handle, a co-axial drum on said handle, said drum and said handle being adapted to be mounted for rotation as a unit on a support having the cross section of said tubular handle, said drum having a cable groove and a nipple anchorage, a divided clamp adapted to be secured to said support and having an annular groove in the bore thereof and in which said drum rotatably engages, a cable inlet in said clamp, and a key operated locking bolt rotatably mounted in said clamp, the inner end of said bolt extending into said annular groove and being adapted when turned into the locking position to co-operate with an abutment on said drum to lock said handle against rotary movement whereas in the unlocked position, the said inner end permits said handle to turn.

2,770,126
DEVICE FOR MAKING ACCELERATION TESTS ON SMALL OBJECTS
Ralph E. Brown, Los Angeles, Calif., assignor to Genisco, Inc., Los Angeles, Calif., a corporation
Application March 2, 1953, Serial No. 339,842
14 Claims. (Cl. 73—1)

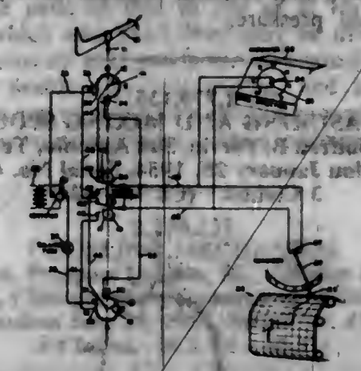
1. In a test device for applying acceleration to an instrument such as an accelerometer, the combination of: a pendulum; a support structure; means pivotally mounting said pendulum on said support structure for free oscillation of the pendulum about a single axis; means to mount the instrument of said pendulum in a position fixed relative to the pendulum; means to apply force to the pendulum to cause acceleration of the pendulum



followed by a period of free oscillation of the pendulum in simulation of a free falling state; and indicator means to indicate the response of the instrument on the pendulum to the acceleration of the pendulum and to indicate the reaction of the instrument during the subsequent period of free oscillation.

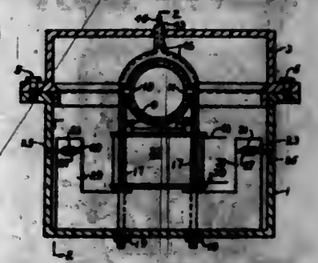
2,770,127
RECORDING TENSIOMETER
Earnest N. Schwensinger and James H. Hoffman, Cumberland, Md., assignors to Celanese Corporation of America, New York, N. Y., a corporation of Delaware
Application September 18, 1952, Serial No. 310,226
9 Claims. (Cl. 73—143)

1. A device for recording the tension in a moving yarn comprising means movable from a predetermined equilibrium position in response to a change in the tension on the yarn, said means including a roller over which the yarn passes, a member having a chamber, a source of fluid pressure connected to said chamber, means for transmitting the fluid pressure in said chamber to said movable means, means actuated by the movements of said movable means in response to increases and decreases of said tension, for returning said movable means to said equilibrium position by a change in fluid pressure in said chamber and means for recording the fluid pressure in said chamber.



2,770,128
ELECTRONIC PRESSURE DIFFERENTIAL WIND DIRECTION INDICATOR
Harry Moses, Park Forest, Ill., assignor to the United States of America as represented by the United States Atomic Energy Commission
Application February 9, 1955, Serial No. 487,229
15 Claims. (Cl. 73—188)

3. An apparatus for sensing wind direction comprising a fully rotatably mounted member having two orifices opening at right angles to one another and radially with respect to the axis of rotation of the member, a chamber, a flexible membrane disposed within the chamber dividing the chamber into two compartments, each compartment being connected by conduit means to one orifice, an electro-mechanical transducer coupled to the membrane for sensing movements of the membrane and generating electrical signals in response thereto, a motor coupled to the rotatably mounted member, and electronic means having an input stage connected electrically to the transducer and having an output stage connected electrically to the motor to form a feedback circuit responsive to imbalance in the air pressure on the orifices whereby the rotatably mounted member is rotated to position the orifices symmetrically with respect to wind direction.



2,770,129
WIND INDICATING AND RECORDING APPARATUS
Clarence W. Dalzell, Princeton, N. J., assignor to Bendix Aviation Corporation, Baltimore, Md., a corporation of Delaware
Application March 15, 1954, Serial No. 416,205
10 Claims. (Cl. 73—188)

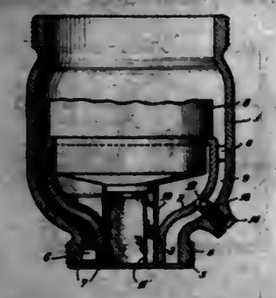
1. In wind direction indicating and/or recording apparatus, a transmitter including a rotatable member adapted to turn in response to changes in direction of the wind, a movable direction indicating and/or recording member, direct current electrical motive means effective to move said latter member to a position corresponding to a given compass point coincident with the angular position of said rotatable transmitter member and in a direction dependent upon the direction of flow of current through said motive means, an electrical circuit including a source of direct current potential and said electrical motive means, resistance means in said circuit arranged to control the rate of flow of current through said motive means and hence the voltage drop thereacross, means for varying said resistance means as a function of the angular position of said rotatable transmitter member, and means synchronized with the turning movement of said rotatable transmitter member interposed in said circuit arranged to direct the flow of current through said motive means in one direction until said indicating and/or recording member moves through a predetermined distance corresponding to a given turning angle of said rotatable transmitter member and to thereupon reverse the flow of current in said motive means.

2,770,130
MAGNETIC FLOW METER
Albert F. Rogatowski, Fort Wayne, Ind., and Lawrence A. Wolseiffer, Wilmington, Ill., assignors to Bowser, Inc., Fort Wayne, Ind., a corporation of Indiana
Application October 3, 1950, Serial No. 188,180
7 Claims. (Cl. 73—194)

1. An apparatus for measuring fluid flow comprising a first non-magnetic, electrically non-conductive tube through which the fluid to be measured flows, a second non-magnetic, electrically conductive tube disposed exteriorly of said first tube, means disposed exteriorly of said tubes for creating a magnetic field across the entire cross-sectional area of said tubes, and output electrodes

extending through the tubes within said magnetic field, said electrodes being insulated from the second tube and communicating electrically with the fluid within the first tube.

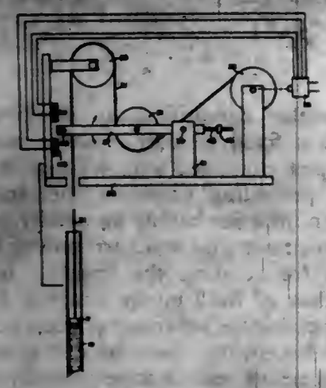
2,770,131
FLOWMETER
Ray C. Sperling, San Gabriel, Calif.
Application July 19, 1954, Serial No. 444,094
4 Claims. (Cl. 73—231)



1. A flowmeter comprising, in combination with a fluid conduit: a fixed support member mounted within the conduit; and elongated axle secured to said support member and projecting upstream therefrom axially of the conduit; an impeller having an axially elongated bore closed at its upstream end and surrounding said axle, and having vanes for rotating the impeller in response to longitudinal flow of fluid in the conduit; bearing means rotatably supporting the upstream portion of said impeller on said axle adjacent the upstream end of the axle; additional bearing means spaced longitudinally from the first mentioned bearing means, rotatably supporting the downstream end portion of the impeller on the axle; said axle having a hollow portion intermediate said two bearing means defining an enclosed cylindrical chamber within the axle; a rotor having a shaft mounted rotatably within said axle and a driven permanent magnet secured to said shaft and located within said enclosed chamber; and a driving permanent magnet secured coaxially to said impeller at a position intermediate the length of said bore and surrounding said driven magnet to rotatably couple said impeller to said rotor.

2,770,132
WATER METER WITH CONCENTRICALLY ARRANGED CONNECTION CHANNELS
Franz Ringe, Nahne, near Osnabrück, Germany, assignor to G. Kromschröder Aktiengesellschaft, Osnabrück, Germany
Application December 29, 1954, Serial No. 478,316
2 Claims. (Cl. 73—273)

1. In a water meter including a generally cylindrical outer housing having an outlet connection snout at one end thereof and a metering mechanism arranged within said housing, an open-ended inner housing mounted within said outer housing coaxially therewith and having an inlet connection snout extending concentrically into said connection snout of said outer housing, said inner housing being spaced from said outer housing to form an annular outlet passageway therebetween, said meter mechanism being mounted in and closing the inner end



of said inner housing leaving a space within said inner housing, and a cylindrical filter body nested within and engaging the inner surface of said connecting snout of

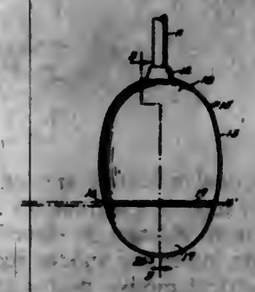
said inner housing and extending into the space within said inner housing and being so constructed and arranged that all water passing through said connecting snout of said inner housing passes also through said filter body before passing into said metering mechanism.

---

2,770,133
LIQUID LEVEL INDICATING APPARATUS
John C. Stevens, Portland, Oreg., assignor to Leupold & Stevens Instruments, Inc., Portland, Oreg., a corporation of Oregon
Application June 29, 1954, Serial No. 440,066
5 Claims. (Cl. 73—305)

4. A water level indicating apparatus comprising a float, a line connected at one end to said float, reel means connected to the other end of said line, reversible motor means drivingly connected to said reel means, a stationary sheave between said float and said reel means over which said line is trained, a movable roller between said sheave and said reel means under which said line is trained, a pivoted arm supporting said movable roller whereby the weight of said roller and said arm are imposed on said line to deflect the same, switch means associated with said arm and adapted to close one circuit to said reversible motor means in response to movement of said arm in one direction and to close a second reversing circuit to said motor in response to movement of said arm in the opposite direction.

---

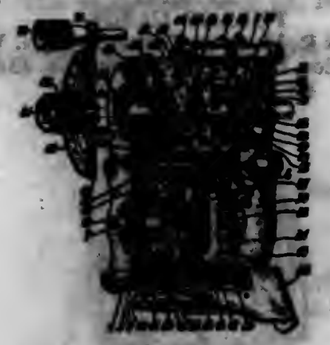


2,770,134
PRESSURE GAUGE
Louis M. Gaigerin, Philadelphia, Pa.
Application May 31, 1955, Serial No. 511,900
9 Claims. (Cl. 73—390)

1. A pressure gauge for measuring and indicating the air pressure of a pneumatic tire comprising, in combination, a casing, means providing a port in said casing for delivering air thereto from said tire, means providing an expansion chamber in said casing and including a first resilient tubular member supported in said casing and having a closed reinforced end portion and an open end portion which is connected with said port for admitting air from said tire to said resilient member, said resilient member being adapted to expand within said casing in response to air pressure, means providing a liquid chamber within said casing and containing therein a viscous liquid having lubricating properties, the space between said casing and the outside walls of said resilient member containing said liquid for lubricating the resilient member, and a second resilient tubular member supported in said casing at one end of said liquid chamber and having a closed end portion which is adjacent one end of said casing and an open end portion for admitting said liquid into the second resilient member in response to the expansion of said first resilient member, the space between said casing and the outside walls of said second resilient member containing said liquid for lubricating said second resilient member and air which is compressed in response to the expansion of said second resilient member until an equilibrium condition is established whereby the expansion of said first resilient member provides an indication of said pressure.

---

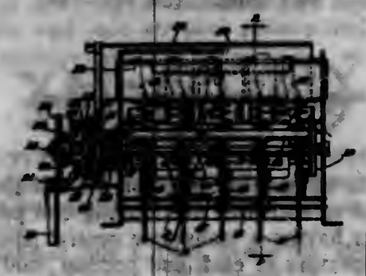
2,770,135
MEASURING AND MIXING SPOON
Winifred B. Purvis, San Antonio, Tex.
Application January 25, 1954, Serial No. 405,678
3 Claims. (Cl. 73—426)



1. A measuring and mixing spoon useful for measuring shortening or the like and mixing said shortening with other ingredients used in cooking, said spoon comprising a bowl having a continuous rim, said bowl having a predetermined volume when leveled off at said rim, said rim having a pair of notches therein and said bowl having an upper surface including a groove extending across said upper surface between said notches, said notches facilitating inserting a scraper blade edgewise into said bowl to bring an edge of said blade into contact with said groove, said blade, when positioned in contact with said notches and said groove, dividing said leveled off volume into two volumes of predetermined volume relation to each other.

---

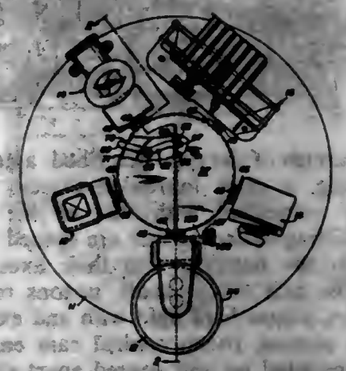
2,770,136
SHAFT POSITIONING MECHANISM
Wilhelmus Lambertus Vervaat, Geesrijn van Gelder, and Godfried Hendrik Waasti, Hilversum, Netherlands, assignors to Hartford National Bank and Trust Company, Hartford, Conn., as trustee
Application April 26, 1952, Serial No. 284,672
Claims priority, application Netherlands May 9, 1951
15 Claims. (Cl. 74—10.3)



1. A shaft positioning mechanism of the locking pawl type comprising a rotatable shaft to be positioned, a plurality of individually adjustable stop elements mounted on said shaft, a plurality of pawl shafts circularly arranged around said rotatable shaft, each of said pawl shafts having a pivotally mounted locking pawl, pawl selector means for each of said pawls in order to enable each of said pawls to co-act individually with a corresponding individual stop element thereby arresting said rotatable shaft in a predetermined position, said pawl selector means comprising a pawl lifter, a pawl arm and a cam member, external means operatively co-acting with said pawls by moving said pawl lifter, pawl arm

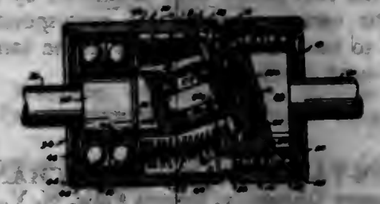
and cam member, said pawl lifter having a certain profile for each pawl so that in one of at least two positions into which said pawl lifter may be moved by said external means all said pawls are maintained in a lifted, inoperative position by said profile, and in the other position any one of said pawls may be moved into operative position in engagement with a corresponding stop element.

---



2,770,137
COUPLING MECHANISM
Leo D. Sacre, Prospect Heights, Ill., assignor to Motorola, Inc., Chicago, Ill., a corporation of Illinois
Application July 25, 1955, Serial No. 524,225
5 Claims. (Cl. 74—10.33)

1. In a selector mechanism for controlling the position of a member and which mechanism includes push buttons for providing predetermined positions of the member and rotary driving means for providing continuous movement of the member from one position to another, means for disengaging said rotary driving means from the member to be positioned in response to operation of a push button including in combination, a first part forming an inner race for a ball structure, a second part forming an outer race for the ball structure, a plurality of balls positioned between said inner and outer races, a third part positioned between said inner and outer races and having retainer portions for receiving said balls therein, two of said parts being individually connected to said rotary driving means and the member to be positioned, and latch means normally engaging the other one of said parts for retaining the same against rotation to thereby provide a driving connection between said two parts through said balls, said latch means being operated in response to the operation of a push button to release said other part and thereby disengage said rotary driving means.

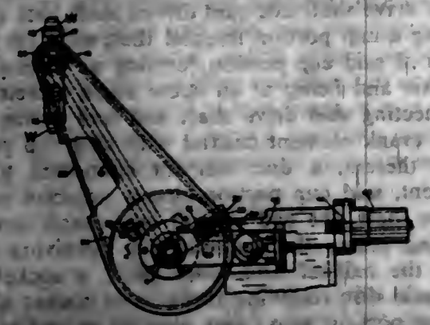


2,770,138
KITCHEN APPLIANCE
Melvin H. Ripple, Canton, Ohio, assignor to The Hoover Company, North Canton, Ohio, a corporation of Ohio
Application July 22, 1954, Serial No. 445,137
8 Claims. (Cl. 74—16)

1. A domestic kitchen device comprising: an electric motor having driving means, a plurality of kitchen appliances, means on each of said appliances adapted to be separately connected with said driving means to operate said appliances, a centrifugally operated switch attached to said motor, and means for each of said appliances connectible with said centrifugal switch to control the operation of the latter.

---

2,770,139
HERMETICALLY SEALED TORQUE TRANSMISSION SYSTEM
Yain C. Shaw, Great Notch, and Harlow D. Adkins, Wertsnlyke, N. J., assignors to the United States of America as represented by the Secretary of the Air Force
Application November 26, 1952, Serial No. 322,642
4 Claims. (Cl. 74—18.1)



1. A high speed sealed torque transmission unit comprising a drive shaft, a driven shaft, and a housing, said shafts rotatably mounted in the housing, means connecting said drive shaft and said driven shaft, one of said shafts having a cup portion integral therewith, the longitudinal axis of said cup portion forming an extension of the shaft axis and being at an acute angle thereto, said means connecting said drive shaft and said driven shaft including a crank element coaxial with said cup portion and seated therein, a disc element connected to said crank element, said cup portion closely adjacent an end of the other shaft, the end of said other shaft having a disc receiving recess therein, said disc receiving recess inclined to the axis of said other shaft, a socket in a surface of said disc receiving recess, said socket aligned with said cup portion, said crank element extending from said cup portion to a seat in said socket, said disc element substantially equal in size to the size of the end of said other shaft and positioned partially in said disc receiving recess making an acute angle with the axis of said other shaft, a frustum shaped bellows substantially coaxial with one of said shafts, one end of said bellows sealed to said disc, the other end of the bellows sealed to said housing to isolate said shafts in separate chambers in the housing, said chambers being fluid tight with respect to each other.

2,770,140
CAM MECHANISM
Vincent E. Schmahe, Cleveland Heights, Ohio
Application November 27, 1953, Serial No. 394,649
9 Claims. (Cl. 74—86)

1. In apparatus of the type described, a generally cylindrical housing, a shaft journaled therein with its axis substantially coincident with that of the housing, the housing including cylinders that are spaced apart circumferentially of the housing with their axes substantially parallel to the axis of the shaft, pistons reciprocable in said cylinders, piston bars rigid with and extending axially from the pistons, frusto conical cam engaging rollers rotatably supported by and spaced apart along each piston bar, a drum cam on the shaft having circumferential undulated cam faces engaged by the spaced rollers of the respective piston bars, the axis of each roller intersecting the axis of the shaft at substantially right angles, and the apex of the projected conical surface of each roller being substantially coincident with the point of intersection of the axis of said roller and shaft, each cam face having a taper complementary to that of the rollers that engage said face, rigid tie means bridging the shaft and reciprocable therealong between the cam and cylinders and secured to opposed piston bars for restraining them against outward radial movement, a device on each of the opposed piston bars located beyond the side of the cam remote from said tie means and disposed within the radius of the drum cam and engaging a circumferential part of the cam for holding the adjacent portion of the piston bar against outward movement, the undulations of the cam faces being at all times identically related to the two piston bars connected by each of the aforesaid tie means whereby the corresponding pistons are caused to move simultaneously in the same direction and at the same speed.

2,770,141
TURN-TABLE TRANSFER MECHANISM
Arthur Sumner Dinsmore, Seneca Falls, N. Y., assignor to Seneca Falls Machine Company, Seneca Falls, N. Y., a corporation of Massachusetts
Application June 16, 1954, Serial No. 437,196
1 Claim. (Cl. 74—99)

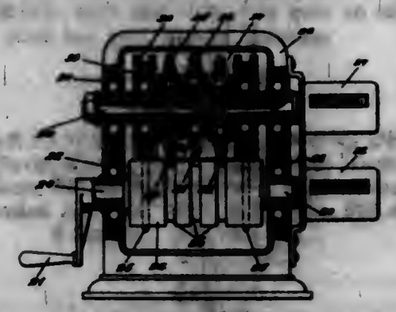
A turntable transfer mechanism comprising a supporting arm, a main shaft on which said arm is secured, a work support pivoted at the swinging end of said arm, a relatively smaller sprocket fixed to said work support and concentric with its pivot, a relatively larger sprocket mounted in fixed position concentric with the axis of said main shaft, a chain connecting said two sprockets, a power arm fixed on said main shaft and having a radial slot, a crank arm having a roll movable in said radial slot, a supporting shaft for said crank arm, a fixed bearing for said supporting shaft, a pinion on said supporting shaft, a rack engaging said pinion, a manually-controlled air-operated cylinder-and-piston operating unit for said rack, and stops to limit swinging movement of said supporting arm in both directions, and said sprocket-and-chain connection being effective to reverse the angular position of the work as the supporting arm is swung 90°.

2,770,142
PULLEY GUIDE
Frank R. Murphy, Chittenango, N. Y.
Application June 3, 1954, Serial No. 434,276
1 Claim. (Cl. 74—240)

In combination, a pulley of the type having a single flange, an attachment comprising an elongated plate having a longitudinal row of openings, and fastening means carried by the pulley and engaged in a selected opening to secure the plate in a radially outwardly extending adjusted position at the periphery of the pulley and spaced from the flange thereof to retain a flexible member on the pulley between the flange and the plate.

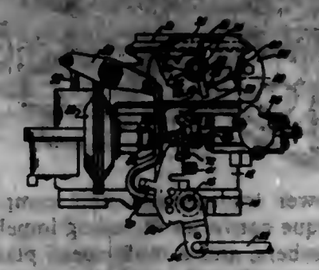
2,770,143
FLEXIBLE LINK CHAIN
Wilfrid H. Bendall, New York, N. Y.
Application February 12, 1951, Serial No. 210,586
10 Claims. (Cl. 74—245)

1. A chain comprising links of flexible sheet material disposed end to end with overlapping end portions, each of said links having a transverse central aperture and a transverse aperture at each end portion, said links being arranged with registering apertures at said end portions and being interconnected by links of like flexible material having transverse flat portions passing through the registering apertures and transverse curved portions passing through adjacent central apertures and engaging the edges of said apertures.

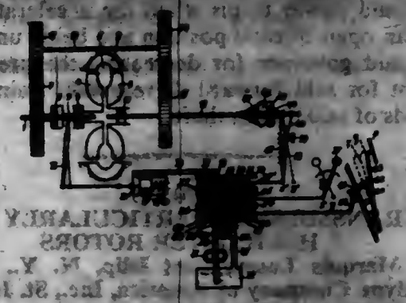


2,770,144
FLEXIBLE LINK CHAIN
Wilfrid H. Bendall, New York, N. Y.
Application June 12, 1952, Serial No. 293,158
14 Claims. (Cl. 74—245)

1. A flexible link chain comprising apertured links of flexible sheet material disposed end to end with overlapping end portions and registering apertures in said end portions, and link interconnecting members of like material having a transversely curved center portion with extensions thereof doubled over said center portion and end portions turned normal thereto passing through said registering apertures.

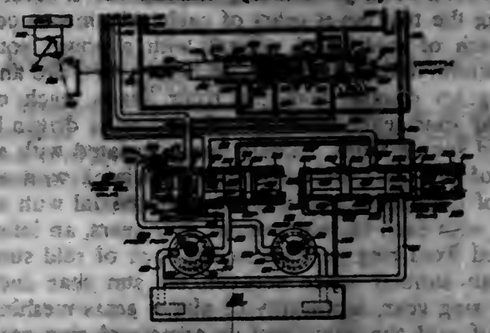


2,770,145
FUNCTION UNIT
George R. Stibitz, Burlington, Vt.
Continuation of application Serial No. 7,982, February 12, 1948. This application April 13, 1954, Serial No. 422,844
28 Claims. (Cl. 74—393)



1. A function unit comprising a rotatable input shaft the amount of movement of which from a fixed reference point represents a real variable, a rotational output shaft the amount of rotation of which from a fixed reference represents a function of said real variable, pattern means bearing a physical pattern having predetermined characteristics arranged along a pattern path, said pattern means having a length much greater than its width or thickness means positively driving said pattern means from said input shaft in the direction of its length so as to impart movement to said pattern upon rotation of said input shaft and means cooperating with said pattern means for means positively driving said output shaft through said physical pattern to thereby vary the number of revolutions of said output shaft from said fixed reference in accordance with said physical pattern and the movement imparted thereto by said input shaft.

2,770,146
AUTOMOTIVE VEHICLE CONTROL MECHANISM
Albert H. Winkler, Elmira, N. Y., assignor to Bendix Aviation Corporation, South Bend, Ind., a corporation of Delaware
Application July 3, 1952, Serial No. 297,842
3 Claims. (Cl. 74—472)

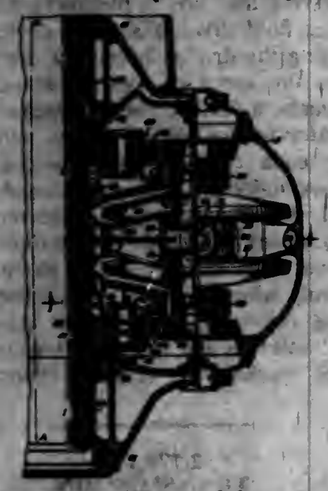


3. A control mechanism for a carburetor having a kickdown switch mounted thereon comprising a choke valve, a choke lever operatively connected to said choke valve, a throttle, a throttle lever operatively connected to said throttle, a control lever rotatably mounted adjacent said throttle lever, abutment means on said control lever adapted to engage said choke lever and switch, and an arm on said throttle lever adapted to move said control lever into engaged position with said choke lever and switch when said throttle is opened a predetermined amount.

2,770,147
METHOD AND DEVICE FOR THE SHIFT CONTROL OF DRIVES, PARTICULARLY OF MOTOR VEHICLE DRIVES WITH A FLUID DRIVE
Friedrich K. H. Nallinger, Stuttgart, Germany, assignor to Daimler-Benz Aktiengesellschaft, Stuttgart-Untertürkheim, Germany
Application April 22, 1950, Serial No. 157,459
Claims priority, application Germany April 29, 1949
7 Claims. (Cl. 74—472)

1. A drive mechanism for a vehicle comprising a driving member, a driven member, a fluid drive arranged between the driving and driven members, a driving branch by-passing the fluid drive, a shifting device for engaging and disengaging the driving branch, a control mechanism responsive to the speed of rotation at one point of the drive mechanism, a further control mechanism actuatable by the operator in the control of the vehicle, a shifting member for each control mechanism, a third control mechanism manually actuatable, a third shifting member, each control member having a predetermined control position, and means actuatable by the three shifting members to influence the shifting device to engage said driving branch only when all three control mechanisms have exceeded the predetermined control position and the shifting mechanism is not engaged if at least one of the three control mechanisms remains below said control position.

2,770,148
TRANSMISSION
Robert W. Waymon, Muncie, Ind., assignor to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois
Application October 2, 1951, Serial No. 249,296
14 Claims. (Cl. 74—472)

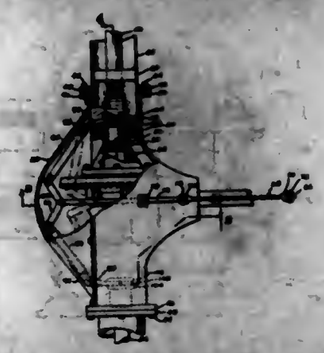


1. In transmission mechanism for an automotive vehicle having a driving engine with a throttle, the combination of a drive shaft, a driven shaft, a hydraulic torque converter driven by said drive shaft, an accelerator for controlling the engine throttle, means for providing a forward drive power train between said torque converter and said driven shaft, means for providing a reverse drive power train between said torque converter and said driven shaft, said two last named means including a planetary gear set having a reaction element and a friction brake for the reaction element for completing both of said power trains when engaged, the reaction on said reaction element for said reverse drive power train being greater than for said forward drive power train and said brake being wrapping or self-energizing for the direction of

reaction on the reaction element for said reverse drive power train and being unwrapping or self-deenergizing for the direction of reaction on the reaction element for said forward drive power train, means for engaging said friction brake with substantially the same pressure for completing both of said power trains, and a governor driven in accordance with the speed of said driven shaft, said brake engaging means being under the control of said accelerator for increasing the pressure of engagement for both of said power trains when the accelerator is moved toward an open throttle position and being under the control of said governor for decreasing the pressure of engagement for said forward drive power train on increasing speeds of said driven shaft.

---

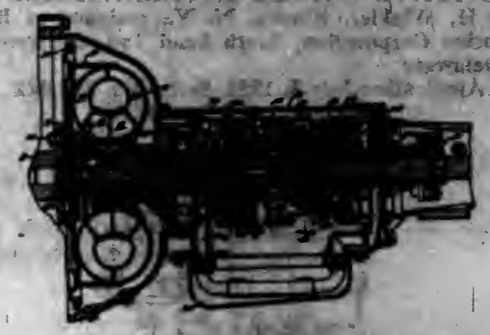
**2,770,149**
**TRANSMISSION, PARTICULARLY FOR HELICOPTER ROTORS**
Arthur Marquis Leavy, East Islip, N. Y., assignor to Gyrodyne Company of America, Inc., St. James, N. Y., a corporation of New York
Application March 9, 1953, Serial No. 341,235
11 Claims. (Cl. 74—665)



1. In a helicopter having coaxial rotors, two coaxial rotor shafts, two pairs of bevel gears disposed on opposite sides of said rotor shafts and rotatable about fixed axes parallel to said rotor shafts, each of said pairs comprising two coaxial bevel gears facing one another, a bevel pinion driving the two bevel gears of each pair, means connecting each of said bevel pinions with a power source, a spur pinion fixed to each of said bevel gears, two annnular spur gears coaxial with the rotor shafts, each of said annular spur gears meshing with and being driven by two of said spur pinions, namely one associated with a bevel gear of one pair and the other associated with a bevel gear of the opposite pair, a sun gear coaxial wtih and rotating with each of said annular spur gears, an internally-toothed fixed ring gear encircling each of said sun gears with an annular space between the sun gear and associated ring gear, a plurality of planet gears meshing with each of said sun gears and its associated ring gear, two carriers each rotatably supporting the planet gears associated with one of said sun gears, said carriers being coaxial with said rotor shafts and means connecting one of said carriers with one rotor shaft and the other of said carriers with the other rotor shaft.

---

**2,770,150**
**FRONT AXLE**
Frank E. Culverwell, Mesquite, Nev.
Application August 7, 1953, Serial No. 373,312
1 Claim. (Cl. 74—710)

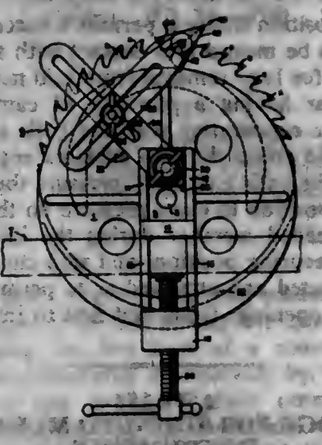


In an automotive vehicle of the four-wheel drive type including a front differential housing having differential gearing therein for driving the front wheels, the improvement residing in the combination of means for preventing rotation of said front differential gearing when said gearing is not drivingly engaged with said front wheels, said means comprising opposed coaxially aligned stub shafts operatively connected at one end to said differential gearing and extending outwardly therefrom, a wheel axle in end-to-end relation with each of said stub shafts, said axle rotatably mounting the front wheels adjacent the end thereof remote from said stub shaft and the end adjacent said stub shaft having external splines, the end of said stub shaft remote from said gearing being externally splined, a drive clutch having internal splines carried

by each of said stub shafts on the splined end thereof for movement longitudinally thereof into and out of operative connection to the adjacent splined end of the wheel axle for operative connection with the latter for transmitting the drive of said gearing to the front wheel; with linkage means carried by and disposed within said housing and operatively connected to said drive clutches, and actuating means carried on the vehicle and operatively connected to said linkage means for selectively simultaneously moving said linkage means and the drive clutch on each of said stub shafts into and out of operative connection with the adjacent wheel axle end.

---

**2,770,151**
**HYDRODYNAMIC TRANSMISSION**
Bert W. Cartwright and William T. Dunn, Detroit, Mich., assignors to Chrysler Corporation, Highland Park, Mich., a corporation of Delaware
Application June 17, 1952, Serial No. 294,034
15 Claims. (Cl. 74—732)



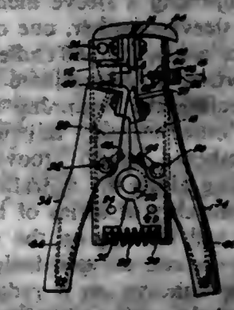
1. A power transmission unit comprising a hydrodynamic torque converter including impeller, turbine and reaction members, and a multi-speed planetary gear box including first and second planetary gear sets and an output shaft, said gear sets each being arranged in series between said converter and said output shaft, said gear box comprising an intermediate shaft connected to the converter turbine member and adapted to transmit drive between the turbine member and the several gear sets, said intermediate shaft mounting a first sun gear of said first gear set and a first annulus gear of said second gear set, a second sun gear for said first gear set, a clutch device connectible between said intermediate shaft and said second sun gear of said first gear set, a first brake means to selectively anchor said second sun gear of said first gear set against rotation, a first set of pinion gearing meshingly engaged with the first and second sun gears of said first gear set, a carrier rotatably supporting said first set of pinion gearing and drivingly connected to said output shaft, a second annulus gear meshingly engaged with the pinion gearing of the first gear set, a second brake means adapted to be applied to said second annulus gear to selectively anchor said second annulus gear against rotation, a second set of pinion gearing rotatably supported by said carrier member and arranged in meshing engagement with the said first annulus gear of the second set of gearing, a third sun gear meshingly engaged with the said second set of pinion gearing, and a third brake means engageable with said third sun gear to selectively anchor said third sun gear against rotation.

---

**2,770,152**
**CIRCULAR SAW BLADE SHARPENING DEVICE**
Elwood R. Davis, Keene, N. H., assignor to Harrington & Richardson, Inc., a corporation of Massachusetts
Application April 19, 1955, Serial No. 502,491
8 Claims. (Cl. 76—36)

1. A saw holding device for sharpening circular saws, comprising a pair of clamping jaws having aligned openings, a stud projecting through said openings on which a circular saw blade may be supported between said jaws, a pivotally mounted arm rotatably on an axis concentric with the saw blade, and a gauge block mounted on said arm, said gauge block having one face in a plane subetantially parallel and closely spaced to the plane in which the front faces of alternate teeth of the blade are to be filed and a second face in a plane subetantially parallel and closely spaced to the plane in which the back faces of said alternate teeth are to be filed.

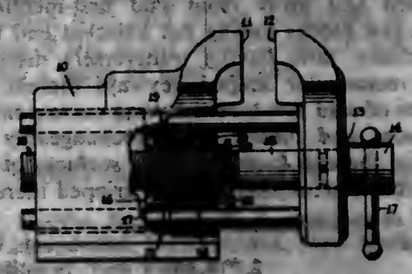
---



**2,770,153**
**KNIFE SHARPENER**
Franch F. Rodossi, San Francisco, Calif.
Application September 27, 1955, Serial No. 537,023
1 Claim. (Cl. 76—89.1)

In a device for forming serrations on the edge of a knife, a base member, a member pivoted to said base and having a portion thereof parallel to said base, a cutting element carried by and suspended from said pivoted member, a spring mounted on said base and supporting the free end of said cutter, a guide rest mounted on said base, said guide having a pair of inwardly inclined bearing surfaces positioned on opposite sides of said cutter, said rest having a slot therethrough to guide said cutter in an up and down movement, and fulcrum means carried by said inclined surfaces whereby a knife may be forced against said cutter.

---



**2,770,154**
**ADJUSTABLE BITE WIRE STRIPPERS**
William G. Schlenke, Sycamore, Ill., assignor to Ideal Industries, Inc., Sycamore, Ill., a corporation of Delaware
Application June 15, 1953, Serial No. 361,689
3 Claims. (Cl. 81—9.5)

1. In a hand tool for stripping insulation from a wire, a pair of opposed jaw carriers pivoted together, a pair of handle members pivotally mounted on the jaw carriers, one of the jaw carriers and its handle member having longitudinally opposed clamping jaws, the other jaw carrier and its handle member having longitudinally opposed stripping jaws, resilient means for biasing the pivoted jaw carriers so that the jaws come together, and a variable abutment between the said other jaw carrier and its handle member and on one of them to regulate the distance that the stripping jaw on the handle member can move toward the stripping jaw on the jaw carrier, said abutment being disposed so as to be effective between the pivot and the stripping jaw on the jaw carrier, said variable abutment being disposed on said other jaw carrier and adapted to engage its handle member, said variable abutment having a stem threaded into said other jaw carrier, and a plastic pin mounted in said other jaw carrier in engagement with the threaded stem so as to prevent accidental movement of the abutment.

---

**2,770,155**
**BALL AND HELICAL RACE FOR MECHANICAL MOVEMENTS**
Porter S. Morgan, Westport, Conn., assignor to Morgan Development Laboratories, Inc., Westport, Conn., a corporation of Delaware
Application July 24, 1952, Serial No. 301,043
22 Claims. (Cl. 81—36)

1. A device comprising a first member and a second member, one of said members being a cylinder and the other being a sleeve surrounding the cylinder, the first member only having on its surface facing the surface of the second member a helically disposed race having a face portion which inclines away from the axis of the second member and is spaced therefrom, the second member having on its surface facing said race a helical

track, a series of spaced balls between the members and rifling in said rifle in the space between the face of the race and the surface of the track on the second member, the inclination of the face of the race and the position thereof relative to the surface of said helical track being such that the balls wedge between said race face and the track surface of the second member in the absence of relative rotation between the members and prevent axial movement between the members in one direction and cause relative axial movement between the members in the other direction as the wedged balls travel in the helically disposed race and track in response to relative rotation between the members.

13. A device comprising a sleeve member and a rod member within the sleeve member, one of said members having on its surface a plurality of endless grooves each having a helical portion of determinate pitch and a reverse portion connecting the beginning and end of the helical portion, the other member having on its surface facing the first member a helical groove of said determinate pitch extending along the operating length of the second member, a plurality of series of balls each series interposed between and bearing on the surfaces of one of said endless grooves and on said helical groove, said helical groove being concave on a radius substantially that of the balls, and the endless grooves each having a wedging face inclined toward the axis of the members between which face and the concave surface of the helical groove the balls wedge and prevent axial movement between the sleeve and the rod in one direction and cause relative axial movement between the members in the other direction as the wedged balls travel in the helically disposed grooves in response to relative rotation between the members, the balls being freed of said wedging action during passage through the reverse portions of said endless grooves.

2,770,156

**AUXILIARY JAWS SELECTIVELY ATTACHABLE TO CONFRONTING AND UPPER SURFACES OF VISE JAWS**

Henry J. Brettinger, Saginaw, Mich.

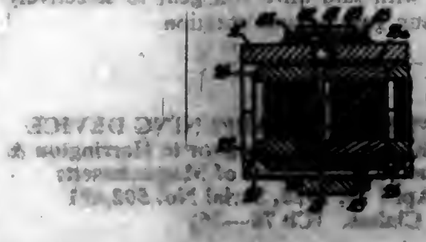
Application July 18, 1955, Serial No. 522,761

4 Claims. (Cl. 81—38)

1. In a vise, a fixed jaw block, a movable block movable toward and away from said first-mentioned jaw block, the jaw blocks having flat adjacent end faces and upper surfaces, jaws having transversely disposed substantially rectangular shaped keyways therein, and the upper faces of said jaw blocks having corresponding keyways therein, and means for interchangeably securing said jaws to the end faces or upper surfaces of said jaw blocks so that a workpiece may be gripped therebetween.

---

2,770,157



**MAGAZINE SOCKET WRENCHES**

Samuel A. Morse, Elmhurst, N. Y.

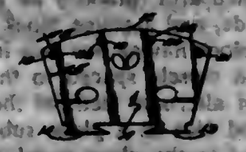
Application May 24, 1954, Serial No. 431,679

2 Claims. (Cl. 81—125)

1. A magazine socket wrench comprising a magazine polygonal in cross section and of a length to contain a plurality of threaded members, each defined by a peripheral polygonal wall said front and rear ends, means at the forward end of said magazine for engaging the front end of a leading threaded member and thus retaining all threaded members therein and arranged to be moved to permit a leading threaded member to be removed therefrom, the walls of said magazine having a plurality of small openings therein spaced about its periphery, said openings being spaced from the first-mentioned means a distance equal to the length of the peripheral wall of a threaded member, the walls of said magazine to the rear of said openings being imperforate, a ball in each of said openings, each movable from a first position where it abuts against the rear end of a leading threaded member and prevents discharge of succeeding threaded members

to a second position where it permits a succeeding threaded member to be moved into contact with said first-mentioned means for later removal from said magazine, and a movable collar having a plurality of cam surfaces on its interior for cooperating with the balls so that in one position of said collar the cam surfaces engage the outer periphery of the balls and apply pressure thereto to maintain them in position to exert pressure on the rear end of a leading threaded member during the initial threading thereof into securing position, and said cam surfaces being so constructed and arranged as to permit the balls to move in said openings from said first to said second positions.

---



2,770,158

**BRIDGE FOR STRINGED MUSICAL INSTRUMENTS**

Reginald M. Bowman, Baltimore, Md.

Application March 27, 1956, Serial No. 574,315

3 Claims. (Cl. 84—309)

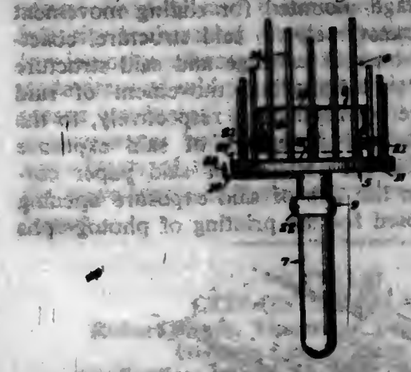
1. A support for the strings of a stringed instrument comprising a bridge having a foot at each end and adjacent the bottom thereof for supporting the bridge upon the instrument, said bridge having a plurality of apertures spaced upwardly from the foot members a predetermined distance across the top portion of the bridge, a grummet surrounding each of the apertures of a material harder than the material of the bridge.

---

2,770,159

**MUSICAL INSTRUMENT**

Shoji Kato, Suzuki-ku, Tokyo, Japan, assignor to National Merchandising Corp., Los Angeles, Calif., a corporation of California



Application January 3, 1956, Serial No. 557,150

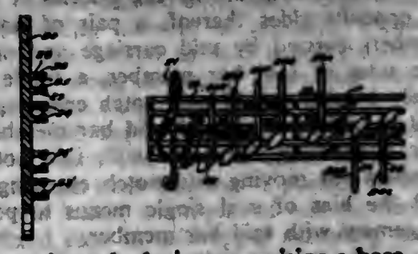
5 Claims. (Cl. 84—404)

1. A musical instrument comprising a base provided with a handle by means of which said base is adapted to be reciprocatively shaken, a complement of differently pitched musical rods carried by the base in circular arrangement, a bridge member rotatably mounted centrally of the musical rods, a pendent clapper attached to each end of said bridge member adjacent to the musical rods

and adapted to strike the same when the instrument is shaken, and means to rotationally adjust the bridge mem-

ber to bring the clappers into selective striking position with said rods.

---



2,770,160

**MUSIC STUDY DEVICE**

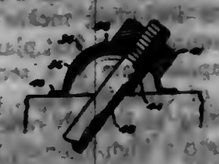
Bernhard Ulrad, North Leominster, Mass.

Application December 15, 1953, Serial No. 398,258

2 Claims. (Cl. 84—470)

1. A music study device comprising a base, a simulated staff fixed thereto, said staff having five spaced horizonal bars representing the five lines of a conventional staff and being cross-connected at intervals by vertical bars, each horizontal bar having a plane outer face, rearwardly converging inner face portions, and rounded longitudinal edges, and a plurality of simulated notes of flexible material adapted to be attached to the staff to indicate various pitches, each note having four pairs of lugs disposed in substantially vertical alignment on the back thereof, each lug terminating in an enlarged head having a rounded surface portion, the rounded head portions of the two lugs of any pair facing each other so that they will pass easily over and clamp on the rounded longitudinal edges of any of the two horizontal bars to which the note is applied, two of said lug-pairs being adapted alternatively to engage two of the horizontal bars upon flexing the note to spring the lugs of the two selected pairs, the two outer pairs of lugs being arranged to engage two of a trio of horizontal bars skipping the intermediate one, the two inner pairs being arranged to engage two successive bars.

---



2,770,161

**SEMI-SPHERICAL COMPENSATING WASHER**

Charles E. Schantz, Grosse Pointe, Mich.

Application September 23, 1954, Serial No. 457,859

3 Claims. (Cl. 85—50)

1. A one piece washer for compensating for angles between the head or nut of a fastener shank and a surface of a member through which the shank extends comprising, a thin sheet metal body of generally semi-spherical shape, a seat along the edge of said body to bear against the surface of the member, a tab sheared out of the body providing a slot to receive the shank in any one of an infinite number of positions along the length of the slot depending upon the angle between the head or nut and the surface of the member, said slot extending substantially from the crown of the semi-spherical body arcuately toward said seat, said tab connected to said body at the end of the slot adjacent said seat and bent inwardly of said semi-spherical body to engage the fastener shank and locate the washer relative thereto, said tab having its end terminating substantially in the plane of said seat and spaced from the center of said body a distance substantially equal to the radius of the shank.

---

2,770,162

**APPARATUS FOR VISUALLY DETECTING SUSPENDED MATTER IN FLUID**

William T. Fleming, West Orange, N. J., assignor to Specialties Development Corporation, Belleville, N. J., a corporation of New Jersey

Application June 5, 1952, Serial No. 291,952

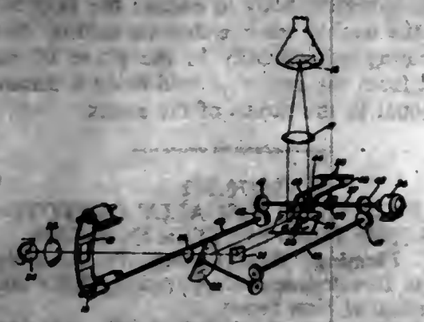
2 Claims. (Cl. 88—14)

2. In apparatus for visually detecting suspended matter in a stream of fluid, the combination of a casing having an opening in the front wall thereof and having a transverse partition dividing the casing into forward and rearward sections formed with a circular aperture in coaxial alignment with the opening, a cylindrical tube extending between the opening and the aperture, and a forward to rearward extending partition depending from said tube to the bottom of said casing and extending between said transverse partition and said casing front wall for dividing the forward section of said casing into a pair of isolated chambers; a window structure in each of said isolated chambers including a rearwardly and upwardly inclined transparent member; means including conduits extending through said transverse partition for circulating a stream of fluid through each of said chambers and adjacent said transparent members; a pair of windows in said transverse partition constructed and arranged to direct a light beam past said transparent members and through the portion of said streams adjacent said members; a pair of reflectors mounted in the rearward section of said casing for directing a light beam through each of said windows; and a unit including a generally tubular housing removably positioned within said tube, a lamp socket carried by said housing element at the inner end thereof, a lamp in operative connection with said socket positioned in the rearward section of said casing adjacent each of said reflectors for directing a beam of light thereon.

---

2,770,163

**NON-INTERMITTENT PROJECTOR FOR MOTION PICTURES**



Charles F. Mattke, Fanwood, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

Application December 19, 1950, Serial No. 201,660

6 Claims. (Cl. 88—16.6)

1. An optical image producing device comprising a first objective lens and a second objective lens, means for directing light rays moving in one coordinate direction through said first lens whereby said moving light rays change their angles of incidence with respect to said first lens in said one coordinate direction, a pair of reflecting

means positioned between said first lens and said second lens for transferring said moving light rays from said first lens to said second lens, each of said reflecting means of said pair oscillatable about a set of pivots whose axes of oscillation are in a single line perpendicular to the plane defined by said light rays moving in said one coordinate direction, further reflecting means positioned between said first objective lens and said pair of reflecting means

for applying said moving light rays from said first lens first to one of the reflecting means of said pair of reflecting means and then to the other, and means for oscillating each one of the reflecting means of said pair of reflecting means about its axis of oscillation to maintain said moving light rays applied to said second lens at a constant angle of incidence in said one coordinate direction.

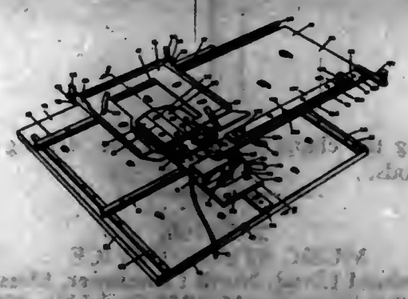
2,770,164
CORRECTION OF THE CONDITION OF STRABISMUS IN HUMAN VISION
Elizabeth P. Olmsted, Buffalo, Richard R. Francis, Tonawanda, and Ira G. Ross, Buffalo, N. Y.
Application March 25, 1952, Serial No. 278,334
5 Claims. (Cl. 88—28)



1. A spectacle lens for reducing the visual acuity of a good eye so as to tend to force the concurrent use and fusion with the poorer eye to alleviate the condition of strabismus in human vision which involves the suppression of the poorer eye and the favoring of the good eye, said lens having the proper refractive correction for the good eye and having on one side and over the full area thereof a diffractive grating of light transmitting and light interrupting areas arranged in a uniform pattern and the light transmitting areas having opposite edge portions spaced apart not less than about 0.001 inch and not more than about 0.015 inch so that light transmitted therethrough is diffracted in at least two different directions to cause the normally sharp outlines of light and dark demarcation of the image to be invaded by fringe band effects of sufficient width to reduce the resolving power of the eye, the closer the spacing within the aforementioned dimensional range the wider the fringe band effect and hence the greater the resolution reduction, whereby the retinal image in the good eye may be made slightly less clear than in the poorer eye.

---

2,770,165
PHOTOGRAPHIC EXPOSURE DEVICE
Arthur D. Vriesslaer, Missouri, Iowa
Application May 13, 1953, Serial No. 354,751
2 Claims. (Cl. 88—24)

1. For use with a photographic printer in the printing of a series of photographs on a single sheet of photographic paper, apparatus for printing rows of side by side pictures on said paper comprising a longitudinally extended base and track structure, a plate member secured in a parallel spaced relation to said base and track structure and having an exposure opening therein of a size corresponding to the size photograph to be printed, a paper carrying carriage mounted for sliding movement longitudinally and transversely on said structure, coacting engaging means on said carriage and said structure limiting transverse or longitudinal movement of said carriage to a distance corresponding, respectively, to the transverse or longitudinal dimension of said exposure opening whereby adjacent sections of said paper corresponding in size to the size of said exposure opening are successively exposed for the printing of photographs

thereon, with one of said coacting means comprising a bar member on said structure having a series of notches formed in opposite sides thereof, a pair of notch engaging members carried by said carriage and arranged on opposite sides of said bar member, a single means for selectively biasing one of said notch engaging members toward the adjacent side of said bar member, and lever means operatively associated with said notch engaging members for moving said notch engaging members against the bias of said single means to positions out of engagement with said bar member.

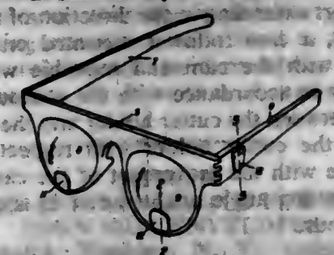
2,770,166
IMPROVEMENTS IN AND RELATING TO OPTICAL APPARATUS FOR PRODUCING MULTIPLE INTERFERENCE PATTERNS
Dennis Gabor, London, England, assignor to National Research Development Corporation, London, England
Application June 30, 1952, Serial No. 296,315
Claims priority, application Great Britain July 6, 1951
13 Claims. (Cl. 88—39)

1. Optical apparatus of the kind with which a specimen can be illuminated by a beam of coherent light and a photographic record can be obtained of an interference pattern produced as a result of the illumination, and for viewing such records with a source of coherent light, the apparatus including means for supporting a specimen to be examined in a first plane, means for supporting a photographic plate in a second plane, means providing a beam of coherent light, a beam-splitter of the partly-transmitting and partly-reflecting type for dividing said beam into a high-intensity background beam and an illuminating beam of relatively low intensity with respect to the background beam, means for directing said illuminating beam onto said specimen, second beam-splitting means receiving the light beam transmitted from said specimen and forming two information-carrying

beams of approximately equal intensity and directing them upon separate portions of said photographic plate, means dividing said background beam into two high-intensity background beams superimposed upon the two low-intensity information-carrying beams within said separate areas of said photographic plate, and phase-shifting means producing a difference of an odd number of quarter-waves between the phase displacements of the wave-fronts of the two background beams relatively to the wave-fronts of their respective information-carrying beams.

---



2,770,167
CLIP-ON SUNGLASSES
Robert Pasnet, Viscennes, France, assignor to Georges Lissac, Paris, France
Application August 12, 1952, Serial No. 304,070
Claims priority, application France August 20, 1951
2 Claims. (Cl. 88—41)

1. A pair of clip-on sunglasses comprising a resilient upper mounting member of generally arcuate shape, a pair of lenses affixed to said upper mounting member substantially along the arc of said upper mounting member, said lenses extending beyond the outer ends respectively of said upper mounting member, an abutment formed on each end of said upper mounting member, said abutments extending over a portion of the outer surface of said lenses, and a pair of resilient clamping members affixed each to said upper mounting member adjacent an end thereof, said clamping members extending from said upper mounting member on the concave side of said arc, downwardly in a direction generally parallel to said lenses, and toward said lenses.

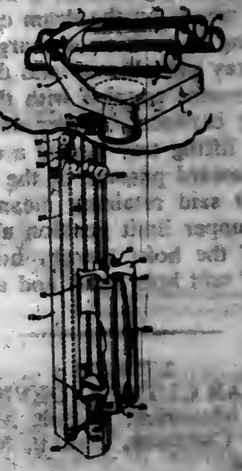
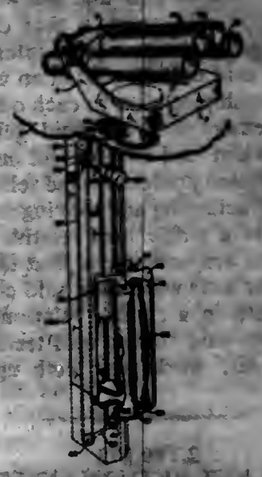
2,770,168
SUPPLEMENTAL LENS-POSITIONING MEANS
Nicholas Tenuro, San Francisco, Calif.
Application October 8, 1953, Serial No. 384,624
2 Claims. (Cl. 88—41)



1. In combination with an eye glass frame having temples secured thereto, socket-like recesses in said frame adjacent lenses mounted in the frame and similar socket-like recesses in said temples, a magnetic element mounted in each of said recesses and a magnetically attractive metal secured to a supplemental lens, said metal on said supplemental lens having a coinciding configuration as said recesses and adapted for selective placement in respective frame and temple recesses.

---

2,770,169
DEPTH-CHARGE LAUNCHER
Sven Gunnar Gerdin, Bofors, Sweden, assignor to Aktiebolaget Bofors, Bofors, Sweden, a Swedish corporation
Application May 27, 1952, Serial No. 290,448
Claims priority, application Sweden November 5, 1951
4 Claims. (Cl. 89—1)



1. A launcher for depth charges comprising a plurality of launching tubes, a support structure fixedly supporting said tubes in a spatial relationship such that the axes of the tubes are parallel to each other and disposed in arcuate arrangement, a frame structure mounted rotatably about an axis perpendicular to the horizontal and supporting said support structure pivotally about a horizontal axis for traversing and elevating said launching tubes, the said tube support structure and the said frame support structure being disposed in a spatial relationship such that the

center of the arc as defined by the tube axes coincides with the rotational center axis of the frame structure in the perpendicular position of the tubes, and a loading mechanism for loading depth charges into said tubes when in perpendicular position, said loading mechanism including a loading station situated in registry with said arc whereby said tubes, when perpendicularly disposed, are rotatable one by one into alignment with said loading station for successively loading said tubes.

---

2,770,170
HOIST FOR PROJECTILES
Erik Albin Fransson, Karlskoga, Sweden, assignor to Aktiebolaget Bofors, Bofors, Sweden, a Swedish corporation
Application May 28, 1952, Serial No. 290,449
Claims priority, application Sweden November 5, 1951
5 Claims. (Cl. 89—46)

1. In a launching assembly for launching depth charges of the class comprising at least one launching tube and a pivot mount mounted upon a platform and mounting the tube thereon pivotal between a perpendicular loading position and a slanted discharge position, the combination with a hoist disposed below the platform and comprising a fixedly mounted perpendicular hoist shaft upwardly protruding through said platform for directly ramming a depth charge into the launching tube when in perpendicular position and aligned with the shaft,

said hoist shaft having a lateral loading opening below said platform, a loading drum below the platform rotatably mounted axially parallel to said shaft and in a spatial relation relative thereto such that in each rotational position of the drum, part of the side wall thereof protrudes into the shaft through said opening, the protruding side wall part of said drum being formed with at least one axial recess extending throughout the length of the drum for inserting therein a depth charge to be loaded, retaining means on the drum extending into said recess for retaining in position a charge inserted in said recess, a lifting tray movable up and down in said hoist shaft, and drive means coupled with the lifting tray for moving the same between a lower and an upper limit position, the said lifting tray having a configuration providing for a downward passage of the same through an empty recess past said retaining means and for lifting the tray into its upper limit position above the level of the upper end of the hoist thereby hoisting the charge completely out of said hoist shaft and into the launching tube.

---

2,770,171

## GEAR CUTTING DEVICE

Alexander D. F. Moncrieff, Detroit, Mich., assignor to Michigan Tool Company, Detroit, Mich., a corporation of Delaware

Application January 29, 1952, Serial No. 268,895
6 Claims. (Cl. 90—1.6)

1. A device for finishing involute gear teeth, including a cutting tool having a plurality of cutting teeth adapted to engage and finish the tooth surfaces of the teeth of a work gear, a master gear, means rigidly interconnecting the master gear with the work gear in a predetermined relationship relative thereto and preventing relative movement between the master gear and the work gear, means rotatably supporting said gears, a gear element meshing with said master gear, means rigidly interconnecting said gear element and said cutting tool in an adjustable a predetermined relationship relative to each other and preventing relative movement between said gear element and said cutting tool when said cutting tool and said gear element are in an adjusted predetermined relationship, means for simultaneously actuating and moving said gear element and cutting tool as a single unit relative to said master gear and work gear respectively so that the meshing gear element and master gear will retain said cutting tool teeth and work gear teeth in a cutting relationship relative to each other, whereby said cutting tool teeth will finish the tooth surfaces of said work gear teeth upon said movement.

---

2,770,172

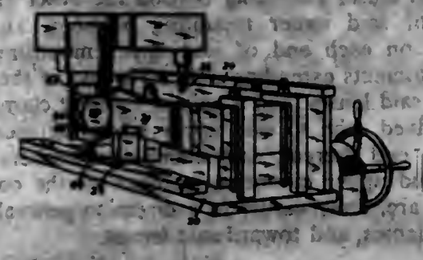
## COOLANT RETURN SYSTEM

Benjamin P. Graves, Providence, R. I., assignor to Brown & Sharpe Mfg. Company, Providence, R. I., a corporation of Rhode Island

Application April 24, 1953, Serial No. 352,233
5 Claims. (Cl. 90—11)

1. In a milling machine having a base, a machine column, and a work supporting assembly including a knee vertically adjustable on the column, and a plurality of supports mounted one on the other for movement in a plurality of directions including a clamp bed mounted for transverse movement on the knee, the combination of a coolant reservoir having a coolant collecting pan thereon in the base, a drainage basin for coolant on the clamp bed, and a telescoping pipe providing an unobstructed passageway between the drainage basin and the

pan, means securing the telescoping pipe for movement as a unit with the clamp bed, and means supported from the base for maintaining the lower end of said pipe spaced above the pan.



---

2,770,173

## MECHANISMS FOR CONTROLLING THE ANGULARITY OF MILLING MACHINE CUTTERS

William Ochse, Uniondale, N. Y., assignor to Liberty Products Corporation, Farmingdale, N. Y., a corporation of New York

Application April 26, 1954, Serial No. 425,354
3 Claims. (Cl. 90—13)

1. In combination, a support, a head movable with respect to said support, a rotary body supported in said head for rotation on a given axis, a cutter holder, means rotatively supporting said cutter holder, on said body, for rotation on an axis at an angle to said given axis, a cutter affixed to the holder, an elongated stationary cam affixed to said support extending in the direction of the movement of said head, a cam follower mounted on said body in engagement with the cam and movable with respect to the said body in accordance with the contour of the cam, and means between the cutter holder and the cam follower for rotating the cutter holder with respect to the body in accordance with the movemeat of the cam follower to change the cutting angle of the cutter in accordance with the cam contour.

---

2,770,174

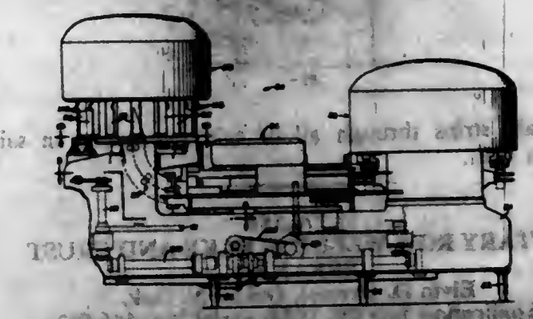
## BROACHING TOOL FOR FORMING TAPERED OPENINGS IN TUBES

Edward B. Hannaffl, Winston-Salem, N. C., assignor to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York

Application November 9, 1953, Serial No. 390,778
3 Claims. (Cl. 90—33)

1. A fixture for cutting a plurality of tapered surfaces on the internal surface of a tube, which comprises a

stationary plate, a block secured fixedly to the plate and having a plurality of surfaces tapered with respect to an axis thereof, a plurality of broaching cutters each of which reciprocates over a corresponding one of the tapered surfaces, means for mounting a tube on the plate so that the cutters may be placed within the tube prior to the broaching thereof, and means for reciprocating the cutters.



---

2,770,175

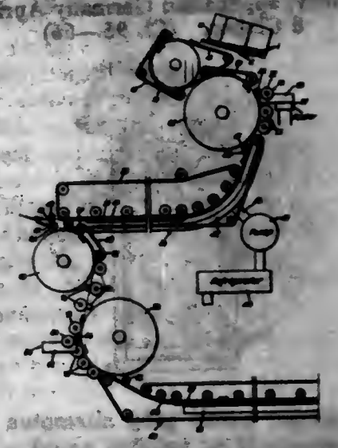
## MACHINE FOR MAKING FLAT-TOPPED PAPER BOTTLES

James F. Earp, Detroit, Mich., assignor to Ex-Cell-O Corporation, Detroit, Mich., a corporation of Michigan

Application November 5, 1952, Serial No. 318,882
12 Claims. (Cl. 93—44.1)

1. In a machine for making cartons from cut and scored blanks of paperboard or the like and having a plurality of side panels and two fractional side panels, a body forming unit comprising, in combination, a machine base, a turret shaft journaled in said base for rotation about an upright axis, a turret head fixed adjacent the upper end portion of said turret shaft for rotation bodily therewith, a plurality of body forming mandrels fixed in circumferentially spaced depending relation on said turret head, a plurality of holders carried by said turret head for holding said blanks against said mandrels, a plurality of seam closers rotatably carried by said turret head and having arcuate portions with openings therein for manipulating the fractional side panels of said blanks about said mandrels and into overlapping seam relation, cam means fixed to said base for actuating said holders and said closers as an incident to movement of said turret head relative to said base, a folder gate assembly, and a bottom flap closing assembly, said folder gate and bottom flap closing assemblies being fixed to said base and disposed for coaction with said mandrels, holders, and closers to complete the formation of carton bodies from said blanks.

---



2,770,176

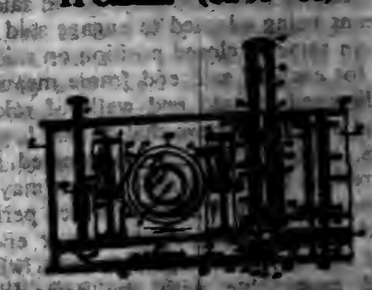
## METHOD AND APPARATUS FOR MAKING OPEN SIDE ENVELOPES

Abraham Novick, Flushing, N. Y., assignor to F. L. Smithe Machine Co., Inc., New York, N. Y., a corporation of New York

Application October 25, 1952, Serial No. 316,921
8 Claims. (Cl. 93—62)

4. In an envelope making machine, in combination, means for gumming and drying fanned-out blanks and conducting them fanned-out in a first band to a turn around station, and mechanism at said station for rearranging the blanks into a second band in which the fanned-out arrangement is reversed and the direction of travel is reversed, comprising a stop toward which the fanned-out blanks of the first band are advanced, a support for the blanks of the first band approaching said stop, spaced from the stop far enough to be nearly cleared by the leading blank of said first band when said blank engages the stop at a pick-up point, a suction arm engageable with the leading margin of the leading blank at the pick-up point to draw it by suction clear of the stop, and means for oscillating the suction arm to impart a first motion to the blank in a direction to continue the previous travel of the leading edge of the leading blank beyond said stop and to pull the leading blank clear of said support, and then to impart a second motion in the opposite direction to thrust the blank to and beyond

the pick-up point to a point of delivery, means for supporting the blanks during and after the action of the arm upon them, and means for conducting the blanks away from the point of delivery in rearranged fanned-out relation at uniform speed and in the direction of said second motion with the bottom flaps leading.



---

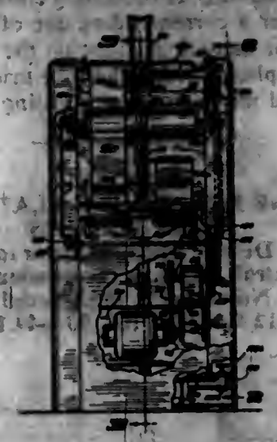
2,770,177

## COMBINED SHUTTER SETTING AND FILM TRANSPORTING MECHANISM

Fritz Faulhaber, Schwabisch (Wurttemberg), Bodo Bobingen, Germany, assignor to Voigtlander, A. G., Braunschweig, Germany, a corporation of Germany

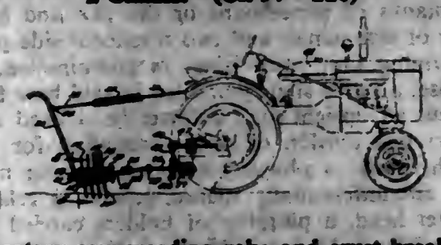
Application December 30, 1953, Serial No. 401,295
11 Claims. (Cl. 95—31)

1. A combined shutter-setting and film-transporting mechanism for photographic cameras comprising a single control member adapted to pass through a wall of said camera, said single control member being reciprocatable between an initial position in which it protrudes from the camera to a final position in which it is substantially wholly disposed within the interior of said camera, a projection provided on the inner end of said single control member, a film pressure plate, lever means disposed in the path of travel of said projection for releasing said film pressure plate during an initial fraction of inward movement of said single control member, a shutter setting mechanism, means disposed in the path of travel of said projection for actuating said shutter setting mechanism during a final fraction of inward movement of said single control member, a film transport mechanism, a rotatable member for actuating said film transport mechanism, a shaft disposed at least partially internally of said single control member, means for rotating said shaft during an intermediate portion of movement of said single control member, a one-way clutch for coupling said rotatable member to said shaft during inward movement of said single control member and spring means for returning said single control member to its initial position.



2,770,178
**HOLDER FOR CARRIERS OF LIGHT SENSITIVE EMULSIONS**
Nikolaus Karpf, Munich, Germany, assignor to Valentin Linhof, Munich, Germany
Application April 11, 1952, Serial No. 281,816
Claims priority, application Germany April 18, 1951
8 Claims. (Cl. 95—66)

1. A holder for light-sensitive carrier means comprising oppositely arranged frame-shaped housings having end walls, open lower ends and a partition common to said housings, oppositely disposed spring-supported walls mounted on opposite faces of said partition, respective dark slide means arranged for movement into said housings and spaced from said spring-supported walls thereof, guide means for the insertion of said carrier means into and for their removal from the lower ends of said housings, said guide means being disposed to extend within said housings adjacent said spring-supported walls, respectively, and for cooperation with the latter, hingedly supported and spring-actuated end frame means for closing said lower ends of said housings and shaped for pressing said carrier means against said spring-supported walls, when said end frame means close on said housings, said slide means being adapted to engage said end frame means to retain same in closed position on said housings, pivot means for each of said end frame means arranged in recesses disposed in said end walls of said housings and positioned at a level above that of said lower ends of said housings, whereby said spring-actuated end frame means upon release from said slide means may be swung about said pivot means to a position which permits ready access to said carrier means in said lower ends of said housings, and ejector means operable from without said housings and engageable with the respective carrier means to displace the later toward and beyond the respective lower housing end.



2,770,179
**APPARATUS FOR PROCESSING STRIPS OF LIGHT-SENSITIVE MATERIAL**
Glen M. Dye, Christian O. Knudsen, and John F. Braden, Minneapolis, Minn., assignors to The Pako Corporation, Minneapolis, Minn., a corporation of Delaware
Application March 19, 1953, Serial No. 158,568
19 Claims. (Cl. 95—94)

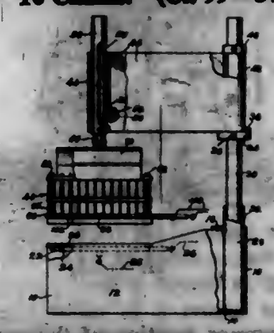
1. An apparatus for processing a pair of strips of light-sensitive material having in combination, a plurality of receptacles adapted to contain liquids, a lower roller in each of said receptacles respectively, upper rollers above said receptacles, an endless leader belt running over said rollers in sequence whereby it moves downwardly and upwardly in each receptacle and traverses all of said receptacles in a sinuous path, said belt having spaced attaching means thereon, a pair of members detachably secured adjacent one of their ends respectively in said means and each having a portion projecting at one side of said belt and having a free end, said members being adapted to engage the forward ends of said pair of strips respectively and lead the same over said upper and lower rollers successively at each side of said belt and thus

lead said strips through all of said receptacles in said sinuous path.

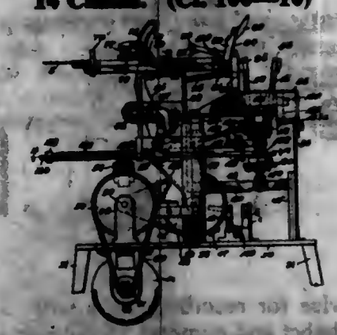
2,770,180
**ROTARY ROW WEEDING RAKE AND CRUST BREAKER**
Elvin D. Dressel, Oakes, N. Dak.
Application July 29, 1954, Serial No. 446,547
2 Claims. (Cl. 97—216)

1. A rotary row weeding rake and crust breaker comprising longitudinally spaced transversely positioned parallel discs rigidly connected with pairs of rods, said rods being inclined to the longitudinal axis of rotation of the discs, bolts removably mounted in the discs spaced from and parallel to the rods, coils with tines extended from one of the ends thereof and loops extended from the opposite ends positioned on the bolts with the loops extended between the rods and with the tines extended radially from the bolts, a stub shaft extending from the disc at the leading end of the unit, and a stud extended from the disc on the trailing end of the unit.

2,770,181
**COFFEE EXTRACTING APPARATUS**
Mortimer J. Kahan, New York, N. Y.
Application January 4, 1952, Serial No. 264,965
3 Claims. (Cl. 99—298)



3. A coffee extractor having a cylindrical housing for coffee and water and a plurality of strainers in units above and below the coffee filling the interior of the housing and slidable therein, and removable girthwise band retainers for packing said strainer units from leakage, the edges of said bands of said retainers being gathered above and below the strainers of a unit of strainers and releasable to permit the strainers and band

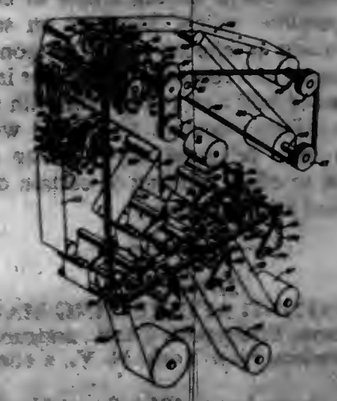


to be cleaned and renewed, having a tubular edge, and draw strings in each edge slidable therein for gathering and snugly drawing each edge of the band as above and below said strainers and for releasing said edges and said retainer, and means for detachably securing the ends of said draw strings.

2,770,182
**ELECTRIC MEAT FRYER**
Weldon H. Jensen, Salt Lake City, Utah, assignor of one-half to William B. Lynch, Cheyenne, Wyo.
Application July 2, 1954, Serial No. 441,044
10 Claims. (Cl. 99—373)

1. An electric meat fryer comprising a substantially horizontal stationary plate, at least one movable plate positioned above the stationary plate and mounted for upward and downward movement relative thereto, a stripping plate suspended beneath the movable plate for upward and downward movement relative thereto, spring means urging the stripping plate downward, said stripping and movable plates having a plurality of aligned pin openings therein, a plurality of pins mounted for upward and downward movement through said pin openings, said pins normally extending below the movable plate with their lower ends positioned above the underside of the stripping plate, spring means urging the pins downward, and electric heating elements connected to a source of electrical energy and positioned to heat the stripping and stationary plates.

2,770,183
**TYING MACHINE**
Harris F. Hanscom, Barrington, R. I., assignor to H. F. Hanscom & Company, Inc., a corporation of Rhode Island
Application November 4, 1955, Serial No. 544,999
14 Claims. (Cl. 100—10)



1. A tying machine comprising a fixed means for supporting the article to be tied, a pair of normally open movable jaws mounted for reciprocation relative to said fixed means, said jaws having means for receiving binding material, means for feeding binding material into said receiving means, means for cutting off a length of the binding material held by said jaws, means reciprocating said jaws away from said fixed means, and means responsive to a predetermined travel of said jaws to rotate said jaws about a common axis thereby twisting the ends of said material.

2,770,184
**BALING MACHINE**
Carlisle F. Smith, Knoxville, Tenn., assignor to J. I. Case Company, Racine, Wis.
Application February 6, 1954, Serial No. 408,691
5 Claims. (Cl. 100—19)

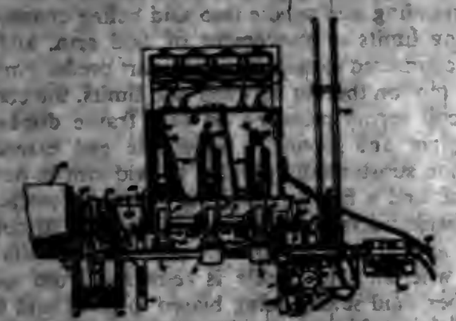
5. In an automatic tying baling machine of the type comprising a frame defining an elongated baling chamber, a needle support arm pivotally mounted on said frame to extend along the side thereof, a needle attached to said arm and arranged to project into said chamber upon predetermined swinging movement of said arm about its pivot for extending said needle into said baling chamber, means defining limits of movement of said arm, and a power drive connected to said arm to impart predetermined oscillating motion thereto between said limits, the combination of a coil spring mounted on said frame displaced from said pivot and having a finger-like end extending in a direction substantially parallel to said arm in one position thereof, and a finger-contacting abutment surface on said arm displaced from said pivot in position to contact said finger as said arm approaches one of said limits of movement wherein said needle is retracted from said baling chamber, said spring being biased to press said finger-like end against said surface with substantial force as said arm continues to a retracted position at said limit of movement, whereby said finger is displaced and the force of said spring tends to check the motion of said arm prior to its reaching said limit of movement to avoid impact and vibratory rebound of said needle into said baling chamber.

2,770,185
**CONTINUOUS FORM FEEDING APPARATUS IN SELECTIVE PRINTING MACHINES**
Arnold B. Crowell, Endicott, and Henry A. Reiffert and Chester V. Mankiewicz, Vestal, N. Y., assignors to International Business Machines Corporation, New York, N. Y., a corporation of New York
Application December 30, 1952, Serial No. 328,758
4 Claims. (Cl. 101—19)

1. In a recording device for printing on an original web, a carbon and a duplicate web, each web being divided into form lengths, a platen over which said webs are drawn, means for printing related groups of impres-

sions on each form length, a pair of feed rollers for line spacing the webs said located above said platen, a supply roll for each web, a pair of feed rollers to draw each web from its respective supply roll and advance it toward said platen while forming a loop between the last mentioned feed rollers and said platen, means to regulate the rate of advance of said webs to said platen including a plurality of contact actuating means operated by a change in size of said loops in related webs, means controlled thereby for separating and closing said feed rollers for drawing each web from its respective supply roll, and punching mechanism for perforating a locating hole at spaced intervals and coordinated with said feed rollers for line spacing to operate between printing on said original web, said punching mechanism including a punch and a clutch operative under control of the printing means after each series of related printing operations to actuate said punch.

---



**2,770,186**

**PLATE SENSING MEANS IN ADDRESS PRINTING MACHINES**

James T. Eberhard, Arlington, Va.

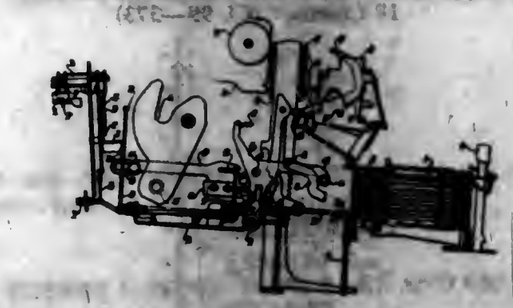
Application June 4, 1953, Serial No. 359,519

20 Claims. (Cl. 101—87)

1. In a printing machine, printing means, means for sequentially moving printing devices through said machine past said printing means, sensing means for controlling the operation of said printing means whereby impressions will be made only from certain of the printing devices, said sensing means being positioned before said printing means in the path of movement of said printing devices through said machine and having a detector determining as each printing device moves past said detector the spatial relation of the indicia carried by such printing device to the leading end of each printing device and selector means connecting said detector to said printing means for selectively determining the certain of the printing devices to be printed in accordance with the indicia carried by each such device, said selector means comprising a connector board having a row of contacts representing the possible indicia locations on said printing devices and contacts to effect printing or non-printing of said printing means, and connecting leads for interconnecting selected ones of said row of contacts with the printing contact or non-printing contact as desired whereby said selector means may be preset by utilizing appropriate connecting leads to effect printing of certain of the printing devices by said printing means.

---

**2,770,187**



**CHECK WRITING ACCOUNTING MACHINE**

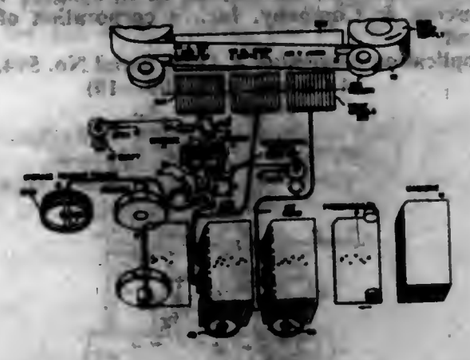
Oscar W. Swanson, Bridgeport, Conn., assignor to Underwood Corporation, New York, N. Y., a corporation of Delaware

Application December 6, 1954, Serial No. 473,426

3 Claims. (Cl. 101—93)

1. In a ten-key accounting machine having a platen carried by a carriage tabulatable to different columnar positions, a plurality of denominational order representing type bars, each type bar having a protective symbol type and a full complement of digit types, said type bars being normally positioned with their protective symbol types aligned with the platen and being differentially operable to align the digit types thereof with the platen, a field of indexable stops for controlling the differential operation of said type bars, a ten-key keyboard for indexing amounts in said field of stops, cycling mechanism for operating said type bars, said cycling mechanism normally moving the type bars representing the uniindexed denominational orders to their "0" positions, means operable in a first columnar position of the carriage to print an amount set up in said field of stops, means operable in said first columnar position to suppress the printing of insignificant "0's", means for retaining the amount set up in said field of stops, means operable in a second columnar position of said carriage for printing the amount set up in said field of stops, means operable in said second columnar position for retaining the type bars representing the unindexed orders in their normal positions with their protective symbol types aligned with the platen, and means operable in said second columnar position for printing protective symbols to the left of the amount.

---



**2,770,188**

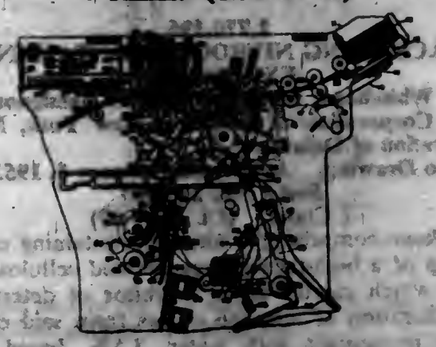
**DICK STRIP PRINTER**

John J. Nolan, St. Albans, N. Y., assignor to International Business Machines Corporation, New York, N. Y., a corporation of New York

Application December 6, 1952, Serial No. 324,563

16 Claims. (Cl. 101—93)

1. In a device for recording on a strip, a plurality of groups of alphabet and numeral printing devices arranged at equal intervals along a common printing line with similar spaces between the groups, means for supporting said strip diagonally across said printing line, means for feeding said strip successively in portions equal to the intervals of spacing of the groups of printing devices and diagonally across them, and means for operating said printing devices between operations of said feeding means to record simultaneously from said plurality of printing devices on a plurality of strip portions and successively on different parts of each strip portion from different printing devices.



**2,770,189**

**CARD INTERPRETING MACHINE FOR DETECTING DOUBLE PUNCHINGS AND BLANK COLUMNS**

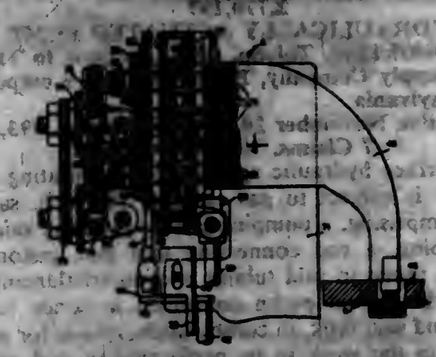
Harold J. Kinnon, Endicott, N. Y., and John C. Veburg, Richmond, Calif., assignors to International Business Machines Corporation, New York, N. Y., a corporation of New York

Application November 14, 1955, Serial No. 546,574

6 Claims. (Cl. 101—93)

1. In a cyclically operable printing machine in which record cards are fed in succession past first and second sensing stations and having means at the first station to sense a columnar order of a record having a series of index point positions in which a value designation is effected in solely one index point position but may have an additional unwanted designation at a second index point position, a type carrier, means for positioning said carrier once during a machine cycle, supplemental sensing means at the second station to sense said index positions for a value designation after such designation has been sensed by the first sensing means, a relay comprising two oppositely wound coils, means responsive to the sensing of a designation by the first sensing means to cause said positioning means to position said carrier, means under control of said positioning means to effect energization of one coil of said relay, circuit means under control of said supplemental sensing means to effect energization of the other coil of said relay in response to the sensing of the first designation by said supplemental sensing means at the time said one relay coil is energized, whereby energization of both relay coils causes said relay to be ineffective, said other coil being again energized upon the sensing of a second designation by said supplemental sensing means to activate said relay, and means under control of said relay when activated to indicate an error.

---



**2,770,190**

**WIRE PRINTING MECHANISM**

Thomas E. Arden, Candlewood Island, Conn., assignor to International Business Machines Corporation, New York, N. Y., a corporation of New York

Application November 4, 1952, Serial No. 318,581

5 Claims. (Cl. 101—93)

1. Printing mechanism comprising in combination, a multiplicity of printing elements, a cylindrical member for each element, each member having a projection extending outwardly therefrom, a pair of guides in which each member is slidably supported, means for connecting each member to its related element, actuating means for engaging the members, means for moving said actuating means from an inactive to an active position, whereby selected ones of said members are engaged to move the related printing elements to a marking position, and a plate positioned between said guides for cooperating with the projection of each engaged member to restore each member when the actuating means is again moved to an inactive position.

---

**2,770,191**

**SQUEEGEE AND FRAME MOUNTING FOR STENCIL PRINTING MACHINES**

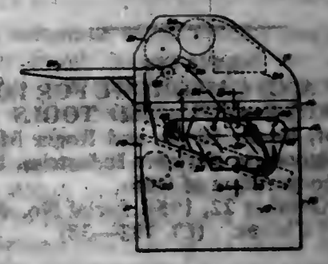
Stanley C. Holly, Mariemont, Ohio, assignor to Cincinnati Screen Process Supplies Inc., Cincinnati, Ohio, a corporation of Ohio

Application August 24, 1953, Serial No. 376,143

4 Claims. (Cl. 101—126)

1. A squeegee and frame structure for screen printing machines wherein a screen frame is hingedly mounted on a printing table, comprising a single cylindrical rail extending between standards at the rear of said table, a counterweighted squeegee bar having a carriage arranged to ride on said single rail and rockable thereabout, a pair of bell-crank levers pivotally mounted on said rail and each having one leg extending downwardly and normally resting on said table and another leg extending upwardly, a bar connecting the said other legs, said squeegee bar carrying an abutment arranged to abut said bar upon upward movement of said squeegee bar but out of contact therewith in the operating position of said squeegee bar, and a connection between the said other legs and the free edge of said frame, whereby after a degree of upward movement of said squeegee bar, said screen is raised from said table upon further upward movement of said squeegee bar.

---



**2,770,192**

**SHEET RECEIVING TRAY FOR ROTARY PRINTING MACHINE**

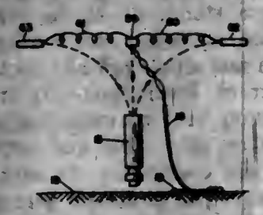
Lester F. Mitchell, Shaker Heights, and Edward J. Janke, Cleveland, Ohio, assignors to Addressograph-Multigraph Corporation, Cleveland, Ohio, a corporation of Delaware

Application June 26, 1953, Serial No. 364,226

7 Claims. (Cl. 101—240)

1. In a duplicating machine, a vertically extending rectangular housing including a pair of spaced side walls, a front wall and a rear wall, a rotary printing couple journaled in the upper portion of said housing with their axes extending horizontally and transversely relative to said housing, a sheet feed table secured to said housing and extending forward from the front wall thereof and across which sheets may be fed to said printing couple,

one of said side walls having an enlarged opening extending therethrough, a sheet receiving receptacle carried by said housing and movable into and out of sheet receiving position in said housing through said opening, means within said housing to divert freshly printed sheets from the printing couple into said receptacle, said receptacle having a planar sheet receiving surface, means to removably support said receptacle with said surface sloping downward from front to rear and downward from a point adjacent one side of the housing toward the side of said housing having the opening extending therethrough whereby one corner of the leading edge of a sheet being discharged by said printing couple will strike said surface before other portions of such sheet, an upstanding abutment carried by said receptacle adjacent the rear housing wall and a second upstanding abutment carried by the receptacle adjacent the housing wall having the opening extending therethrough, each of said abutments extending at an acute angle in a counterclockwise direction from the corner of the housing formed at the junction of said adjacent walls.



---

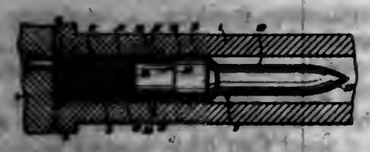
2,770,193

## SEISMIC WAVE GENERATION

Joseph D. Elsler, Tulsa, Okla., assignor to Stanolind Oil and Gas Company, Tulsa, Okla., a corporation of Delaware

Application February 1, 1952, Serial No. 269,500
7 Claims. (Cl. 102—23)

1. In the method of generating seismic waves by detonating a pattern of explosive charges in the air, the improvement comprising propelling a plurality of explosive charges simultaneously upwardly into the air and radially outwardly from a given center point, simultaneously propelling a detonating charge substantially vertically into the air, paying out a detonating fuse connection from each of said charges to said detonating charge as said charges move radially outwardly therefrom, maintaining an electrical detonating connection between said detonating charge and an actuating circuit as said detonating charge rises in the air, and detonating said detonating charge through said electrical connection whereby the detonating fuse connections from said charge to each of said plurality of charges are actuated to detonate all of said plurality of charges substantially simultaneously at a desired pattern position in the air.



---

2,770,194

## METHOD OF AND CARTRIDGE FOR LOADING POWDER-ACTUATED TOOLS

Rowland J. Kopf, Rocky River, and Roger Marsh, Hudson, Ohio, assignors to Portable Industries, Inc., Cleveland, Ohio, a corporation of Ohio

Application October 22, 1954, Serial No. 464,024
3 Claims. (Cl. 102—38)

3. A cartridge for powder-actuated tools comprising an open-mouth case, a charge of propellant contained within said case, charge-confining wad means located forwardly of said charge but rearwardly of said open mouth, the wall of the case having at least one weakened section spaced forwardly of said wad means and rearwardly of said mouth, which is bendable inwardly for engagement with the base of the fastener to be seated therein, said weakened section being defined by a U-shaped cut.

---

2,770,195

## PACKAGING NITROGEN-CONTAINING EXPLOSIVES

William Whitehead, Forest Hills, N. Y., assignor to Celanese Corporation of America, New York, N. Y., a corporation of Delaware

No Drawing. Application January 8, 1952, Serial No. 265,529
1 Claim. (Cl. 102—97)

A package comprising a nitrogen-containing explosive in a wrap of a high-tenacity regenerated cellulose textile material which carries as an inhibitor of deterioration, due to liberation of nitrogen oxides from said explosive and due to contact with water, 3.5%, based on the weight of the textile material, of diphenyl ethylene diamine.

2,770,196

## ELECTROMAGNETIC INTERACTION PUMP

Dudley Albert Watt, Oxford, England, assignor to United Kingdom Atomic Energy Authority, London, England

Application October 5, 1955, Serial No. 384,090
7 Claims. (Cl. 103—1)

1. A single phase electromagnetic pump for pumping liquid metals comprising a closed primary iron circuit having a radially laminated part, at least one primary winding for said primary iron circuit, a duct of curved section around a length of said radially laminated part arranged to conduct liquid metal in a direction along that part, a partial secondary iron circuit comprising bridge members providing further radial laminations having one end in low reluctance contact with said radially laminated part and the other end forming a pole piece around said duct and means for feeding liquid metal into and away from said duct.

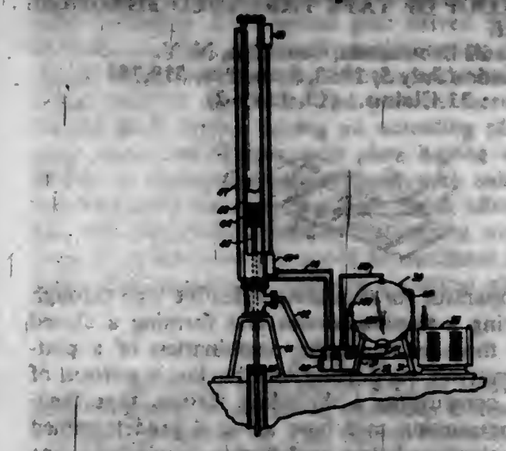
2,770,197



## HYDRAULICALLY ACTUATED PUMP

Roy H. Dettrichson, Toledo, Ohio, assignor to The National Supply Company, Pittsburgh, Pa., a corporation of Pennsylvania

Application November 26, 1953, Serial No. 393,330
7 Claims. (Cl. 103—45)

1. In surface hydraulic apparatus for operating a well pump that is subject to gas entering the well, said apparatus comprising, a pumping jack, a piston in said jack, a well tubing, a rod connecting said jack piston to a production pump in said tubing, a counterbalancing tank and a working fluid pump connected in series between said jack and said tank, in combination, means for sensing variations in the work to be performed in said working fluid pump, and means controlled by said sensing means for interposing a pressure drop between said jack and said working fluid pump during a down stroke and between said counterbalancing tank and said working fluid pump during an up stroke, in accordance with decreases in the differential between pressures in said jack and in said tank caused by the action of such gas on the production fluid column in said tubing.

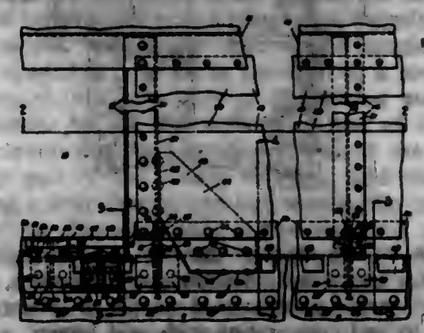
## LADING STRAP ANCHORS

Harry Blomberg, Cleveland, Ohio, assignor to The Youngstown Steel Door Company, Cleveland, Ohio, a corporation of Ohio

Application June 8, 1951, Serial No. 230,585
5 Claims. (Cl. 105—369)

5. A post for the side walls of railway freight cars, said post comprising a flange presenting an edge, said flange being provided with vertically spaced recesses extending into said flange from said edge, U-shaped lading strap anchors, each of said anchors having legs and a vertically arranged bight, said legs being disposed in said recesses in alinement with said flange, said bight being spaced from the adjacent portion of said flange, and welding material securing said legs to said flange.



---

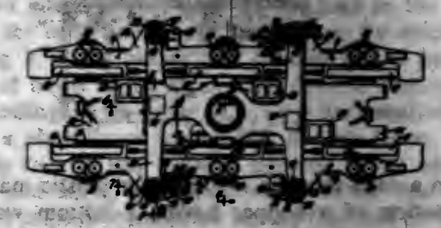
2,770,199

## SIDES FOR RAILWAY FREIGHT CARS

Gabriel Maitland, Chicago, Ill., assignor to The Youngstown Steel Door Company, Cleveland, Ohio, a corporation of Ohio

Application December 15, 1952, Serial No. 325,977
7 Claims. (Cl. 105—409)

1. A replacement carside unit for railway freight cars adapted to be secured to a side sill of a said car comprising a metallic side plate, metallic intermediate and door posts adapted to be disposed outwardly of the side sill, means securing the upper ends of said posts to said side plate, metallic sheathing secured to said side plate and said posts, a longitudinally continuous metallic extension member having an upstanding flange secured to said posts and sheathing, a downwardly and inwardly sloping web and a depending flange adapted to be secured to the side sill, and metallic brackets secured to said posts and adapted to be secured to the side sill for fastening said posts directly to the side sill, said brackets being secured to said web.



---

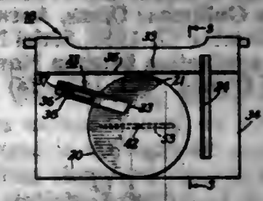
2,770,200

## RAILWAY VEHICLE TRUCK

Richard M. Dilworth and Joseph P. Miller, Hinsdale, Ill., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application December 29, 1952, Serial No. 328,378
8 Claims. (Cl. 105—192)

7. A locomotive truck comprising a truck frame having supporting rotatable wheels and axles attached thereto, said frame including a pair of longitudinally extending side frame members outwardly of said wheels, a bolster, lateral outwardly extending supporting means rigidly fixed on said members, said supporting means having resilient means supported directly thereon which support said bolster on said frame outwardly of said side frame members to stabilize said bolster with respect to said frame, and means on said outwardly extending means engaging said bolster outwardly of said side frame members to transmit longitudinal movement of said frame to said bolster.



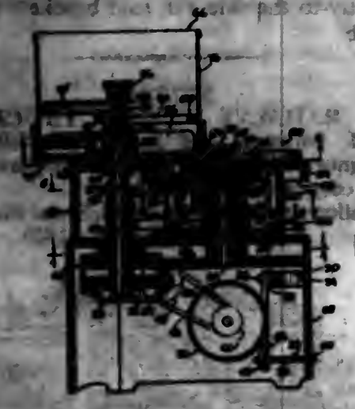
---

2,770,201

## DOUGH HANDLING AND WORKING

William E. Lanham, Atlanta, Ga.

Application September 5, 1952, Serial No. 307,957
4 Claims. (Cl. 107—12)



1. In an automatic bread making machine of the type wherein the dough is mixed and cut into pieces and sheeted and is then rolled into cylindrical loaf like shapes for baking, an assembly disposed along the path of travel of the dough sheet between the sheeter and the rolling operation comprising, a base plate positioned along the path of the dough and downwardly inclined whereby the dough tends to slide therealong, a rotatable disc adjustably mounted thereon and having its upper surface in alignment with the upper surface of said base plate, said disc being freely pivoted upon an axis out of alignment with the center of dough pieces passing along the base plate, a movable hook adjustably mounted on said plate adjacent said disc and having a dough engaging portion positioned to intercept the edge of dough pieces passing downwardly onto the edge of said disk, with the line of engagement being on the same side of the center of the dough piece as the axis of said disc, said disc and hook being movable

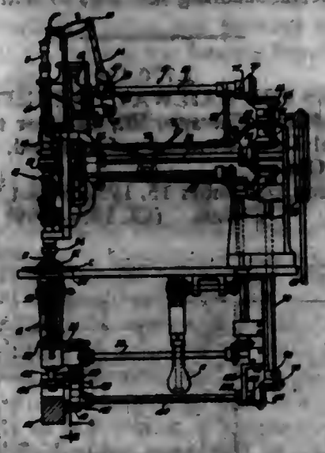
relative to each other and to said plate, and a fixed guide mounted on said plate and adapted to ensure that at least a portion of the dough piece is engaged by said disc.

---

2,770,203
**MACHINE FOR MOULDING PLASTIC MATERIALS**
Louis X. Cardinahl, New York, N. Y.
Application November 14, 1952, Serial No. 320,450
16 Claims. (Cl. 107—15)

7. In a cake-forming machine for plastic material, the combination of a hopper having a bottom wall with a feed opening therein, a vertical drive shaft extending through said bottom wall, a feed means in said hopper, said feed means constituting a multi-bladed member immediately above the feed opening, said member having a downwardly facing well therein, said member being slidable on and rotatable with the drive shaft, said well having a diameter in excess of the diameter of said drive shaft, whereby a space is provided between the well and the shaft, and means to vary the height of the feed means above the feed opening, said means constituting a sleeve adjustably secured directly on the shaft beneath the feed means, the top of the sleeve extending into the well and the bottom of the well resting on said sleeve, whereby adjustment of the position of the sleeve on the shaft will vary the height of the feed means above the opening.

---

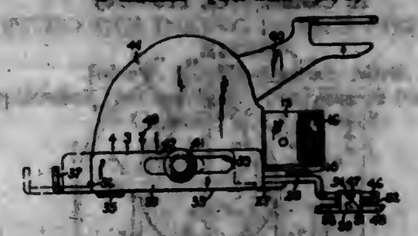


2,770,204
**METHOD AND APPARATUS FOR FORMING A CLOSED LOOP OF TAPE THREADED THROUGH A BUCKLE**
Louis Brownstein, Brooklyn, N. Y.
Application July 5, 1955, Serial No. 519,785
21 Claims. (Cl. 112—2)

9. In an apparatus for threading a flexible tape through a buckle having a transverse slot and forming a closed loop of said threaded tape, the combination of a platform for operatively supporting said buckle, a portion of the platform constituting a threading station, tape feeding means for moving said tape along a predetermined line of feed extending below said station, a movable tape pusher blade normally in an operatively retracted limiting position below said station and below said transverse slot of said buckle when operatively disposed on the station, and positioned for movement upwardly through said slot into an operatively raised limiting position, thereby to push a section of said tape upwardly through said slot, means to actuate said pusher blade between its said limiting positions, a sewing machine adjacent the said platform at a region forwardly of said threading station, buckle actuating means for operatively moving buckles on said platform forwardly along a path of travel from said threading station to the region of said sewing machine, and folding means above said platform and disposed between said threading station and said sewing machine region, said folding means having a portion thereof positioned operatively to engage said tape section when extending upwardly through said slot, said sewing machine being disposed laterally with respect to said buckle path of travel along said platform.

---

2,770,205
**UNIVERSAL TUFTING MACHINES**
Thomas J. Stothard, Jr., New York, N. Y., assignor to Simplex & Sun Curtain Corp., New York, N. Y., a corporation of New York
Original application August 9, 1951, Serial No. 241,897, now Patent No. 2,694,994, dated November 30, 1954. Divided and this application November 17, 1953, Serial No. 393,634
2 Claims. (Cl. 112—79)



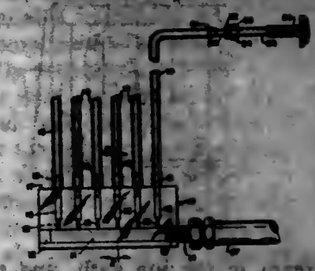
1. In a tufting machine having a cloth feeding foot, a nipple for temporarily holding down the cloth, a needle, means delivering yarn to said needle, a looper, a knife adjacent to and cooperating with said looper, a constant speed drive for actuating said cloth feeding foot, nipple, needle, looper, and knife; means for oscillating said looper

and knife in a vertical plane, said means comprising a main drive shaft, first vertically extending shaft means gear driven from said main drive shaft, second horizontally extending shaft means gear driven from said first shaft means, and a vertically reciprocating shaft laterally spaced from said first shaft means and having a shifting collar fixed to the lower end portion thereof, and said second shaft means having an actuating plate mechanically connected thereto, said plate having a lateral projection in cooperative engagement with said collar, and said vertically reciprocating shaft being effective to oscillate said looper and knife so that on the rotation of said main drive shaft said plate will be oscillated thereby oscillating said looper and knife in a vertical plane.

---

2,770,206
**SEWING MACHINE ATTACHMENT**
Carl G. Beahn, West Haven, and John Connors, Hamden, Conn., assignors to The Geiger Manufacturing Company, New Haven, Conn., a corporation of Connecticut
Application June 9, 1949, Serial No. 97,943
1 Claim. (Cl. 112—239)

A decorative-stitch attachment for a sewing machine comprising a frame member, a lever pivoted to the frame member and having a forwardly extending end portion, said portion being provided with laterally extending trunnions, one upon each side thereof, a presser foot having an upstanding lug at each side edge thereof, each lug being provided with an upwardly facing recess within which one of said trunnions is received, and spring members secured to the presser foot and extending over said trunnions to hold the latter in said recesses and releasably secure the presser foot to the lever.



---

2,770,207
**DEVICE FOR FASTENING THE STITCH PLATE ON THE LOWER PART OF A SEWING MACHINE**
Otto Hess, Ludwigsburg, Wurttemberg, Germany
Application February 24, 1950, Serial No. 330,440
3 Claims. (Cl. 112—260)

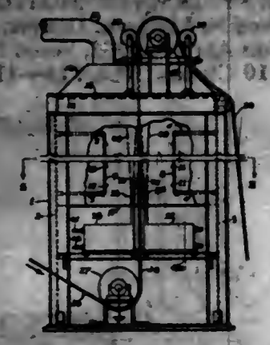
1. In a high speed sewing machine an elongated stitch plate on the lower part of the sewing machine and having oppositely disposed chamfered edges and openings in two opposite ends, one of said ends being the operator's side and the opposite end being at the rear of the sewing machine, and both of said ends having edges chamfered from the top to the bottom, the said second-mentioned end with its chamfered edge being provided in a corresponding groove in the lower part of the sewing machine, a claw member for the first-mentioned end of the stitch plate to secure the first-mentioned end of the plate to the lower part of the sewing machine, said claw member having a hole therein and overlapping the chamfered section of the first-mentioned end of the stitch plate and being separately fixed to the lower part of the sewing machine, and a screw provided in the lower part of the sewing machine to secure the plate to the sewing machine, said screw freely passing through the hole in the claw and having a collar near its head bearing against the claw.

2,770,208
**APPARATUS FOR OBSERVING FUEL IN FUEL PRESSURE SYSTEMS OF MOTOR VEHICLES**
Alfred N. McGurk, Denver, Colo.
Application April 8, 1955, Serial No. 499,390
10 Claims. (Cl. 116—117)

1. Apparatus for attachment to a motor for observing fuel in the fuel pressure systems of motor vehicles and the like while the fuel is passing to the fuel tank of the motor, comprising a portable transparent manifold block, a manifold passageway closed at one end in the block, means in the open end of the passageway for detachably connecting it to the return fuel conduit of the motor, a plurality of bores in the block each open at one end and communicating at its other end with the manifold passageway, a plurality of transparent flexible tubes, means connecting each of said tubes at one end to the open end of one of said bores, the opposite ends of the tubes being free, and a connector mounted on the free end of each of said transparent tubes for detachably connecting it to the return fuel line of the motor.

---

2,770,209
**INDICATING DEVICE**
William L. Nielsen, East Paterson, N. J., assignor to Wilpot Tool & Manufacturing Co., Kearny, N. J., a corporation of New Jersey
Application February 21, 1956, Serial No. 566,965
6 Claims. (Cl. 116—136)

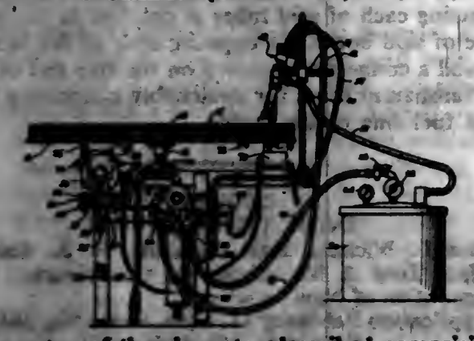


1. An indicating device comprising a flat body member, such body member being provided with a recessed panel in the one surface thereof; an indicia bearing card removably engaged in the recessed panel; a plurality of openings extending along one edge of the body member in registry with the indicia; a strip of flexible material extending laterally from such edge of the body member, adjacent each opening; and a plug extending outward from one face of each strip adapted to be removably inserted in the adjacent opening.

---

2,770,210
**APPARATUS FOR COATING**
Emery P. Miller, Williams Creek, Ind., assignor, by direct and mesne assignments, to Ransburg Electro-Coating Corp., Indianapolis, Ind., a corporation of Indiana
Application November 5, 1948, Serial No. 626,631
7 Claims. (Cl. 118—7)

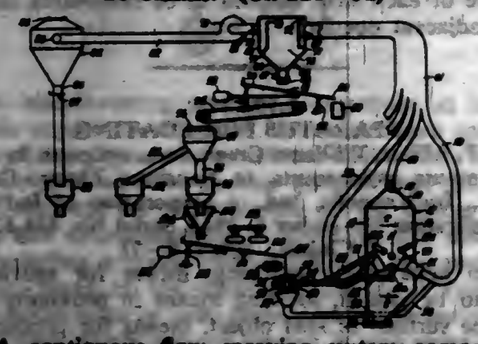
1. An apparatus comprising, means for moving an object to be coated, ionizing means in proximity to at least one surface of said object, means for producing a dispersion of liquid particles in a gas stream, a conduit for introducing a stream of dispersed particles between



said object and ionizing means, said conduit terminating in the ion path between the ionizing means and object to

release said stream in the ion path, and means coordinating the rate of flow of said stream of dispersed particles with the speed of said object.

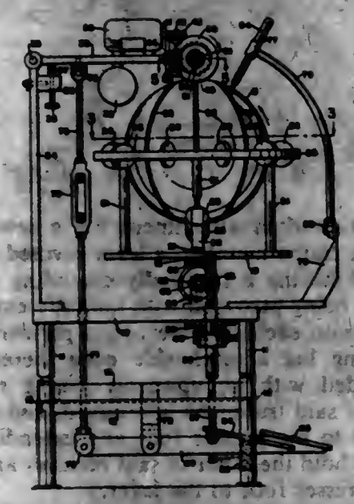
---



2,770,211
GLUE APPLYING APPARATUS
George W. Gustafson, Hoquiam, Wash., assignor to Lamb-Grays Harbor Co., Inc., Hoquiam, Wash., a corporation of Washington
Application August 20, 1954, Serial No. 451,131
3 Claims. (Cl. 118—11)

1. Apparatus of the character described comprising, a turntable for supporting paper heads thereon, a spray gun mounted in spaced relation to the turntable for applying glue to a paper head, an electric motor for rotating said turntable, a valve for controlling said spray gun, and an electric circuit for controlling said motor and said valve, said circuit including a switch for energizing said motor and a switch for actuating said valve, means on the turntable for actuating the valve switch in response to a predetermined position of the turntable, and said valve switch including mechanism for de-energizing said motor after every other actuation of the valve switch.

---

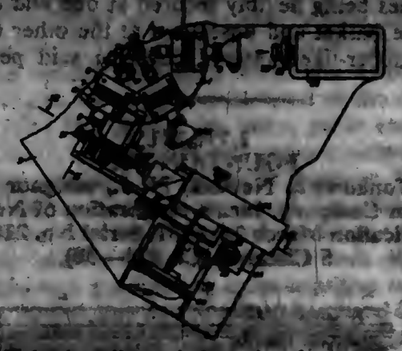


2,770,212
CONTINUOUS FLOW SPRAYING SYSTEM
Israel H. Maranzo, Forest Hills, N. Y., assignor to Columbia Cable & Electric Corporation, a corporation of New York
Application March 26, 1952, Serial No. 278,553
10 Claims. (Cl. 118—31)

1. A continuous flow spraying system comprising a powder distributor having a plurality of inlets on the top surface thereof and a plurality of outlets associated respectively with said inlets, powder supply means having an outlet above the level of the top surface of said distributor and laterally spaced therefrom, an inclined table having its inlet end beneath the outlet of said powder supply means and its discharge end above the inlets of said distributor, means to vibrate said table to distribute the powder fed thereon over the surface of the latter, whereby said powder will flow down the inclined table into the inlets of said distributor, a plurality of spray means connected respectively to each of the outlets of the distributor, means to force powder from said distributor to said spray means for discharge therefrom, suction means to collect excess powder discharged from said spray means, and means to feed such excess powder back to said powder supply means.

---

2,770,213
BALL STRIPING APPARATUS
Paul Rolstyr, Akron, Ohio, assignor to The Sun Rubber Company, Barberton, Ohio, a corporation of Ohio
Application July 27, 1955, Serial No. 524,759
12 Claims. (Cl. 118—76)



1. Ball striping apparatus including a base, a turntable rotatably supported on a vertical axis on the base, said turntable having a frame mounting radially disposed rollers for contacting the horizontal circumference of a ball within the frame, driving means for conducting said ball to rotate it around a horizontal diameter thereof, arcuately arranged rollers in the vertical plane of said horizontal diameter for supporting said ball on said base, means for rotating the turntable in either direction on said base, and means on said base for holding the end of a marking implement against the outer surface of said ball under constant predetermined pressure.

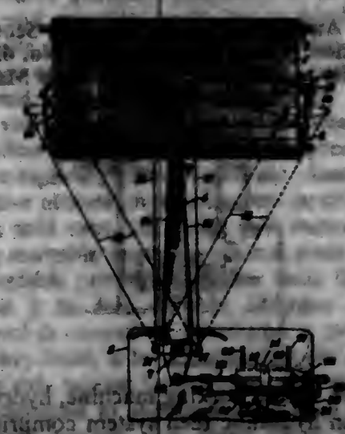
---

2,770,214
CUP HANDLE STROKING MACHINE
George E. Rychman, East Liverpool, Ohio, assignor to The Homer Laughlin China Company, Newell, W. Va., a corporation of Delaware
Application October 31, 1955, Serial No. 543,674
11 Claims. (Cl. 118—242)

1. A cup handle stroking machine comprising a housing, a sleeve mounted in the housing and projecting laterally therefrom, means for oscillating the sleeve on its axis, an arm extending away from the outer end of the sleeve at an oblique angle, means pivotally connecting the arm and sleeve on a transverse axis, a control rod slidably mounted in the sleeve and projecting from its opposite ends, means in the housing for reciprocating the rod, means operatively connecting the outer end of the rod with the arm for swinging the arm on said transverse axis, an applicator mounted on the outer end of the arm,

said applicator for supporting a cup having the applicator with its handle pointed toward the applicator, a crowder of the arm, whereby the arm can swing the applicator into contact with the handle and then the sleeve can swing the arm to cause the applicator to roll along the handle to paint a stroke on it.

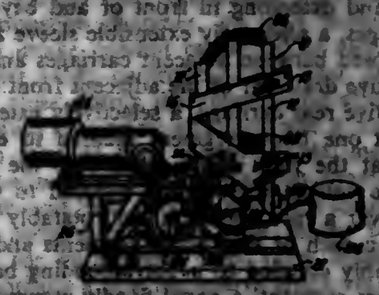
---



2,770,215
CONTINUOUS ROTARY DEVICE FOR INKING RIBBON
John F. Sellers, Detroit, Mich.
Application November 17, 1953, Serial No. 392,564
9 Claims. (Cl. 118—260)

1. A ribbon inking device comprising, a frame adapted for mounting on a printing machine, a roller arm pivoted on the frame and carrying an ink transfer roller, a spring interconnecting the roller arm and frame for yieldably urging the transfer roller against an inking ribbon on the printing machine, a cartridge arm pivoted on the frame for movement in substantially the same plane as the roller arm, the cartridge arm carrying an ink supply cartridge having an ink reservoir and means including a wick for inking said transfer roller, and a spring interconnecting said cartridge arm and frame yieldably urging a portion of said wick against said transfer roller to

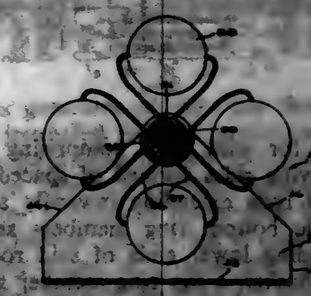
2,770,216
SPRAYING APPARATUS FOR WEB MATERIAL
Alfred Schock, Elmhurst, N. Y., assignor to Alexander Smith, Incorporated, Yonkers, N. Y., a corporation of New York
Application August 16, 1955, Serial No. 527,467
2 Claims. (Cl. 118—323)



1. An apparatus for spraying an advancing web, comprising a bar pivotally secured to a fixed support to

outflow in a plane parallel to said web, a spray head secured to the free end of said bar so as to oscillate therewith in an arcuate path across said web, means including a cylinder and a fluid motor piston connected to said bar, said piston being disposed to travel in a path substantially transverse of said web, whereby the transverse component of the rate of traverse of said head is substantially proportional to the rate of traverse of said piston, an air duct disposed on the side of said web opposite said head, said duct comprising a channel member closed at the top by said web and projecting beyond said web at both sides of the path of the spray to collect overspray during traverse of said head, and means supplying air under slight pressure to said duct to produce an air current at the sides of the web adapted to prevent drifting of overspray to the back of said web.

---



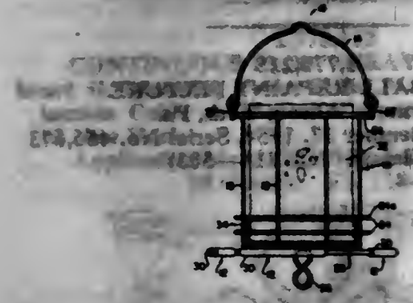
2,770,217
CEMENT APPLICATOR FOR BRAKE LINING
Antonin J. Kasak, South Bend, Ind., assignor to Bendix Aviation Corporation, South Bend, Ind., a corporation of Delaware
Application November 20, 1952, Serial No. 321,636
6 Claims. (Cl. 118—410)

6. A machine for covering the inner surface of brake lining with an adhesive including a hopper member shaped to receive nested pieces of lining, a plurality of roller members, some of which are driven, positioned beneath the hopper and serving to both move and direct the path of movement of the lining as it leaves the hopper, means for feeding the several pieces of lining to the roller members, means for changing the mode of operation of a part of the feeder means and for adjusting the relative position of the several rollers, power means for actuating the feeder mechanism and the driven rollers, and an extrusion nozzle for covering each piece of lining with cement as it leaves the rollers said nozzle being adjustably positioned beneath two of the guide roller members and opposite one of the driven roller members.

---

2,770,218
GOLF BALL REPAINT FIXTURE
Wayne E. Wilson, York, Pa.
Application September 17, 1954, Serial No. 456,673
3 Claims. (Cl. 118—503)

1. A repainting fixture for golf balls comprising a support including a flat base portion and a pair of upstanding end arms, a horizontal shaft spaced above said flat base portion and rotatably mounted in said end arms



adjacent the free ends thereof, and a resilient ball clamping member mounted on the pintles of said shaft between said arms for rotation therewith, said ball clamping member comprising a pair of opposing resilient clamping jaws having inwardly projecting end portions adapted to engage diametrically opposite portions of a golf ball.

2,770,219
STARTING GATE
Asa T. Blanks, New York, N. Y.
Application September 22, 1954, Serial No. 457,590
2 Claims. (Cl. 119—18.5)

1. A starting gate for handicap horse racing comprising a plurality of linearly disposed wheeled carriages each behind another forming a train of cars having a lead car, a draw-bar secured linearly to each of said carriages and extending in front of and beyond each of said carriages, a selectively extensible sleeve and bar coupling disposed between adjacent carriages and secured to the respective draw-bar of the adjacent front carriage and the respective rear carriage, a selectively extensible boom of at least one boom segment secured to each of said carriages at the right angle relative to the longitudinal axis of the vehicle thereto and adapted to extend horizontally over a raceway, a bar rotatably horizontally disposed on each of said boom segments and adapted to be removably coupled to a corresponding bar in an adjacent boom segment, a panel fixedly secured to each of said rotatable bars and having a restraining netting fixedly secured thereto, motivating means for moving and controlling the speed of said string of cars, means for starting said motivating means located in the lead car of said string of cars, and means for rotating said bars of said boom segments located in said lead car.

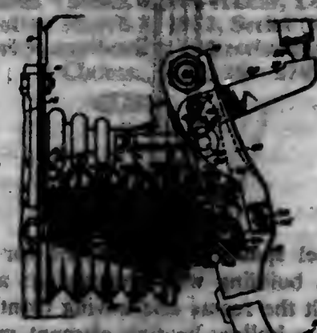
2,770,220
BIRD FEEDER
Donald R. Hyde, Newtonville, Mass.; Joyce P. Hyde, executrix of Donald R. Hyde, deceased, assignor to Joyce P. Hyde, Newton, Mass.
Application July 10, 1953, Serial No. 367,249
3 Claims. (Cl. 119—60)

1. A feeder for wild birds comprising a cylindrical wire basket having sides formed of spaced parallel vertical rods, said rods extending inwardly at their lower ends, concentric bottom ring members secured to the inwardly extending lower ends of said rods to form a bottom to the basket, a top ring member secured to the top ends of the vertical rods, the sides of said basket being open to permit a bird the size of a finch to enter the interior thereof, a bail having a centrally situated eye pivotally secured to diagonally opposite points of the top ring member, and wire perches spaced outwardly from said extending horizontally alongside the basket, said bail being pivotally movable on said points, said perches being flexibly secured at one end of the bottom of the basket and unsecured at the other end, and a tubular rubber-like material covering said perches.

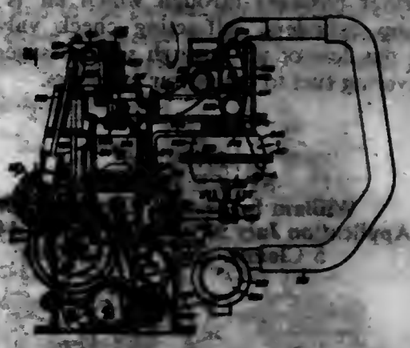
2,770,221
FOUNTAIN PEN
William Tenkowich, Norwalk, Ohio, assignor to Waterman Pen Company, Inc., a corporation of New York
Application March 28, 1955, Serial No. 218,145
5 Claims. (Cl. 120—39)

1. A feed bar for a fountain pen in which one end of the feed bar is fitted within the base of a feed section with a heel portion of a pen nib being held between the feed bar and the feed section, said feed bar having an ink feed groove extending longitudinally along the top thereof, said feed groove communicating with an ink reservoir at said one end of the feed bar and with a point of the pen nib at the other end of the feed bar, which is characterized by said feed bar having side pockets extending along each side of the feed bar intermediate its ends, a series of transverse ladder cuts in the sides of the feed bar and the side walls of each of the side pockets forming capillary ink storage chambers therein, a number of said ink storage chambers being located within the feed section, portions of adjacent sides of the feed bar being spaced from each other whereby the ink storage chambers on each side of the feed bar are in communication with each other through capillary passageways formed between the pen nib and the feed bar, said feed bar having transverse channels extending between the ink feed groove and the side pockets on each side of the feed bar, and a back groove extending along the bottom of the feed bar from the tip thereof to a point on the feed bar located within the feed section, said back groove communicating with the pen point at the tip of the feed bar and having an enlarged opening therein intermediate its ends, said enlarged opening extending from a point on the feed bar located within the feed section to a point on the feed bar located outside of the feed section and forming a passageway extending between the ink storage chambers located within the feed section and the extension of the feed section.

2,770,222
HYDRAULIC SYSTEM OF LATHES AND OTHER METAL WORKING MACHINES, PRESSES, AND THE LIKE
James Anderson, Newton Mearns, Scotland
Application April 30, 1954, Serial No. 426,795
Claims priority, application Great Britain May 13, 1953
2 Claims. (Cl. 121—39)



1. In a lathe, metal working machine, hydraulic presses and the like an hydraulic feed system comprising a cylinder with differential piston working therein, a control valve comprising a valve body and a manually operable



shuttle valve member working therein, means whereby, irrespective of the position of the shuttle valve member, hydraulic pressure fluid supplied to the valve body is fed to said cylinder to act on the annular face of the differential piston, means by which, on the manual operation of the shuttle valve member in one direction pressure fluid is also fed to act on the head of the differential piston to effect the feed of the lathe, press and the like, means by which, when the shuttle valve member is moved in the other direction the supply of pressure fluid to act on the piston head is interrupted and thereafter the fluid acting on the piston head is opened to exhaust and means to move the shuttle valve member in such other direction comprising a snap action valve sensitive to the pressure of the fluid acting on the piston head and controlling the passage of pressure fluid to act on the end of the shuttle valve member, said snap action valve momentarily opening when a predetermined pressure acts thereon to permit a short sharp surge of pressure fluid to pass to the end of shuttle valve member, the kinetic energy of such fluid acting on the shuttle valve member first moving the valve member so that it cuts off the supply of pressure fluid to the piston head and thereafter permits the fluid acting on the piston head to exhaust.

2,770,223
FLUID PRESSURE OPERATED MOTOR
David T. Ayres, Jr., and Edward Govan Hill, Birmingham, Mich., assignors to Kelsey-Hayes Wheel Company, Detroit, Mich., a corporation of Delaware
Original application April 2, 1954, Serial No. 420,488. Divided and this application March 14, 1955, Serial No. 494,204
13 Claims. (Cl. 121—41)

1. A fluid pressure operated motor comprising a stationary head, a movable head spaced therefrom, and a bellows connecting said heads and forming therewith an internal variable pressure chamber, a valve mechanism carried by said movable head and comprising a pair of valve elements one of which is fixed to said movable head and the other of which is movable independently of said movable head, an air cleaner carried by said movable head, said valve elements being constructed to establish communication between said variable pressure chamber and the atmosphere through said air cleaner when said movable valve element is in a normal position, a vacuum chamber in said movable head, said movable valve element being movable from its normal position to disconnect said variable pressure chamber from the atmosphere and connect it to said vacuum chamber whereby said movable head is moved by atmospheric pressure toward said stationary head, a [illegible] turning movement on [illegible], said lever being pivotally [illegible] said stationary head, and means independent of said lever for moving said movable valve from its normal off position.

2,770,224
INTERNAL COMBUSTION ENGINE
George M. Holley, Richmond, Mich., Mary M. Holley, executrix of said George M. Holley
Original application December 23, 1950, Serial No. 202,974. Divided and this application May 17, 1955, Serial No. 508,467
11 Claims. (Cl. 123—48)

1. In a variable compression internal combustion engine, the combination of, a cylinder and piston assembly including, a cylinder, a cylinder head, a piston reciprocating in said cylinder and cooperating with said head to form a combustion chamber, an inlet passage to said cylinder, an intake conduit connected to said inlet passage, an inlet valve controlling said inlet passage and operated to close during the compression stroke of said piston to obtain volumetric efficiency and a high effective compression ratio at high engine speeds, means to increase the capacity of said combustion chamber at low engine speeds and high conduit pressures to decrease the mechanical compression ratio, and means to positively compensate for unfavorable inlet valve timing at such speeds, comprising a flow responsive check valve adjacent said engine operated valve operating to prevent rejection of the fuel and air charge from the cylinder to the intake conduit and its adverse effect on compression ratio and thereby maintain a substantially full fuel and air charge in said engine for higher torque output at lower engine speeds.

2,770,225
CONTROLLED STROKE, PISTON TYPE GAS GENERATOR FOR PRODUCING GAS TO OPERATE TURBINES, ETC.
Vincent E. Peterson, Cleveland Heights, Ohio
Application September 17, 1954, Serial No. 456,795
9 Claims. (Cl. 123—46)

1. In a gas generator of the class described, a housing, a shaft journaled therein, means on the shaft for converting reciprocatory motion into rotary motion, an elongate piston structure provided intermediate its ends with means for operatively connecting it to the former means, said structure terminating at each end in a power piston, a pump piston of considerably greater diameter than the power pistons intermediate one of the former pistons and the second mentioned means, the housing including power cylinders wherein the power pistons operate, and a pump cylinder wherein the pump piston reciprocates, the housing being provided with exhaust

ports communicating with the power cylinders and controlled by the pistons therein, the housing also enclosing air compartments and being provided with ports through which said compartments communicate with the power cylinders and which are likewise controlled by the power pistons, the housing having passages through which the pump cylinders communicate with said compartments and further passages through which air is admitted to the pump cylinders, self-acting check valves for controlling the flow of air through said passages, and means for delivering fuel to the power cylinders.

---

2,770,226
SPACE HEATER
William L. Tenney, Dayton, Ohio
Application July 9, 1954, Serial No. 442,292
5 Claims. (Cl. 123—142.5)

1. A heating system for circulating fresh heated air through an enclosed space, comprising a pulse jet combustion device including a combustion chamber and a discharge tube terminating in an outlet for discharging the exhaust gases from said combustion chamber, a jacket surrounding said combustion chamber and extending beyond said discharge tube outlet, said jacket being closed at the end thereof adjacent said combustion chamber and open at the other end thereof, a partition in said jacket spaced upstream of said discharge tube from said outlet thereof to leave a minor portion of said discharge tube projecting therebeyond, an inlet to the interior of said jacket on the opposite side of said partition from said discharge tube outlet for admitting fresh air to be heated by passage over said discharge tube and combustion chamber, a supply conduit leading from said closed end of said jacket to said enclosed space for conducting the resulting heated air from the interior of said jacket to said enclosed space, and an exhaust conduit leading from said space for conducting air from said space to said jacket and connecting with said jacket at a position between said partition and said discharge tube outlet to cause the discharge flow of exhaust gases from said outlet to induce a flow of said heated air from said jacket through said space and out said exhaust conduit.

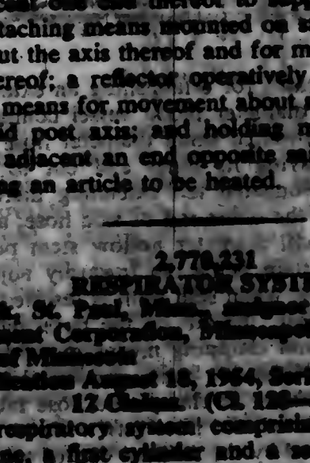
2,770,227
COMBUSTION CHAMBER
Edgar Haigh, Wyandotte, and Paul F. Keydel, Detroit, Mich., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application November 28, 1952, Serial No. 322,926
7 Claims. (Cl. 123—191)

1. A combustion chamber for engines comprising an engine cylinder having a piston therein and a head for said cylinder, said head being formed to provide a firing chamber for said combustion chamber in directly opposed relation to said cylinder, said firing chamber being formed to provide a plane surface and a pair of adjacent but oppositely disposed frusto conical surfaces, said plane and frusto conical surfaces being surfaces of revolution and translation with the axis of rotation thereof being normal to said plane surface and the plane of translation thereof being a plane through said axis and parallel to said plane surface, said frusto conical surfaces being formed on the cylinder side of said plane surface with the adjacent and outer edges thereof merging in a curved surface and being disposed with the apex of one of said frusto conical surfaces on one side of said plane surface and the apex of the other of said frusto conical surfaces on the opposite side of said plane surface, said frusto conical surfaces also being formed with the inner edge of one of said surfaces merging with said plane surface and the inner edge of the other of said surfaces merging with a peripheral edge of said cylinder, and a spark plug opening extending into said cavity on an axis substantially normal to one of said frusto conical surfaces.

---

2,770,228
FUEL BURNING WALL SPACE HEATER
Louis E. Nordblatt and Murray Wilhelm, Nashville, Tenn., assignors to Temco, Inc., Nashville, Tenn., a corporation of Tennessee
Application September 11, 1953, Serial No. 379,583
3 Claims. (Cl. 126—116)



1. A fluid fuel space heater adapted for installation in a recess in a building wall comprising: a metal casing adapted to fit the recess and having front, back, side, and top panels; a hollow heating element mounted vertically in said casing in spaced relation to said front panel, said element being of substantially uniform width with the sides thereof disposed closely adjacent said casing side panels to form front and back passages for upward passage of air, the upper portion of said element terminating in a pair of laterally-spaced tubes for forward flow of air therebetween from said back passage; a fuel burner mounted in said casing below said heating element for discharging products of combustion thereinto; means for connecting said tubes to a flue within the building wall; means defining a lower cold-air inlet and an upper hot-air outlet in said casing front panel, said outlet extending from the upper ends of said tubes downwardly past the lower ends thereof; and a forwardly-inclined baffle at the front of said heating element adjacent the lower ends of said tubes for deflecting air rising in said front passage outwardly through the hot-air outlet.

2,770,229
SOLAR HEATING APPARATUS
Adnan Tarcici, Hatice Akbas Lehmann
Application October 7, 1952, Serial No. 313,486
Claims priority, application Switzerland August 27, 1949
12 Claims. (Cl. 126—270)

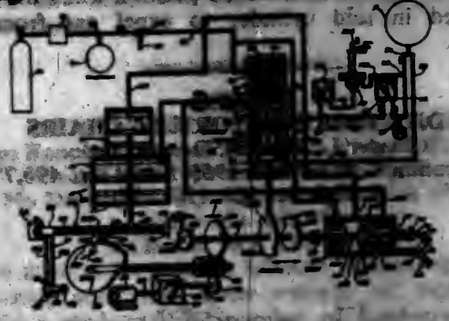
1. Solar heating apparatus, comprising, in combination, a post adapted to have one end thereof supported on the ground or the like, universal joint means located on said post at an end opposite to said one end thereof, a reflector connected at its center to said universal joint means so as to be turnable in all directions with respect to said post; an elongated, rigid member connected to said reflector, located in front of the same, and extending

along the optical axis thereof; and carrier means, adapted to carry an article to be heated, adjustably connected to said elongated member at an end thereof distant from said reflector for providing, irrespective of the inclination of the reflector, an upper horizontal surface to receive the article to be heated.

---

2,770,230
SOLAR HEATING APPARATUS
Adnan Tarcici, Hatice Akbas Lehmann
Application March 8, 1952, Serial No. 275,530
Claims priority, application Switzerland August 27, 1949
6 Claims. (Cl. 126—270)

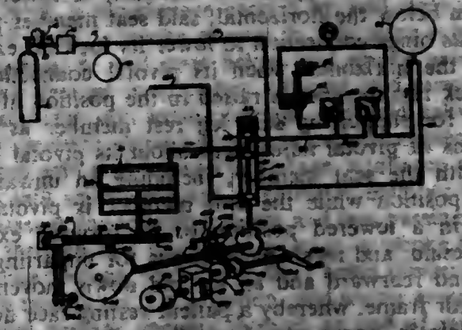
1. Solar heating apparatus, comprising, in combination, an elongated post; support means connected to said post adjacent one end thereof to support said post vertically; attaching means mounted on said post for movement about the axis thereof and for movement along the length thereof; a reflector operatively connected to said attaching means for movement about an axis perpendicular to said post axis; and holding means mounted on said post adjacent an end opposite said one end thereof for holding an article to be heated.



---

2,770,231
RESPIRATOR SYSTEM
Tage Falk, St. Paul, Minn., assignor to Smith Welding Equipment Corporation, Minneapolis, Minn., a corporation of Minnesota
Application August 18, 1954, Serial No. 450,534
12 Claims. (Cl. 128—29)

1. A respiratory system comprising a respirator gas supply line, a first cylinder and a second cylinder each having a port and each having a piston therein, means for operating the pistons in said cylinders simultaneously

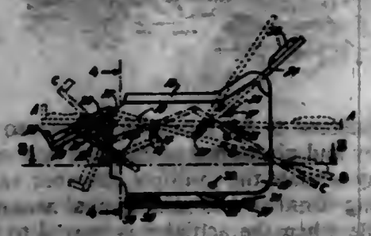


for simultaneously drawing in and expelling gas thru the ports of the first and second cylinders, a patient supply line for conducting respirator gas to the patient and a patient exhaust line for exhausting gas from the patient, a multiple chamber valve and manual valve having a manual operation for moving said manual valve to first and second positions, said multiple chamber valve and manual valve being connected to each other and to the cylinder ports and to the patient supply and exhaust lines, a mechanical drive connected to the pistons for positively actuating them in their cylinders, and first and second

cam means connected to the mechanical drive so as to be actuated thereby and positioned so that the first or second cam means may actuate the multiple chamber valve, said cam means being connected to said manual actuator so as to be traversable when the actuator is moved to first and second positions such that the first cam means actuates said multiple chamber valve when the manual actuator is moved to place said manual valve in its first position and the second cam means actuates said multiple chamber valve when the actuator is moved to place said manual valve in its second position.

---

2,770,232
RESPIRATOR SYSTEM
Tage Falk, St. Paul, Minn., assignor to Smith Welding Equipment Corporation, Minneapolis, Minn., a corporation of Minnesota
Application May 26, 1954, Serial No. 432,532
25 Claims. (Cl. 128—29)



1. A respiratory system comprising a respirator gas supply line, a cylinder having a port and a piston operable in said cylinder for drawing in and expelling respirator gas through said port, a patient supply line for conducting respirator gas to the patient and a patient exhaust line for exhausting gas from the patient; multi-chamber valve means including two-way and one-way valve sections, said two-way section having ports connected respectively to said cylinder port, said respirator supply line and said patient supply line, said one-way section being connected in said patient exhaust line for opening and closing said line, said multi-chamber valve means including valve mechanism connected to be actuated by cam means and movable to alternate first and second positions in which, in said first position as the cam means moves the piston to draw gas into said cylinder port, the respirator gas supply line is connected to the port of the cylinder and said

patient exhaust line is opened to atmosphere and said patient supply line is closed and in said second position said first means moves the piston to expel gas from said cylinder port, said respirator gas supply line said patient exhaust line are both closed and said cylinder port is connected to said patient supply line; said cam drive means connected to the piston for actuating the piston in said cylinder and including said valve mechanism cooperatively to move said valve mechanism to the first position when the piston is actuated in the cylinder to draw gas into said cylinder and to said second position when the piston is actuated in said cylinder to expel gas from said cylinder.

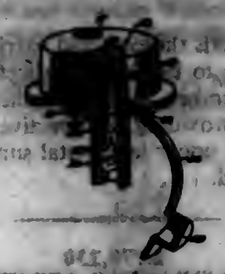
2,770,235
ADJUSTABLE MOTORIZED CHAIRS
Chester L. Thomas, Denver, Colo.
Application February 28, 1955, Serial No. 490,776
2 Claims. (Cl. 128—33)

1. An adjustable chair for therapeutic purposes comprising a frame having a pair of side panels; a seat member hingedly disposed between said panels on an axis intermediate of the length of said seat member; a leg rest member pivoted to the forward end of said seat member; a back rest member pivoted to the rear end of the seat member, said back member being provided adjacent to its outer extremity with an aperture and an annular cushion framing said aperture; adjustable means for supporting said back rest member in various positions of pivotal adjustment, including a position at which its pivotal connection with the seat member is raised above the horizontal and the apertured extremity is lowered to a position below the horizontal; said seat member pivoting about its hinge connection to lower its forward extremity below the horizontal when its pivotal connection with the back rest member is raised in the position aforesaid; means for supporting said leg rest member at various positions of pivotal adjustment about its pivotal connection with the seat member, including an upwardly inclined position while the seat member is pivotally adjusted in a lowered position of its forward extremity as aforesaid; and mechanical means for imparting a forward and rearward and an up and down movement to said chair frame, whereby a patient resting face down on said chair in genupectoral position with the face supported on said annular pillow, with the knees positioned at the pivotal junction between the seat portion and the leg rest portion, is given a gentle continuous oscillating motion to further therapeutic action.

---

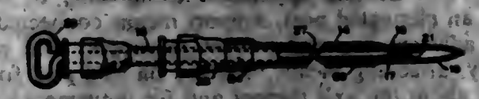
2,770,234
PARENTERAL ADMINISTRATION OF LIQUIDS
Nassrie M. Nemet, Palestine, and Cyrus R. Brenner, Evanston, Ill., assignors to Baxter Laboratories, Inc., Morton Grove, Ill., a corporation of Delaware
Application April 5, 1954, Serial No. 421,654
8 Claims. (Cl. 128—214)



1. In combination with the closure for an inverted liquid dispensing container, passage-providing means for exhausting liquid therefrom, passage-providing means for admitting air thereto, said air passage means being obstructed by a non-liquid-penetrable, air-permeable membrane, said air passage means including an air collection chamber inward of said membrane, said chamber being

provided with a bubble-forming outlet adjacent the liquid in said container.

---



2,770,236
PARENTERAL ADMINISTRATION OF LIQUIDS
Nassrie M. Nemet, Palestine, and Cyrus R. Brenner, Evanston, Ill., assignors to Baxter Laboratories, Inc., Morton Grove, Ill., a corporation of Delaware
Application June 29, 1953, Serial No. 364,684
4 Claims. (Cl. 128—214)

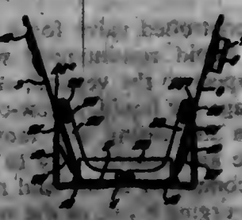
4. An air inlet tube insertable in the air inlet opening of a container of the type described, said air inlet tube providing a passage for the admission of air, said passage including a capillary portion and an enlarged portion inwardly thereof providing a collection chamber for the air passing through the capillary portion, and wherein at least the walls of said collection chamber are substantially hydrophobic and said passage gradually enlarges in cross-sectional area from said capillary passage portion into said collection chamber portion.

---

2,770,237
SURGICAL NEEDLE AND METHOD FOR BLOOD TRANSFUSION OR INTRAVENOUS FEEDING
George D. Udey, Forest Hills, and Sidney Hirsch, Cedarhurst, N. Y.
Application December 31, 1954, Serial No. 478,985
9 Claims. (Cl. 128—221)

1. Surgical apparatus for establishing an external connection to a small diameter blood vessel comprising, in combination, a thin-walled small diameter hose of inert, flexible material having its inner end cut to form at least one narrow elongated tab extending therefrom; a coupling secured to the outer end of said hose; a surgical needle having a small diameter hollow stem pointed at its inner end, said stem being cut inwardly adjacent its pointed end whereby, when said stem is inserted through said coupling and hose, the tab on the hose may be engaged in said cut; and clamping means movable in said stem relative to at least the main portion thereof and constructed and arranged to clamp said hose tab to said stem to draw the end of said hose into a blood vessel as the latter is punctured by the pointed end of said needle; said clamping means and at least the main portion of said stem being relatively manipulable to disengage the hose tab from said stem to provide for withdrawal of said stem from said hose and coupling while leaving the inner end of said hose inserted in said blood vessel.

---



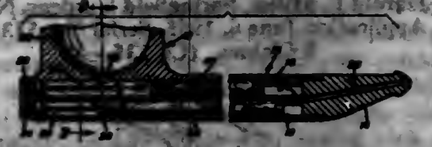
2,770,237
BABY DIAPER
Harriet Stern, New York, N. Y.
Application August 14, 1953, Serial No. 374,299
1 Claim. (Cl. 128—287)

A diaper of the character disclosed comprising an inner panel having opposite edge portions thereof folded inwardly into adjacency to the inner face thereof, a water-proof panel disposed outwardly of said inner panel and having opposite edge portions thereof folded inwardly into lapping engagement with said first inwardly folded portions, a pair of like panels of soft absorbent material of substantially greater width than said first and second panels, one of said pair of panels having one edge portion thereof folded inwardly into contact with one of said inwardly folded portions of said water-proof panel, said one of said pair of panels having spaced folds providing a plurality of superposed layers intermediate the folded edge portions of the first and second named panels, the other of said pair of panels having one edge portion thereof folded inwardly into contact with the other of said inwardly folded portions of said water-proof panel, said last panel being also provided with spaced folds providing a plurality of superposed layers inwardly of said first plurality of layers, and means securing all of said inwardly folded edge portions together.

---

2,770,238
LOOSE LEAF FILING TRAYS OR BINDERS
Frederick Robert Sewell, Beckenham, England, assignor to Percy Jones (Twinlock) Limited, Beckenham, England
Application June 28, 1952, Serial No. 296,112
5 Claims. (Cl. 129—16)

1. A filing tray comprising a flat generally rectangular base plate, a pair of cover members hingedly mounted at their bases on parallel sides of said base plate so as to be movable between a "closed" position in which they extend substantially vertically upwardly and an "open" position in which they incline outwardly away from the base plate and one another, a pair of abutment members each secured to the outer surface of a respective cover member and each providing both a downwardly and an inwardly facing abutment surface, a pair of support members each slidingly engaging the base plate and each including an upwardly projecting arm having a portion disposed between a cover member and the inwardly facing abutment surface of the abutment member secured thereto and disposed directly below the downwardly facing abutment surface of said abutment member, whereby sliding movement of each of said support members away from and towards the base plate is caused by movement of the corresponding cover member to the "open" and "closed" positions respectively by virtue of the couplings established between the said arms of said support members, said inwardly facing abutment surfaces and the outer surfaces of the cover members, and whereby further outward tilting of said cover members is prevented by virtue of the couplings established between said arms and said downwardly facing abutment surfaces.

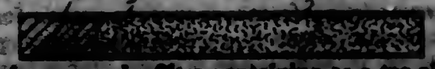


---

2,770,239
PROCESS OF TREATING TOBACCO
Jose Romero Prats and Francisco Romero Prats II, Pasay City, Republic of the Philippines
No Drawing. Application February 4, 1952, Serial No. 269,892
2 Claims. (Cl. 131—142)

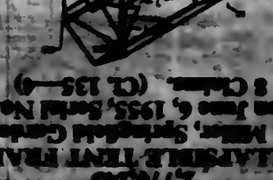
1. A process for treating tobacco comprising the steps of making successive water extracts of said tobacco wherein a predetermined number of successive extracts are made at room temperature, 60° C., 80° C., and 100° C., respectively, bleaching said remaining tobacco with hydrogen peroxide and saturating said bleached tobacco with at least one and not more than one less than the predetermined number of the above tobacco extracts made at the lower temperatures with reference to room temperature.

---



2,770,240
SMOKER'S PIPE
Francis C. Stamber, Sturgeon Bay, Wis.
Application January 6, 1954, Serial No. 402,497
1 Claim. (Cl. 131—243)

A smoking pipe comprising a bowl, a stem attached to said bowl, a mouthpiece carried by said stem remote from said bowl, a smoke passage in said stem, a parallel saliva passage in said stem below said smoke passage, a transverse passage in said stem adjacent said mouthpiece communicating said smoke passage and said saliva passage, an upwardly sloping passage in said mouthpiece communicated with said transverse passage, a tobacco and ash filter in said smoke passage, a collector member in said saliva passage for collecting saliva and tars passing downwardly through said transverse passage, a smoke filter in said smoke passage, said smoke filter being similar to said collector member in configuration, said smoke passage and said saliva passage opening through an end of said stem remote from said mouthpiece, closures removably seated in open ends of said smoke passage and said saliva passage to permit access to said filters and said collector member, said tobacco and ash filter being secured to said closure for said smoke passage and supported thereby in spaced relation thereto.

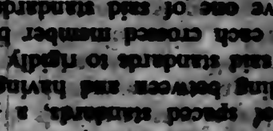


---

2,770,241
TOBACCO SMOKE FILTER AND METHOD
Joseph Whitlier, Queens, N. Y., assignor to American Cello Corporation, New York, N. Y.
Application May 18, 1956, Serial No. 585,799
7 Claims. (Cl. 131—209)

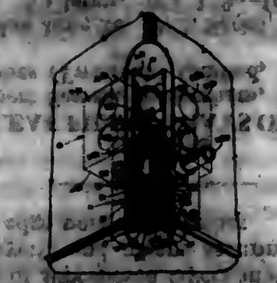
1. A tobacco smoke filter consisting as a tar absorbent an open cell polyurethane cellular plastic material.

## 2,770,243
## LADDER DISENGAGEMENT PREVENTER
Bessie L. Thayer, Mrs. Gertrude C. Cole, Appleton, Assignors to Gertrude C. Cole, Appleton, and Harold F. Meier, Sheboygan Falls, Wis.
Application August 24, 1953, Serial No. 376,071
3 Claims. (Cl. 134—43)



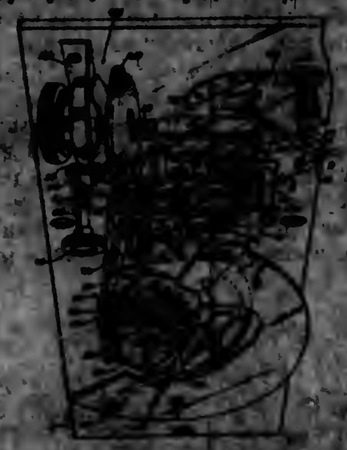
1. In a collapsible tent frame, a pair of crossed members each having a pair of spaced sockets, a pair of crossed members extending between and having their opposite ends pivoted to said standards to rigidly connect the latter, one end of each crossed member being detachable from its respective one of said standards for collapsing said standards, and crossed members, a key xone linkage having one end connected to one of said standards for extension and retraction in a plane disposed at an angle with respect to the plane of said standards, and fastener means carried by said linkage to hold the latter in its extended condition, whereby a second identical two wall unit is adapted for connection to said linkage and the other of said standards to define a four wall structure.

## 2,770,244
## PORTABLE DRESSING ROOM
Nicholas Cassos, Hamden, Tex.
Application October 26, 1954, Serial No. 464,557
2 Claims. (Cl. 135—9)



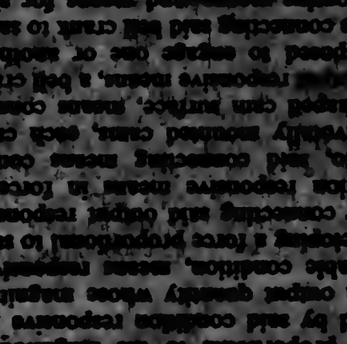
1. A portable dressing room for use with an automobile or like vehicle, comprising, a generally annular curtain-supporting frame, mounting means for supporting the curtain frame in generally horizontal position at one side of an automobile window frame having upper and lower glass guide channels, said mounting means including a pair of spaced apart brackets, each bracket having a pair of spaced apart arms, each arm having a pair of spaced apart fingers, said fingers being adapted to be received in the glass guide channels, and a pair of pivot pins, each pivot pin extending through the fingers of one of said pairs of arms and through the curtain frame, whereby the curtain frame may be swung about the pivot pins to a position within the automobile.

## 2,770,245
## COMBINATION TUBE FRAME
Harold F. Meier, Sheboygan Falls, Wis., Assignor to Gertrude C. Cole, N. Y.
Application June 6, 1955, Serial No. 513,199
8 Claims. (Cl. 135—6)



1. A portable dressing room for use with an automobile or like vehicle, comprising, a generally annular curtain-supporting frame, mounting means for supporting the curtain frame in generally horizontal position at one side of an automobile window frame having upper and lower glass guide channels, said mounting means including a pair of spaced apart brackets, each bracket having a pair of spaced apart arms, each arm having a pair of spaced apart fingers, said fingers being adapted to be received in the glass guide channels, and a pair of pivot pins, each pivot pin extending through the fingers of one of said pairs of arms and through the curtain frame, whereby the curtain frame may be swung about the pivot pins to a position within the automobile.

## 2,770,246
## GRAVITY-CONTROLLED VALVES FOR CONTINUOUS LIQUID SUPPLY TANKS
Kenneth William Ivy, North York, Ontario, Canada, assignor to Ontario Research Foundation, Toronto, Ontario, a corporation
Application November 7, 1952, Serial No. 320,975
3 Claims. (Cl. 137—39)



1. A gravity-controlled valve for a tank that must be able to supply liquid continuously when it is in any position with respect to the vertical, comprising a casing enclosing a passage for liquid, a flow-controlling member reciprocatable in the casing and movable one way to open the passage and another way to close the passage, resilient means connected to the said member and exerting a force on it urging it one of the said ways, a flexible connector with one end attached to the said member, guide means connected to the casing and adapted to part of the connector near the said member to flow under the influence of the said resilient means, the other end of the connector being attached to the said member through the connector when the casing is in one position with respect to the vertical to urge the said member in the direction of the said resilient means, the weight attached to the other end of the connector, the weight being greater than the said force and supported by the said member through the connector when the casing is in one position with respect to the vertical to urge the said member in the direction of the said resilient means, the weight being unable to overcome the said resilient means to flow under the guide means, and a surface rigidly connected to the said casing within the radius of the said arc to support the weight against gravity when the casing is in another position with respect to the vertical to allow the resilient means to urge the said member in the first mentioned way.

1. In a pressure-control apparatus having a source of liquid under pressure, said apparatus comprising a casing, a bellows connecting said bell crank to said variable condition responsive means for shifting the bell crank and cam following member relative to the cams to effect engagement of said follower with one or another of said cams only when the cams are in a predetermined position.

## 2,770,247
## ENGINEMENTS
William D. Hosking, Bellerose, Pa., assignor to American Machine and Metals, Inc., New York, N. Y., a corporation of Delaware
Application September 28, 1954, Serial No. 456,261
12 Claims. (Cl. 137—36)

1. A variable condition responsive device provided with means responsive to said variable condition and to develop a force proportional to the magnitude thereof, means actuated by said condition responsive means for establishing an output quantity whose magnitude varies with said variable condition, means responsive to said output for developing a force proportional to said output, said means for connecting said output responsive means to said condition responsive means in force opposing relation thereto, said connecting means comprising a pivotally mounted cam, each cam having a differently shaped cam surface, means connecting the cams to said output responsive means, a bell crank having a follower disposed to engage one of another of said cams, a bellows connecting said bell crank to said variable condition responsive means, a fulcrum for said bell crank and cam following member relative to the cams to

1. Apparatus for flushing a beer coil in a beer dispensing system including a beer supply source and a dispensing spigot, said apparatus comprising a mixing tank for storing a cleaning solution, having a warm water inlet connection and an outlet connection, a three-way remote valve having a first inlet port connective to said source, a second inlet port connective to said outlet connection and having an outlet port connectible to said coil and spigot, electrical control means including an electrical switch for operating said magnetic valve so as to selectively connect either said mixing tank outlet connection or said beer supply source to said coil and spigot and equal means associated with said dispensing spigot.

## 2,770,249
## CONTROL MEANS FOR SELECTIVE OPERATION OF VALVES
Theo. Bertram, Nelson Avenue, Bellport, assignor to Bellport Marine Products, Inc., Bellport, a Corporation of New York
Application May 25, 1951, Serial No. 228,543
Divided and this application December 29, 1953, Serial No. 400,339
6 Claims. (Cl. 137—625)

5. For use on a water heating system having a hot water tank, the combination comprising a manual control lever fixed to said control shaft for rocking about the axis thereof, a manual control valve, a diverter valve having a first inlet port connective to said valve, a second inlet port connective to said source, a second inlet port connective to said heating tank and a third port connective to said tank, the valve of said diverter valve being movable between a position connecting said first inlet port to said third port and a position connecting said second inlet port to said third port, and means connecting said control lever to said valve for moving the valve of said diverter valve between said positions in response to rocking of said control shaft.

## 2,770,250
## COIL CLEANER FOR BEER DISPENSING SYSTEMS
Benjamin Adams-Weatherspoon, Pa.
Application April 22, 1953, Serial No. 350,728
4 Claims. (Cl. 137—240)

selector valve, a valve plunger in said selector valve chamber, said control shaft disposed for reciprocation along and rotation on said axis, a manual control lever mounted for bodily movement with said manual control lever as well as independent and fully rotatable movement with respect to said control lever, and a connecting linkage interposed between said control knob and said selector valve plunger, said linkage being ineffective to actuate said valve plunger during said bodily movement only but effective to actuate said plunger during said independent rotatable movement.

---

2,770,250
INLET VALVE FOR FLUSH TANKS
Harry F. Smith, Lexington, Ohio, assignor to Mansfield Sanitary Pottery, Inc., Perrysville, Ohio, a corporation of Ohio
Application June 2, 1953, Serial No. 359,864
4 Claims. (Cl. 137—426)

1. In a flush tank, an inlet pipe having a valve seat at its discharge end, an endwise movable hush pipe around said inlet pipe, stop means engageable with said hush pipe to limit the extent of its endwise movement, a housing carrying a valve to engage said seat and connected to one end of said hush pipe for circumferential and endwise movement thereon to vary the extent of opening of the valve, a collar surrounding and loosely engaging said housing for substantially non-axial (rotational movement relative thereto, a float-carrying lever pivotally connected to said collar, said a strut having one end portion connected to said lever and the other end portion U-shaped and positioned transversely of the strut with the free leg thereof pivotally connected to the inlet pipe adjacent to the outlet end of the hush pipe, said U-shaped portion being manually adjustable about a horizontal axis to vary the water level.

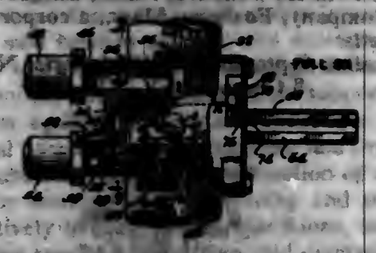
2,770,251
QUICK-ACTING REDUCING VALVE
Robert H. Goddard, deceased, late of Annapolis, Md., by Esther C. Goddard, executrix, Worcester, Mass., assignor of one-half to The Daniel and Florence Guggenheim Foundation, New York, N. Y., a corporation of New York
Application June 25, 1953, Serial No. 364,695
1 Claim. (Cl. 137—488)

A quick-acting reducing valve for a controlled pressure system comprising a valve body having inlet and discharge connections, an interposed port and a valve member therefor, a spring to move said valve member in a direction to close said port, a control unit comprising an actuating part movable to engage and shift said valve member to open said port, springs to effect such movement of said actuating part, a pressure connection between the discharge passage of said reducing valve and said control unit, whereby the discharge pressure balances the spring pressure at a predetermined regulating position of said valve member, and said control unit including a bellows member, means to admit auxiliary air under pressure from an auxiliary air supply to said bellows member to further open said reducing valve on a drop in pressure in the controlled system, and quick-acting auxiliary means to

accelerate the valve-opening action of said actuating part, and said quick-acting auxiliary means comprising a member in said control unit, which member is directly exposed to said auxiliary air under pressure and which member acts directly to move said actuating part and to thereby quickly open said reducing valve when said member is moved by said auxiliary air under pressure and before the bellows member completes its relatively slow response to said auxiliary air pressure.

---

2,770,252
GAS PRESSURE REDUCTION REGULATOR
Harvey G. Rose, Sr., Shaker Heights, Ohio, assignor to Alice M. Rose, Shaker Heights, Ohio
Application September 24, 1952, Serial No. 247,991
2 Claims. (Cl. 137—505.12)



1. A mulit-stage gas pressure reduction regulator comprising a unitary body provided with an intermediate transverse wall forming therewithin an initial chamber and a second chamber, said second chamber being provided with a gas discharge outlet, a flexible diaphragm mounted transversely within each of said chambers, said casing body and said transverse wall being formed with a duct through which gas may flow from said initial chamber to said second chamber, said transverse wall having a valve opening between said duct and said second chamber, valve means for said valve opening, said valve means being connected to the diaphragm in said second chamber, the wall of said initial chamber that is opposite to said last-named valve opening having an inlet opening with a valve seat, a valve therefor operatively connected to the diaphragm in said initial chamber, spring means effective through the diaphragm in said initial chamber

for normally biasing said inlet valve towards its closed position, means between said transverse wall and the diaphragm in said initial chamber for flexing said diaphragm in opposition to said spring means and having manipulating means therefor extending to the outside of said initial chamber, said diaphragm-flexing means being slidably mounted upon said transverse wall.

---

2,770,253
GAS VALVE
Charles C. Lasser, Chicago, Ill., assignor of one-fourth to Philip S. Harper and one-fourth to Carolyn L. Harper, Chicago, Ill. (as individuals), one-fourth to Harris Trust and Savings Bank, Chicago, Ill. (an Illinois banking corporation), trustee for a trust known as The Philip S. Harper Trust, and one-fourth to Harris Trust and Savings Bank, Chicago, Ill. (an Illinois banking corporation), trustee for a trust known as The Carolyn L. Harper Trust
Application March 18, 1952, Serial No. 277,219
12 Claims. (Cl. 137—625.32)

1. A valve for supplying high and low quantities of gas to a burner, including a valve body having a valve chamber and a pair of burner outlet passageways and a gas inlet passageway, and a valve element rotatably mounted in said chamber, and said body and element including a system of passageways for controlling the flow of gas from said inlet to said outlet passageways, said system comprising axial and transverse passageways in said element connecting said inlet passageway to one of said outlet passageways in different angular ranges of said rotatable valve element and also to the other of said outlet passageways in one of said ranges and variably controlling the supply of gas to said outlet passageways, and other passageway defining means including a single gas flow predetermining restricting orifice effectively at the outlet side of the axial passageway of said rotatable valve element for connecting said inlet passageway to said one outlet passageway in said different ranges and supplying said one outlet passageway with a small quantity of gas predeterminable by said orifice in each of said different ranges.

---

2,770,254
CARBURETOR METERING VALVE
Harry G. Bolton, Decatur, Ill., assignor to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois
Application July 10, 1951, Serial No. 235,951
2 Claims. (Cl. 137—625.48)

1. A metering valve assembly for a carburetor having a fuel feeding nozzle associated therewith and a reservoir for fuel, said metering valve assembly including means defining a valve chamber having one end thereof adapted for communication with said reservoir, and circumferentially spaced ports formed in said chamber and spaced from said one end, a sleeve valve journalled in said chamber and having a conically tapered metering surface formed thereon adjacent to said one end for controlling the flow of fuel through said chamber to said ports, said tapered metering surface and said adjacent end wall of said chamber defining an annular passage of generally triangular cross-section, the wider end of which passage adapted for communication with said reservoir and the narrower end whereof may be placed in communication simultaneously and equally with each of said ports, and means for adjusting the position of said valving surface with respect to said ports including a valve stem surrounded by said sleeve and spaced therefrom, said stem having an enlarged portion provided with screw threads and resilient means for holding said sleeve valve on said valve stem by pressure on the ends of said sleeve valve, whereby said sleeve valve may be moved axially by rotation of said screw threaded portion and said sleeve valve is laterally movable relative to said stem.

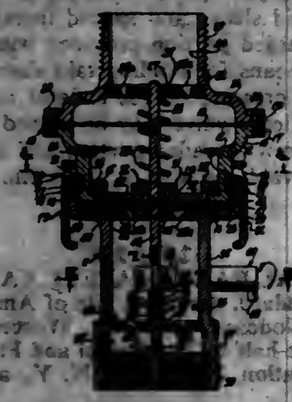
2,770,255
DUAL-RANGE SAFETY VALVE
Robert H. Goddard, deceased, late of Annapolis, Md., by Esther C. Goddard, executrix, Worcester, Mass., assignor of one-half to The Daniel and Florence Guggenheim Foundation, New York, N. Y., a corporation of New York
Application August 16, 1952, Serial No. 304,787
1 Claim. (Cl. 137—629)



A dual range safety valve comprising a relief valve, a valve-closing member, a light spring to apply relatively light closing pressure to said member, additional fluid pressure-operated means to apply a relatively much higher closing pressure to said member, a heavier spring urging said additional means to inoperative position, predetermined clearance being provided between said additional means and said closing member, and means for adjusting the heavier spring pressure while maintaining the predetermined clearance unchanged, and which latter means comprises screw-threaded pressure-adjusting means for said heavier spring and screw-threaded clearance adjusting means for said valve-closing member, and said two screw-threaded means being mechanically interconnected and of the same hand and pitch whereby they rotate simultaneously and equally when said heavier spring is adjusted.

---

2,770,256
VALVED COUPLING
John T. Krupp, Port Washington, N. Y.
Application July 19, 1951, Serial No. 237,295
1 Claim. (Cl. 137—614.2)

In a separable coupling, a female member having a passage therethrough, a passage of larger diameter communicating with said passage, and forming a shoulder therebetween, a sealing gasket on said shoulder, a valve seat formed in said member adjacent to said gasket, a valve cooperating with said seat and having a stem extending axially in said first passage, cam means comprising cams

rotatably carried in opposed clearance slots formed in the walls of said second passage, each of said cams having an actuating lever formed integral therewith, valve opening means comprising a shaft extending through the wall of said first passage and operatively connected to said cams, said shaft carrying an actuating lever adapted to rotate on a plane substantially tangent to the outer edge of at least one of said cam actuating levers when the latter is in an actuated position, a male member having a tubular portion adapted to fit into said second passage, said male member also having a seating face on the end thereof adapted to engage and form fluid tight seal with said gasket when said levers are actuated, a second valve

seat formed in said male member adjacent to said seating face, a second valve means cooperating with said second seat and having a stem reciprocally movable on the axis of said second member, spring means embracing said stem and urging second valve onto its seat, and an annular groove formed on the exterior of said male member adjacent to said seating face and adapted to be engaged by said cam means when said tubular portion is positioned in said second passage with said end in contact with said gasket, both said valve means normally contacting each other when said members are secured together, thereby minimizing any loss of fluid when said members are separated and causing them to move in unison to open positions when said valve opening means is actuated.

**PNEUMATIC TOGGLE DEVICES PROVIDED WITH ADJUSTABLE FULCRUMS**

**Alfred A. Markson, Pittsburgh, Pa., assignor to Hagan Corporation, Pittsburgh, Pa., a corporation of Pennsylvania**

**Application November 7, 1955, Serial No. 545,231**

**6 Claims. (Cl. 137—620)**

1. A pneumatic toggle device comprising a beam, a double acting fulcrum for said beam, a valve actuated by said beam from zero to maximum output positions and vice versa, a pressure receiving member having a chamber and a diaphragm responsive to pressure in said chamber, means connecting said chamber to the output of said valve, means connecting said diaphragm to said beam at a distance $L_1$ from the fulcrum, a second pressure receiving member having a pressure receiving chamber and a diaphragm responsive to pressure in said chamber, the diaphragm of said second chamber being connected to exert a force on said beam at a distance $L_2$ from the fulcrum, the turning moments of the said diaphragms being in the same direction about the fulcrum, said adjustable yielding means in the chamber of said second pressure receiving member for exerting a predetermined force in opposition to the force of pressure on said diaphragm, the second chamber being disposed to receive a variable pressure whereby, when the force of said variable pressure on said second diaphragm is less than the opposing force of said yielding means, the valve is actuated to one of its output positions and when the force of the pressure exceeds that yielding means force, the valve is actuated to its other pressure output position.

**2,770,258**

**DIFFERENTIAL PRESSURE RESPONSIVE ASSEMBLY**

**Hoel L. Bowditch, Foxboro, Mass., assignor to The Foxboro Company, Foxboro, Mass., a corporation of Massachusetts**

**Application September 20, 1954, Serial No. 457,161**

**8 Claims. (Cl. 137—787)**

1. In differential pressure responsive apparatus, in combination, a casing, a differential pressure responsive unit in said casing, said unit comprising a metal back-up plate and a pair of resilient metal diaphragms secured at their peripheries to opposite sides of said plate to form a hermetically sealed unit, said back-up plate having a passage therethrough establishing communication between said diaphragms and a flexure member extending around the periphery of said unit and interconnecting the periphery of said unit and said casing, whereby said unit is supported in said casing through said flexure member and is movable as a unit in response to over-range differential pressures applied thereacross but returns to its original position upon equalization of the differential pressure.

**EXPANSION JOINT AND APPARATUS FOR AND METHOD OF MAKING SAME**

**Blake P. Zallea, Wilmington, Del.**

**Application July 12, 1952, Serial No. 298,572**

**2 Claims. (Cl. 138—42)**

1. In an expansion joint for a pipe line or the like, a unitary bellows element of hollow toroidal shape formed of a tubular blank to have permanently formed an annular central wall part of generally ovaloid shape in transverse section, said ovaloid part being concave to any internal pressure to which the joint may be subjected and having major and minor axes of which the major axis extends normal to the axis of said bellows element, said annular central wall part being transversely curved through an arc substantially greater than 180 degrees

and terminating at opposite sides thereof in a pair of axially spaced annular side wall parts which define therebetween a relatively narrow opening extending circumferentially about the annular base of said central wall part, and side wall parts being each similarly curved reversely throughout with respect to the curvature of said central part and thus convex to said internal pressure, the reversely curved side wall parts providing respectively on opposite sides of the central wall part of the bellows element a pair of oppositely presenting annular indentations equally spaced radially from the central longitudinal axis of the bellows element, the said indentations being each of a same radius substantially less than that of any portion of the central wall part, the opposite sides of said annular central wall part of the bellows element and said reversely curved side wall parts thereof being symmetrically disposed with reference to the median plane of the element extending normal to the axis thereof, said reversely curved side wall parts being respectively provided with axially alined tubular extremities of equal diameter at opposite sides of said main central wall part, means snugly fitted in the indentations formed by said reversely curved side wall parts of said bellows element and extending axially from opposite sides thereof in embracing relation to said tubular extremities for reinforcing and supporting said side wall parts against deformation under the influence of said internal pressure, while permitting said central part to flex freely upon expansion and contraction of said joint, and means for securing said reinforcing and supporting means respectively to said tubular extensions, said securing means being spaced axially from said reversely curved side wall parts, said bellows element being further characterized in that the transversely curved central wall part and the reversely curved side wall parts thereof are formed of continuously homogeneous metal entirely free of any circumferentially extending welds.

**SELF-ALINING PROTECTIVE PLUG FOR TUBINGS, HOSE LINES, THREADED OPENINGS, ETC.**

**Harold P. Shanaman, Tonawanda, N. Y.**

**Application August 19, 1954, Serial No. 450,899**

**3 Claims. (Cl. 138—89)**

2. In combination with an object having an opening provided with a standard screw-thread and a plug-contact seat a distance from the outer end of said opening, a cylindrical closure plug having a thread rolled into its peripheral wall pitched to the pitch of said standard screw-thread and having a seat-contacting portion, said screw-threads being sized relatively to permit spinning inward movement of said closure plug into said opening until in contact with said plug-contact seat, said rolled screw-thread being deformable under tightening action of said closure plug into said opening so as to lock said plug in said opening.

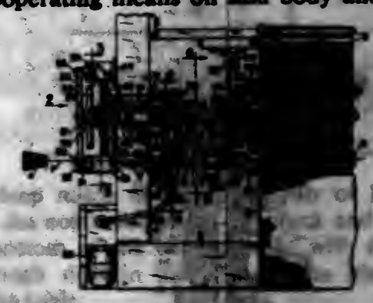
**2,770,261**



**LOOM OPERATING WITH STATIONARY WEFT SUPPLY**

**Richard G. Tiller, Worcester, Mass., assignor to Crompton & Knowles Loom Works, Worcester, Mass., a corporation of Massachusetts**

**Application May 27, 1953, Serial No. 357,736**

**13 Claims. (Cl. 139—126)**

1. In a loom operating with a stationary weft supply, a thread guide from which projects the end of a thread drawn from said weft supply, a shuttle supported by the loom adjacent to said guide comprising a body substantially aligned with said end of the thread, thread gripper jaws on the shuttle adjacent to said guide in open non-gripping relation, said jaws being projectible lengthwise with respect to said body toward said guide, actuating means to project said jaws from said body toward said guide, cooperating means on said body and jaws causing

the latter to move from said open non-gripping relation to closed gripping relation to grip said end of said thread when said actuating means projects said jaws toward said guide, the latter being formed with a hollow bore for the thread, and pneumatic means to cause compressed air to pass through and out of said bore toward the shuttle and maintain said end of the thread in position to be gripped by said jaws.

**MACHINE FOR FORMING SPRING-WIRE INTO ZIG-ZAG MATERIAL AND METHODS OF FORMING ZIG-ZAG SPRING MATERIAL**

**Joseph Gessel, Jersey City, N. J., assignor to Springs, Inc., a corporation of New Jersey**

**Application June 17, 1952, Serial No. 294,001**

**6 Claims. (Cl. 140—71)**

1. In a machine for forming sprisg wire into zig-zag spring material, a support, a pair of centrally-disposed circular and grooved initial-bending wire-forming mandrels mounted on fixed axes on said support and having their peripheries arranged to provide a wire-feeding channel disposed therebetween to guide a section of wire, the wire being in contact with the peripheral surfaces of said initial wire forming mandrels, in combination with loop-forming means including a turret member movable in the arc of a circle about said centrally-disposed mandrels, and a pair of round wire-forming elements mounted on and carried by said turret to move about said centrally-positioned mandrels, and means for feeding a spring wire through said wire-feeding channel.

**2,770,263**

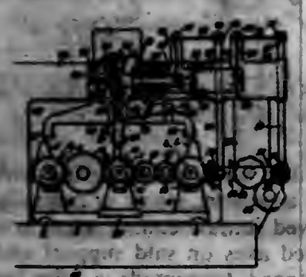
**METHOD AND APPARATUS FOR FILLING CONTAINERS WITH A LIQUID**

**Rudolph H. Brodbeck, Baltimore, Md., assignor to Crown Cork & Seal Company, Inc., Baltimore, Md., a corporation of New York**

**Application March 3, 1954, Serial No. 413,819**

**25 Claims. (Cl. 141—6)**

1. In a container filling machine, a filling head element, a container supporting element arranged to move the



coöperate into and out of sealing engagement with the filling head element, said filling head element including a liquid flow nozzle and a container venting means arranged to be closed by rise of liquid in the container, a displacement member depending from said filling head element and adapted to be received within the container, said displacement member being adjustable whereby height of

fill of liquid in the container may be varied, and valve means on said filling head element, said valve means being operated to place said liquid flow nozzle in communication with said container venting means after the container has been filled whereby liquid in said liquid flow nozzle will flow into the container as the container is being removed from said filling head element.

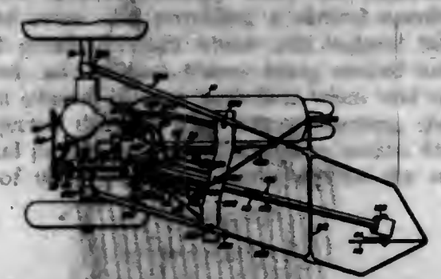
2,770,264
**MACHINES FOR THE MANUFACTURE OF SHOE LASTS AND SIMILAR MOULDED BODIES**
Carl Hjalmar Eklund, Stockholm, Sweden
Application April 14, 1953, Serial No. 348,677
8 Claims. (Cl. 142—15)

1. A machine for the manufacture of shoe lasts comprising a rotary model last holder, a rotary last blank holder, a model follower, a cutting tool holder, a primary width grading mechanism operated by the model follower, a secondary width grading mechanism connected with the primary width grading mechanism and operating to impart to the cutting tool holder an additional motion increment superimposed on the motion imparted by the primary width grading mechanism, said secondary width grading mechanism comprising a rotary member adapted to rotate in synchronism with the last blank holder, an actuating member in operative engagement with the primary width grading mechanism, and means for transforming the movement of said rotary member into an oscillating movement of said actuating member, means for feeding the last blank holder lengthwise, and means actuated by said feeding means for continuously changing the oscillation amplitude of said actuating member.

2,770,265
**COMBINATION GUIDE AND PORTABLE SUPPORT FOR POWER SAWS**
Leon J. Peterson, Albany, Ga.
Application July 28, 1953, Serial No. 370,719
3 Claims. (Cl. 143—6)



1. A work surface for portable power operated hand saws, which is adapted to be placed on a support, and comprises an arcuate front section having an arcuate front edge, and a straight rear edge, angular calibrations along the arcuate front edge, a rear rectangular work surface section defining a continuation of the arcuate front section but being of less length than the front section and having a straight forward end and a straight rear end, the forward end engaging the straight rear edge of the front section in even and level engagement therewith for providing with the front section a continuous and uninterrupted flat work surface, locking means detachably interlocking the rear section to the front section, a power-operated hand saw carriage track extending across both the rear section and the front section, the said rear rectangular section having a rear edge parallel to the rear straight edge of the arcuate front section, a beam mounted on the rear straight end of the rectangular section, means pivotally attaching the carriage track to the rear edge of the rear rectangular section centrally thereof for enabling angular rotation of the carriage track relative to the rear and front sections for sawing a workpiece at a known selected angle indicated by the calibrations on the said arcuate front edge, the pivotally attaching means comprising a depending cylinder having an upper end secured to the beam, a pivot shaft depending from the rear end of the carriage track member and receivable in the cylinder, the cylinder having a substantially closed bottom end but provided with an opening therethrough, a threaded rod extending through the bottom end of the cylinder, a threaded nut mounted in the cylinder in threaded engagement with the rod, the rod having an operating head for effecting elevation of the track member, adjustable roller track supporting means engagable with the calibrated arcuate front edge of the front section, a substantially V-shaped angle marker carried by the carriage track registering with the calibrations, locking means for releasably locking the carriage track to the arcuate front edge of the front section at a selected angular adjustment, and an adjustable fence guide structure mounted on the rectangular rear section of the work surface for use when a saw mounted on the carriage track is being employed for ripping, plowing and rabbeting operations, selectively, on a workpiece, and as a guide when the saw is being used in cross-cutting a workpiece at various angles.

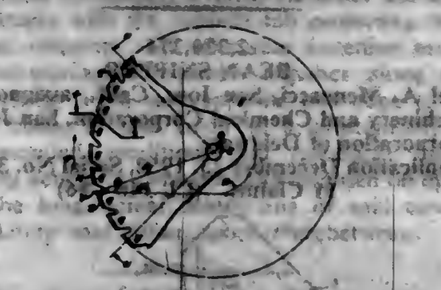
2,770,266
**HYDRAULIC LIFT FOR THE SAW BOOM OF TRACTOR OPERATED SAW**
Roy C. Wyss, Lawrence, Ill.
Application April 7, 1955, Serial No. 499,933
6 Claims. (Cl. 143—43)



1. In a tractor operated rotary cutting tool, the combination with a tool carrying beam alongside the tractor having a rear end pivoted on said tractor for vertical swinging of the boom, a vertical arcuate guide on said tractor, and an annular carriage for said boom encircling the boom and slidably mounted in said guide to extend in a vertical plane laterally from the tractor, of hydraulic

lift means for said carriage comprising a pressure responsive cylinder mounted for vertical movement on the tractor, and cable and pulley means operative by downward movement of the cylinder to lift said carriage at diametrically opposite sides thereof.

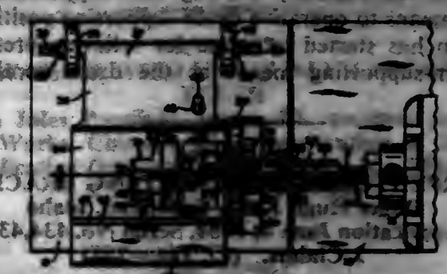
2,770,267
**ALL PURPOSE SAW BLADE**
Arthur G. Edmister, Sacramento, Calif.
Application January 5, 1954, Serial No. 402,325
1 Claim. (Cl. 143—133)

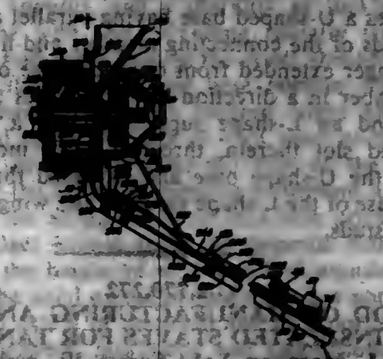
A saw blade comprising a circular plate of predetermined diameter adapted to be mounted on a rotatable saw arbor, and a plurality of teeth each having substantially identical root and marginal dimensions and being separated by a gullet of substantially uniform size, each of said teeth having a root dimension greater in extent than the height thereof and inclining forwardly in the direction of rotation of said blade to form a hook angle defined by the pitch line of said tooth and a hook line tangent with an imaginary circle having a diameter substantially one-third said predetermined diameter, said plurality of teeth being disposed in a series of recurring groups, each group comprising a first set of three teeth each having its front edge and upper margin beveled toward one side of said blade, and a second set of three teeth each having its front edge and upper margin beveled toward the other side of said blade, said first and second sets being separated by a square-faced single tooth beveled equally on its upper margin toward each side of said blade to present a centrally disposed triangular outline over its cutting area, said first set of three teeth having an overhang toward said one side of said blade and said second set of three teeth having an overhang toward said other side of said blade.



---

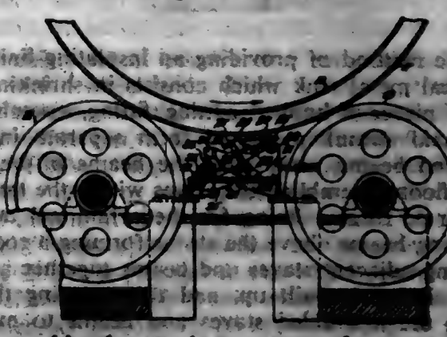
2,770,268
**MACHINE FOR TRIMMING THE FINGER PLATE OF A PIANO KEY**
Herbert B. Gibson, Williamsville, Mass.
Application March 6, 1953, Serial No. 340,604
6 Claims. (Cl. 144—3)

1. In a machine of the class described, a base, a cutter journaled on the base, a table overlying the base and hinged thereto for raising and lowering movements, a supporting block resting on the table, a screw securing



the block to the table, a channel in the block, a guide plate extending longitudinally through the channel perpendicular to the table for directing work to the cutter, said guide plate having in its lower longitudinal edge portion a deep notch to provide a pair of legs, said guide plate at the notch straddling the block and resting thereon at the bottom of the channel, and with the legs extending through slots in the ends of the block and into a slot in the table.

---



2,770,269
**POWER SCREW DRIVER**
Leonard E. Austin, Chicago, Ill., assignor to Illinois Tool Works, Chicago, Ill., a corporation of Illinois
Application January 12, 1951, Serial No. 206,804
23 Claims. (Cl. 144—32)

6. The combination comprising a powered fastener applying tool having a magazine for feeding fastening elements into driving position, a hopper for receiving a heterogeneous mass of said fasteners, a feed chute, means for feeding fasteners in predetermined orientation from said hopper to said feed chute, said feed chute having a discharge end adapted for cooperative engagement with said magazine, and escapement mechanism on said chute operable by cooperative engagement of said magazine and said chute to discharge a predetermined number of fasteners from said feed chute into said magazine.

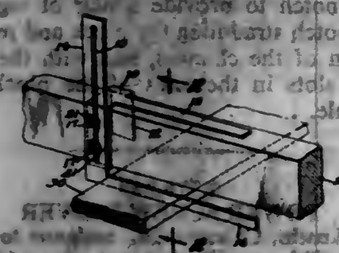
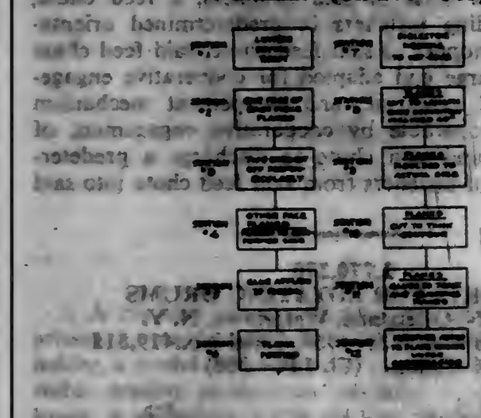
**SUPPORTS FOR ROTATING DRUMS**
Peter N. Otterlund, Watertown, N. Y.
Application March 30, 1954, Serial No. 419,815
6 Claims. (Cl. 144—288)



1. In combination, a drum, means for rotatably supporting said drum, means for rotating the drum, and sup-

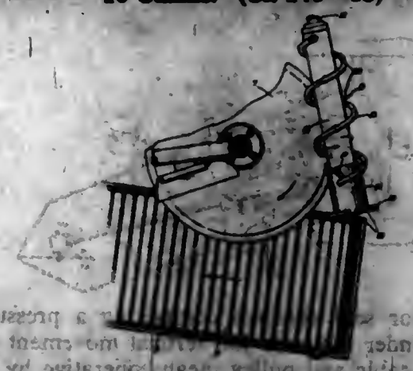
pneumatic drum-supporting means normally disposed in inoperative position when the drum is at rest, and means controlled in its operation by the means for rotating the drum for automatically moving said supplemental supporting means to operative drum-supporting position after the drum has started to rotate for relieving pressure on the drum-supporting means as the drum continues to rotate.

---



2,770,271
**CARPENTER'S BOARD HOLDING BRACKET**
Roger Hugh Kent, Sandpoint, Idaho
Application June 4, 1954, Serial No. 434,434
2 Claims. (Cl. 144—297)

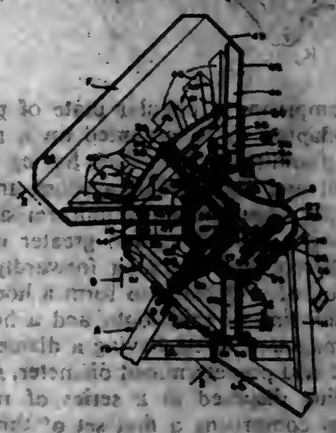
2. In a board retaining bracket, the combination which comprises a U-shaped base having parallel arms extended from ends of the connecting member and having an elongated finger extended from one side edge of the connecting member in a direction at right angles to that of said arms, and an L-shape support having a base with an elongated slot therein, threaded studs mounted in one arm of the U-shape base and extended through the slot in the base of the L-shape support, and wing nuts threaded on said studs.



---

2,770,272
**METHOD OF MANUFACTURING AND INSTALLING INSULATED STAVES FOR TANK LINING**
Willard L. Morrison, Lake Forest, Ill., assignor to Union Stock Yards and Transit Company of Chicago, Chicago, Ill., a corporation of Illinois
Application June 12, 1953, Serial No. 361,430
4 Claims. (Cl. 144—309)

1. The method of providing an insulating lining for a cylindrical metal tank which consists in shrinking a plurality of pieces of lumber, cutting, fitting, assembling and gluing said shrunk pieces to form separate interfitting staves and beams, assembling the beams in the tank to form a floor, assembling the staves within the tank above the floor to form a lining for the cylindrical tank wall, assembling beams above the staves forming a roof lining, cementing adjacent staves and beams together as the insulating lining is built up, and then causing the wood forming the assembled staves and beams to expand to exert a tension on the tank walls with resultant compression of the wood lining.



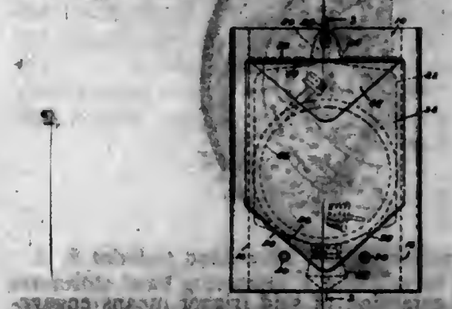
2,770,273
**BEET IMPELLING DEVICE**
Lewis Wallace Schmidt, Rio Vista, Calif.
Application April 29, 1953, Serial No. 351,776
10 Claims. (Cl. 146—85)

1. In a beet harvester, a conveyor, a driven beet topping and supporting disc mounted with a peripheral portion overhanging the conveyor, a driven feed auger above the disc in position to deflect supported beets to and for discharge from said peripheral portion, and means on the auger operative to strike beets discharging from said peripheral portion and to impart a throw to said struck beets generally lengthwise of the conveyor.

---

2,770,274
**BEAN SNIPPER**
Samuel A. Mencacci, San Jose, Calif., assignor to Food Machinery and Chemical Corporation, San Jose, Calif., a corporation of Delaware
Application December 23, 1952, Serial No. 327,515
11 Claims. (Cl. 146—86)

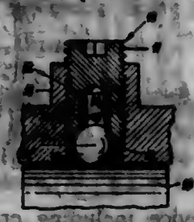
2. A bean snipping mechanism comprising a pair of continuously rotating truncated conical carriers mounted one above the other for rotation about axes at right angles to each other, the conical surfaces of said carriers being substantially tangent to each other along a horizontal line common to both, each of said carriers having pockets arranged peripherally thereof and adapted to register successively with those of the other on rotation of said carriers, means operably connected to said carriers for continuously rotating them in unison, and snipping means mounted across pockets of said carriers.



---

2,770,[illegible]
**HOT WATER BOTTLE COVER**
Application [illegible]
2 Claims. (Cl. [illegible])

1. A cover for a hot water bottle of the type comprising a generally flat, flexible container of rectangular shape having a filling spout projecting from one end and a support tab projecting from the other end, said



cover having front and rear fabric panels of generally rectangular shape secured together along their side edges and dimensioned to receive a hot water bottle therebetween, means generally closing one end of said cover along a line spaced inwardly from the adjacent end edge of the cover and providing a central opening between said panels through which said support tab may be projected, said closure means being spaced inwardly of said end edge a distance such that when said support tab is projected through said central opening, the portions of said panels between said closure means and said end edge of the cover substantially overlie the support

tab, the extent of said cover between said closure means and the opposite end edge of the cover being sufficient to substantially completely overlie the water bottle when inserted therein with the support tab projecting through said central opening, and releasable fastening members for interconnecting said panels together along a line spaced inwardly from said opposite end edge to retain the water bottle in said cover in a substantially completely concealed condition, said releasable fastening means being generally symmetrically disposed on opposite sides of the longitudinal center line of said cover for accommodating said filling spout therebetween.

---

2,770,276
**SET SCREW WITH BALL EXPANDER LOCKING MEANS**
Reuben Broder, Brooklyn, N. Y.
Application April 17, 1952, Serial No. 282,810
3 Claims. (Cl. 151—31)

3. In a bodily intact radially expandable self-locking screw, comprising a self-contained two-member interengaged unitary structure, said expandable screw having a centrally positioned elongated opening terminating in upper and lower cylindrical portions at opposite ends thereof, said screw having a convex section connecting said cylindrical portions, said lower cylindrical portion being of larger diameter than said upper cylindrical portion, said convex shaped section connecting said cylindrical portions, a ball mounted in said lower cylindrical portion having a clearance space thereabove, operatively connected to said screw and in contacting relation with said ball mouth shaped section at a single plane, the center of said ball being positioned slightly inward of the lower end face of said screw, thus permitting deformation of the outer edge defining said lower opening of said screw and retaining said ball against disengagement from said screw, whereby when said screw is forcibly threaded against a part to be locked by said screw, said ball is tensioned in a direction inwardly of said opening, causing radial expansion of the bodily intact screw threads at the lower portion of said screw and a wedging action against the mating threads, preventing disengagement of said screw from the part being locked, when subjected to vibrations.

---

2,770,277
**LOCK WASHER WITH UNEQUALLY PROJECTING TEETH**
Ouzjem Jules Poupitch, Illinois, Ill., assignor to Illinois Tool Works, Chicago, Ill., a corporation of Illinois
Application October 23, 1951, Serial No. 252,589
2 Claims. (Cl. 151—35)

1. A lock washer of sheet metal stock adapted to be retained in preassembled relationship with a rotary fastener having a clamping surface with an annular recess therein; and said lock washer comprising an inner rigid body portion in the form of an inwardly inclined continuous uninterrupted conoidal annulus substantially nondeformable during ordinary use, a narrow uninterrupted annular base portion projecting from the larger end of said conoidal annulus, and a plurality of locking teeth formed integral with and extending radially from said base portion, said teeth having the roots thereof spaced apart around the edge of said base portion and being oppositely twisted to present locking edges projecting axially beyond opposite sides of said base portion, the locking edges of the teeth on the side of the washer opposite from the conoidal annulus projecting a greater distance from the adjacent side of said base portion than the locking edges extend from the opposite side of the base portion, the height of said conoidal annulus being greater than the axial extent of said teeth but not greater than the radial extent of the teeth and base portion so as to provide a properly positioned and proportioned inner washer retaining conoidal surface in the vicinity of the free margin of smaller diameter oppositely disposed from said base portion.

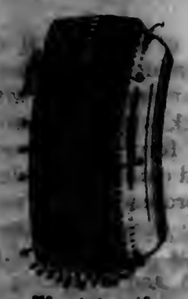
2,770,278
**VEHICLE WHEEL CONSTRUCTION**
Robert J. Dillon, San Francisco, Calif.
Application February 18, 1952, Serial No. 272,078
9 Claims. (Cl. 152—41)

1. A vehicle wheel construction comprising, in combination with a wheel brake drum, a unitary structure removably mounted on the wheel brake drum and consisting of a wheel rim, a first continuous circular element having a relatively large dished portion for receiving the wheel brake drum as well as having a plurality of small openings therein at circumferentially spaced intervals adjacent said large dished portion for receiving lugs for attaching said first element to the wheel drum, a second circular element secured to said wheel rim, a first annular rubber member bonded on its opposite faces to said first and second circular elements intermediate said wheel rim and the wheel brake drum, a third circular element se-

cured to said wheel rim and disposed adjacent to said second circular element, a fourth circular element secured to said first element adjacent to the wheel brake drum, a second annular rubber member bonded on its opposite faces to said third and said fourth elements and disposed in juxtaposition with respect to said first annular rubber member, and a pair of thrust rings secured to said wheel rim and disposed outside of and in juxtaposition to said first and fourth circular elements.



2,770,279

**VEHICLE TIRE**

John O. Harrison, Independence, Mo., assignor to Dealers Tire Service, Inc., Kansas City, Mo., a corporation of Missouri

Application January 4, 1954, Serial No. 401,826

1 Claim. (Cl. 152—209)

A tire having a resilient tread provided with a central traction portion extending circumferentially of the tire and defined by laterally spaced apart annular grooves extending circumferentially of the tire and interconnected by circumferentially spaced apart transverse primary grooves dividing said central portion into spaced apart main lugs, said main lugs having secondary transverse grooves of less width than the transverse primary grooves, with side faces of said secondary transverse grooves spaced from each other to promote resiliency of portions of the main lugs between said secondary transverse grooves and providing working clearance for movement of said portions under weight applied to the tire when the tire is in use, said tread also having two spaced apart annular grooves extending circumferentially of the tire and defining spaced annular traction portions on respective sides of the central traction portion, said spaced, annular traction portions having spaced apart angularly extending primary grooves connecting said annular grooves, with said last named primary grooves on one side of said central traction portion extending in the same direction circumferentially of the tire as said angularly extending primary grooves on the other side of said central portion to form main lugs extending at the same angle as the said angularly extending primary grooves, said angularly extending main lugs having spaced apart angularly extending secondary grooves of less width than said angularly extending primary grooves and having side faces thereof spaced apart to provide working clearance for portions of the lugs between the angularly extending secondary grooves, said transverse primary grooves and said angularly extending primary grooves cooperating with the annular grooves to form continuous passages for escape of any air when the tire flattens under said weight and said resiliency of the portions of the lugs between said secondary grooves providing for self cleansing of said grooves when the tire turns through said flattened position.

2,770,280

**ANTI-SKID APPARATUS FOR MOTOR VEHICLES**

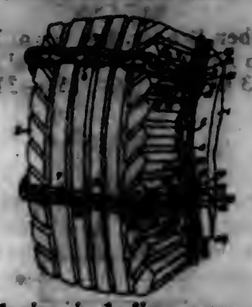
Adam J. Pritz and Edward J. Hoffman, Pittsburgh, Pa.

Application February 15, 1956, Serial No. 565,599

9 Claims. (Cl. 152—216)

1. An anti-skid apparatus for intermittent use in combination with a driving wheel and tire assembly of a motor vehicle comprising a rotatable ring spaced inboard of said wheel for rotation coaxially therewith in a plane parallel thereto, a plurality of resiliently pivotally mounted cleat elements carried at spaced points by said ring extending radially therefrom and outwardly transversely to the periphery of said tire and normally spaced therefrom, pivotal trigger means carried by said ring, actuating means

on the outboard extension of said trigger means engageable with said wheel and tire assembly for securing said ring therewith, securing means for said ring on the inboard extension of said trigger means, latch means carried by said motor vehicle adapted to releasably engage said securing means and displace said actuating means from engagement with said wheel and tire assembly whereby said ring is non-rotatably retained.



2,770,281

**TIRE CHAIN FOR TRACTORS AND HEAVY VEHICLES**

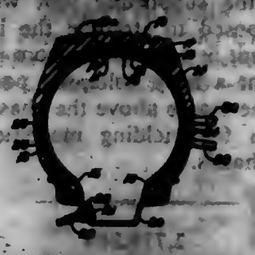
Glen M. Eddy, Kansas City, Mo., assignor to Roll-O-Matic Chain Company, Kansas City, Mo., a corporation of Missouri

Application February 5, 1954, Serial No. 408,319

1 Claim. (Cl. 152—241)

An anti-skid device including cross and carrier side chain members each composed of a series of interconnected links, the links of the carrier side members having side bars spaced apart and providing an opening therebetween, and swivel units connecting endmost links of the cross members with links of the carrier side members, each of said swivel units including a shank extending through an opening between the side bars of a link of the carrier side members and having an axis of rotation, a head integral with one end of said shank and of larger diameter than the space between said side bars to provide an annular shoulder with opposite diametrical portions contacting the respective side bars when the shank turns about its axis within said opening between the bars of the link under rolling movement of the cross members, a hook integral with the other end of said shank and having an entrance way for passing the endmost link of a cross member, a roller slidable on the shank to close said entrance way to the hook, a washer on the shank engaging opposite sides of said bars of the link of said side members, and a spring on said shank having one end engaging the roller and the other engaging the washer to

retain yieldingly the shoulder of said head in direct swivelling contact with the side bars of the link and the roller closing the entrance way to the hook.



2,770,282

**TUBELESS PNEUMATIC TIRE**

Frank Hornak, Cleveland, Ohio, assignor to The B. F. Goodrich Company, New York, N. Y., a corporation of New York

Application February 16, 1954, Serial No. 409,291

2 Claims. (Cl. 152—330)

1. A tubeless pneumatic tire consisting of a pair of inextensible bead grommets, a plurality of reinforcing plies of closely spaced, crossed, air-conducting cords anchored to the grommets and extending radially outward from each grommet and merging with the cord plies extending outward from the other grommet to form an open-bellied hollow carcass, the innermost ply of cords having turnups extending around the bead portions and along the outside of the carcass to a zone of the bead portions destined to be radially outwardly of the rim flanges, an air-containing lining of flexible material bonded to the innermost surface of the reinforcing plies, a vulcanized rubber road-engaging tread on the crown of the reinforcing plies, flexible vulcanized rubber sidewall covers on that portion of the reinforcing plies not covered by the tread, and punctures formed in the sidewall covers without removal of rubber material, said punctures extending through the sidewall cover to vent said furnace, said punctures being held in a normally closed position by the resiliency of the sidewall cover material but opening up under sidewall flexure, said punctures as a group being spaced circumferentially about said sidewall by a distance substantially equal to the center-to-center spacing of said cords, successive punctures in the group being radially staggered.

2,770,283

**APPARATUS FOR MAKING PILE FABRIC**

Leslie A. Benton, Harrison, and Walter G. Behnke, Mount Vernon, N. Y., assignors to Alexander Smith, Incorporated, Yonkers, N. Y., a corporation of New York

Application August 19, 1955, Serial No. 529,418

8 Claims. (Cl. 154—1.1)

1. Apparatus for making pile fabric, comprising a pile forming conveyor having a series of connected links each link extending transversely across the fabric, said links having flat upper surfaces to support a sheet of pile yarn and having spaces therebetween for receiving pile loops, means feeding a sheet of pile yarns across said yarn supporting surfaces with said links spaced to permit the passage of the yarn downwardly therebetween for forming pile loops, an ejector station above said conveyor, means feeding a series of pile forming wires to said ejector station, ejector means at said station to eject said wires in succession into the space between successive links of said pile forming conveyor for thereby forcing the pile yarn into said spaces to form pile loops, means advancing said pile forming conveyor with said links closed to grip said yarn therebetween and with said flat upper surfaces forming a support for the pile yarn, means advancing a backing material to the pile yarn carried on said support, and means withdrawing said pile forming wires lengthwise from said loops after said backing has been attached to said loops.

2,770,284

**PIPELINE COATING AND WRAPPING MACHINE**

Elvin L. Mydek, Ebensburg, Pa.

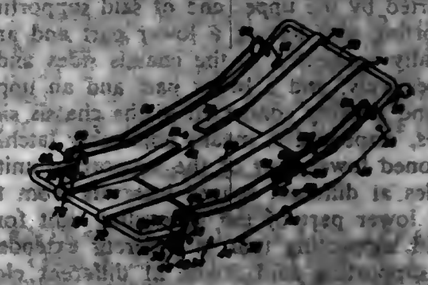
Application January 25, 1954, Serial No. 405,939

6 Claims. (Cl. 154—41)

6. In a pipeline coating and wrapping machine, a frame, a coating shoe carried by the frame and comprising an annular container having an imperforate forward wall and a perforate rearward wall, each said wall consisting of a plurality of segments flexibly secured together, and a spreading ring carried by said container and disposed in spaced adjacent relation to said perforate wall, said spreading ring having an internal diameter greater than that of said container walls, means for delivering coating liquid to said container, and means for holding the inner peripheries of said container walls in close, yieldable engagement with said pipeline comprising a cable having a loop connecting said segments, and resilient means applying tension to said cable.

2,770,285

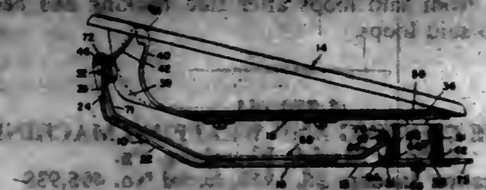
**WITHDRAWN**



2,770,286

**SELF-LEVELING SEAT STRUCTURE**

James O. Wallis, Long Beach, Calif., assignor to Ernest F. Pahl, Woodside, N. Y.



Application May 20, 1953, Serial No. 356,619

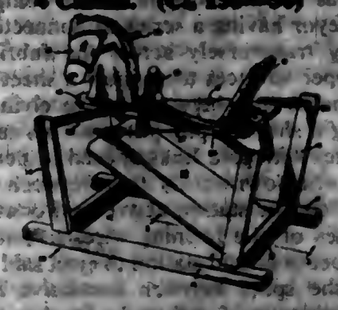
12 Claims. (Cl. 155—9)

1. A seat assembly for tractors and the like comprising a posterior-receiving seat member, guide rail means extending transversely of the front to rear direction of the seat member, and roller support means cooperative with said guide rail means for supporting said member for movement in said transverse direction relative to the support for the assembly along an arc of a circle in response to changes in angularity of the support relative to the horizontal, and means engaging the guide rails for limiting the freedom of adjustment in response to the said changes.

2,770,287
**LEVEL RIDE SEAT**
Edwin S. Christensen, Long Beach, Calif., assignor to Rupert F. Peil, Westdale, N. Y.
Application January 19, 1954, Serial No. 404,935
18 Claims. (Cl. 155—9)

1. In a level ride seat construction two superposed members, the lower member being designed to be secured to a support, the upper member being adapted to carry a sitter, and means providing a three point suspension of the upper member on the lower member, said suspension points being in substantially triangular arrangement with the apex of each triangle at the front of the seat, the apex point suspension being a fixed yielding and resilient pivot means, and the two remaining points of suspension comprising spaced rollers, whereby the rear of the upper member may swing upwardly and laterally in either direction with respect to the lower member.

2,770,288
**COMBINATION HIGH CHAIR AND VEHICLE**
Edward S. Peyton, Miami, Fla., assignor of fifty percent to Joseph F. Miami, Borough of Hollidaysburg, Blair County, Pa.
Application October 30, 1953, Serial No. 389,279
4 Claims. (Cl. 155—17)



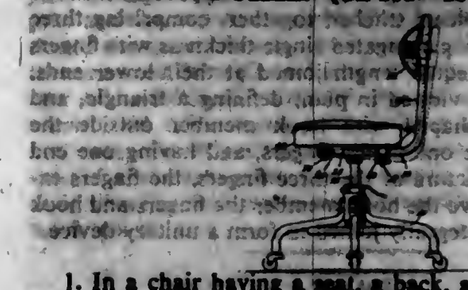
1. A combination vehicle of the character described comprising a wheeled chassis having spaced sides, an extensible supporting unit comprising a system of jointed levers having a lower end connected to the chassis sides, a seat supporting frame having spaced sides connected to and supported by the upper end of said supporting unit, said supporting unit having a lower part and an upper part pivotally connected to the chassis sides and frame sides, respectively, and a lower part and an upper part pivotally and slidably connected to the chassis sides and frame sides, respectively, means adjustably latching said last mentioned lower part of the supporting unit to the chassis sides at different spaced intervals from the first mentioned lower part of the supporting unit for maintaining said supporting unit in different extended positions for supporting said frame at different elevations above the chassis, a seat mounted on and supported by the frame sides, a back rest connected to and supported by the frame sides and extending upwardly from the rear end of said seat, said supporting unit including lower pairs of levers, a lower shaft pivotally connecting the individual levers of said pairs of lower levers in crossed relation, upper pairs of levers, an upper shaft pivotally connecting the individual levers of said upper pairs of levers in crossed relation, said last mentioned lower part of the lower end of said supporting unit being slidable relatively to the chassis and away from said first mentioned lower part of the supporting unit when said latch means is released for completely collapsing the supporting unit and to position said frame immediately above and adjacent the chassis, hanger members swingably suspended from said upper shaft of the supporting unit, coil springs supported on said hanger members, and positioning means connected to said hanger members and adjustably connected to a portion of the jointed lever system for locating said hanger members to either straddle said lower shaft or to pass to one side thereof when the supporting unit is moved toward a fully collapsed position, said springs engaging between the upper and lower shafts of the supporting unit when the hanger members are disposed to straddle the lower shaft and the supporting unit is detached from the chassis and moved to adjacent a fully collapsed position for yieldably supporting the frame above the chassis in a partially extended position for yielding movement toward and away from said chassis.

2,770,289
**HOSPITAL CHAIR**
Leo McKinney, Sturtevant, Wis.
Application August 9, 1954, Serial No. 448,469
5 Claims. (Cl. 155—45)

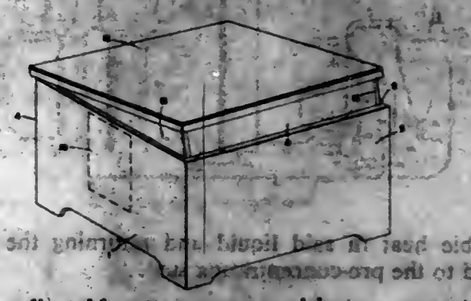
2. A convertible hospital chair comprising a wheeled framework, a shaft carried by said framework, means for rotating said shaft, a back rest pivotally attached to said framework including a pair of frame members, a body support pivotally attached to said back rest, a foot rest pivotally attached to said body support, links pivotally interconnecting said frame members and said foot rest, and a linkage connected to said shaft for adjusting the position of said back rest, said body support and said foot rest, said linkage including pairs of crank arms attached to said shaft, a pair of connecting links terminally attached to said back rest and one of said pairs of crank arms, and other connecting links terminally attached to said body support and another of said pairs of crank arms, said frame members having downwardly projecting portions to which said first recited pair of connecting links are attached and forming a quadrilateral link arrangement consisting of said body support, said foot rest, said links, and said frame members.

2,770,290
**HOBBY HORSE**
William F. Whittle, Benton, Ark.
Application November 10, 1953, Serial No. 391,236
4 Claims. (Cl. 155—99)

1. A hobby horse comprising a support member having a substantially rectangular base and spaced posts extending upwardly from each corner of the base, a seat positioned intermediate the posts, springs extending from said posts and attached to said seat, a footrest beneath the seat, said footrest comprising an elongated platform member pivotally connected at its rear extremity to said support member, and seat actuating means connected at one end to the forward portion of the footrest and at its other end to the rearward portion of the seat.

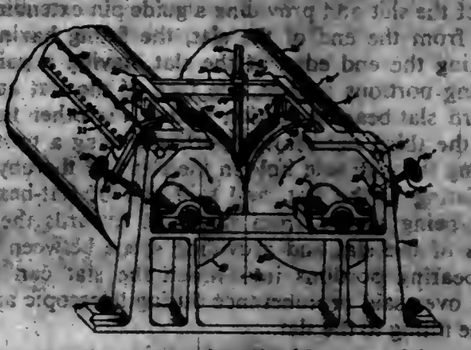


2,770,291
**HOBBY HORSE**
Sidney Forman, University City, Mo.
Application November 8, 1954, Serial No. 467,368
3 Claims. (Cl. 155—56)



1. In a riding apparatus, a base including front and rear cross bars and a longitudinal bar, an upright supporting member, means pivotally connecting said upright member to said longitudinal bar, a carrier, means pivotally connecting said carrier to said upright member, a resilient element carried by said upright member, and adapted to abut the longitudinal bar to provide a range of fore-and-aft pivotal movement of said upright member about the pivotal connection of said member with said longitudinal bar, a pair of tension springs disposed on one side of said upright member, and a second pair of tension springs disposed on the other side of said upright member, the springs of each pair having upper ends connected to the carrier, and having lower ends connected to said longitudinal bar, one spring of each pair extending downwardly and forwardly from its upper end to its lower end, and the other spring of each pair extending downwardly and rearwardly from its upper end to its lower end.

2,770,292
**SPRING-BACK CHAIR**
Bertie F. Hamilton, Columbus, Ind.; William S. Hamilton, executor of said Bertie F. Hamilton, deceased
Application September 24, 1951, Serial No. 247,969
4 Claims. (Cl. 155—157)

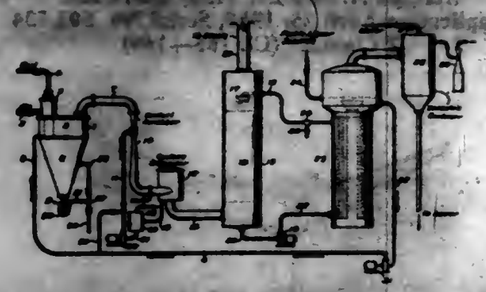


1. In a chair having a seat, a back, a back-support including a generally horizontal portion extending beneath said seat and a generally vertical portion on which said back is mounted, means for pivotally connecting the front end of said horizontal portion to said seat on a horizontal axis transverse to the seat, said means comprising a bracket secured to said seat and a removable pivot pin extending through openings in said bracket and horizontal portion said bracket having a series of openings in which said pivot pin is alternatively receivable, the openings of said series being opened apart fore-and-aft of said seat, and resilient means acting between the seat and back-support and yieldingly opposing rearward movement of the back about said pivot pin.

2,770,293
**ADJUSTABLE OTTOMAN**
Herman H. Eichorst, Hollydale, Calif.
Application April 25, 1955, Serial No. 503,534
2 Claims. (Cl. 155—169)

1. An adjustable ottoman comprising an open-topped box frame member, a cover member having downwardly extending side skirts, a face cam having a substantially parallelogram shaped cam groove secured to at least one of the sides of said frame member, a cam follower attached to the adjacent side skirt and riding in said cam groove and means for supporting the ends of said cover in more than one vertical position.

2,770,294
**APPARATUS FOR PROCESSING LIQUID MATERIAL**
Charles Frederick Fiedler, Jersey City, N. J., assignor to Colgate-Palmolive Company, Jersey City, N. J., a corporation of Delaware
Application May 14, 1954, Serial No. 429,931
6 Claims. (Cl. 159—16)



1. Apparatus for processing liquids comprising a pair of parallel, adjacent, horizontally disposed rotary drums adapted to receive in the trough between said drums liquids to be processed on the circumferential surfaces thereof, a pneumatic manifold adjacent to each end of said trough adapted to deliver a stream of gas inwardly against liquid in said trough and against the apex and adjacent walls of said trough, and a gas deflecting means disposed to retard the escape of gas from the end of said trough.

2,770,295
**CONCENTRATING PROCESS AND APPARATUS**
Louis N. Allen, Jr., West Nyack, N. Y.
Application December 5, 1952, Serial No. 324,257
7 Claims. (Cl. 159—16)

1. The process of concentrating a solution which comprises, evaporating solvent therefrom under reduced pressure in a pre-concentrating step and withdrawing the resulting solvent vapor while passing a stream of hotter recirculating liquid in heat exchange with said solution, thereby transferring thereto the heat necessary for the solvent evaporation and cooling the liquid, further concentrating the pre-concentrated solution by physically contacting the solution with hot gas, withdrawing the resulting mixture of gas and hot vapor from the concentrate, physically contacting said mixture of gas and hot vapor with the

recirculating cooled liquid to condense the vapor and recover the latent heat of condensation thereof as increased

sensible heat in said liquid and returning the resulting liquid to the pre-concentrating step.

---

2,770,296

**SLAT END GUIDE FOR VENETIAN BLINDS**

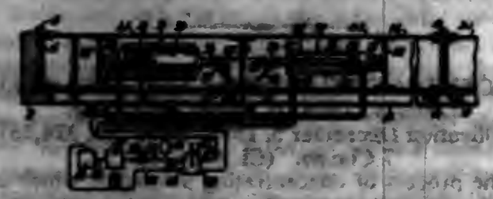
Ernst E. Bond, North Plainfield, N. J., assignor to Levelon Hardware Mfg. Corp., New York, N. Y., a corporation of New York

Application May 14, 1953, Serial No. 355,076

4 Claims. (Cl. 160—173)

1. A thin Venetian blind slat of springy sheet metal having a hole through the slat adjacent to an end thereof, a molded one-piece fitting of resilient plastic astride said end of the slat and providing a guide pin extending lengthwise from the end of the slat, the fitting having a body abutting the end edge of the slat, having a pair of slat-bearing portions against one face of the slat and having a third slat-bearing portion against the other face of the slat, the third slat-bearing portion having a protuberance passing through said hole in the slat and thereby securing the fitting to the slat, and said pair of slat-bearing portions being spaced from said hole towards the opposite edges of the slat and providing space between such two slat-bearing portions into which the slat can flex as it rides over said protuberance during telescopic application of the fitting to the slat.

---



2,770,297

**HYDRAULICALLY ACTUATED ARTICULATED MEMBERS**

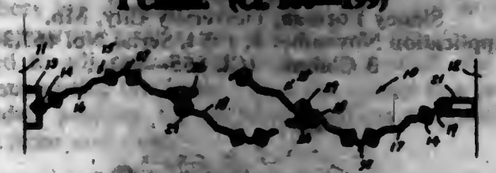
Jean Mercier and Jacques H. Mercier, New York, N. Y., assignors to G. M. E. Corporation, Brooklyn, N. Y., a corporation of New York

Application January 19, 1954, Serial No. 404,896

23 Claims. (Cl. 160—188)

1. A system of the character described comprising a pair of pivotally connected members, a hydraulic unit in each of said members mounted in opposed relation, each of said units having a reciprocable plunger, a reaction member, a pivotal mount for said reaction member, one end of each of said plungers being connected to the reaction member on opposed sides thereof respectively, whereby upon movement of said plungers toward each other, said connected members will be rotated about their pivotal mount, the effective area of one of the plungers against which fluid under pressure will react to move said plunger toward the other plunger being greater than the effective area of said other plunger against which fluid under pressure will react.

---



2,770,298

**FOLDABLE CLOSURE**

Wilbur L. Blair, Indianapolis, Ind., assignor to Sylvester, Inc., Indianapolis, Ind., a corporation

Application July 6, 1953, Serial No. 441,585

1 Claim. (Cl. 160—199)

A foldable closure movable between folded and extended positions comprising a series of upright closure panels each having a slot formed along its longitudinal edges, said slots being narrowed at their mouths, and hinges for equalizing the folding and unfolding action of said panels, said hinges connecting each panel to its adjacent panels and comprising a normally substantially V-shaped strip of resilient material, said strip terminating along its longitudinal edges in beads sized to be slidingly received within the slots of said upright panels, said beads having openings formed therein at their opposite ends, and means inserted within said openings for radially distending said beads into frictional engagement with the walls defining said slots.

---

2,770,299

**DRAPERY SUPPORTS**

Philip Rosenzweig, Detroit, Mich., assignor to Triangle Specialties Inc., a corporation of Michigan

Application December 6, 1954, Serial No. 473,479

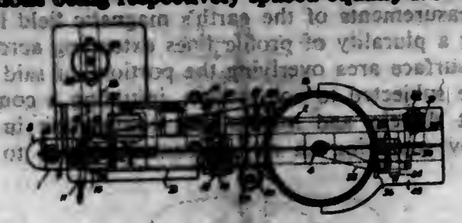
4 Claims. (Cl. 160—349)

1. A drapery heading support for supporting a drape having vertical pleats stitched together, comprising three vertically extending elongated single thickness wire fingers of substantially equal length joined at their lower ends, with the fingers, viewed in plan, defining a triangle, and an inverted U-shaped wire hook member outside the triangle, opposite one of the fingers, and having one end joined to the juncture of the three fingers, the fingers extending well above the hook member the fingers and hook member being integrally joined to form a unitary device.

---

2,770,300

**METHOD OF AND APPARATUS FOR FORMING SERRATED CUTTING EDGES ON SLICER BLADES**



Gordon Hill and Paul C. Bauer, Davenport, Iowa, assignors, by mesne assignments, to Bettendorf Bakery Equipment Company, Bettendorf, Iowa, a corporation of Iowa

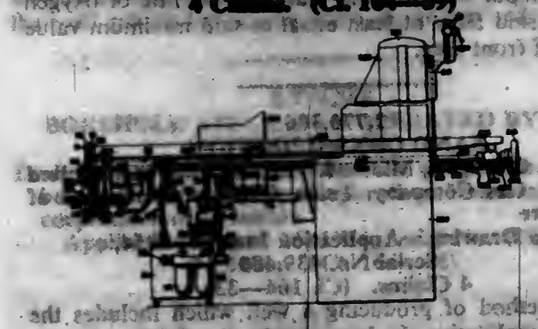
Application November 29, 1951, Serial No. 258,952

9 Claims. (Cl. 164—69)

1. The herein described method of forming equally spaced cutting teeth and intermediate scallops throughout an edge of an endless flexible hard steel band, which comprises punching a plurality of scallops in an edge of the band that are spaced apart a distance corresponding to an odd plurality of tooth spaces and punching identically spaced scallops in each of a series of subsequent punching operations, the scallops punched in successive punching operations being respectively spaced equally from scallops

punched in a previous operation a distance corresponding to two tooth spaces spaced scallops from the distance between said identically spaced scallops, and said punching operations being continued until cutting teeth and intermediate scallops are formed throughout the edge of said band.

---



2,770,301

**BACK GAUGE-PLANETARY GEAR-BRAKE DISCONNECT FOR HYDRAULIC DRIVE**

Frederick W. Seybold, Westfield, N. J., assignor to E. P. Lawson Co., Inc., New York, N. Y., a corporation of New York

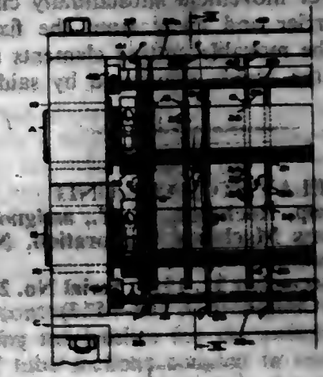
Application June 20, 1951, Serial No. 232,518

4 Claims. (Cl. 164—59)

1. In a paper cutter, having a horizontal table; a back gauge therefor; a longitudinal screw driving the back gauge; a hand wheel at one end of said screw; drive means for said screw; the invention comprising a connection between said drive means and said screw including a planetary gear and sun gear transmission; the drive means being connected to the planetary gear; the sun gear being rotatably mounted on said screw; an additional planetary gear arrangement between the first-mentioned planetary gear and the screw; apparatus for holding the first-mentioned sun gear stationary and causing the drive means to be connected through said first-mentioned planetary gear and said additional planetary gear arrangement to said screw, said drive means comprising a hydraulic motor, and means for releasing said sun gear to permit free rotation of said screw when said hydraulic motor is inoperative, whereby said screw may be readily rotated by said hand wheel.

---

2,770,302



**MACHINE FOR SHREDDING PAPER OR THE LIKE INTO STRIPS**

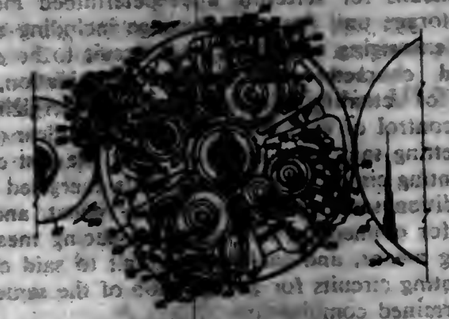
Florent T. Lee, San Francisco, Calif.

Application January 8, 1952, Serial No. 265,375

2 Claims. (Cl. 164—69)

1. In a machine for shredding paper or the like into strips, a frame, a pair of parallel shafts journaled at spaced complementary points in said frame, a plurality of spaced disc cutters mounted on each shaft intermediate said journals with the cutters on one shaft being interjacent the cutters on the other shaft, means for rigidly supporting said shafts intermediate the journal points and for maintaining the cutters in fixed relationship on said shafts comprising a plurality of combs mounted on each shaft, the combs on each shaft being interjacent the cutters on the same shaft and being opposite the cutters on the other shaft, the combs each having flat bases extended transversely of the shafts with the flat bases of the combs on one shaft extending parallel to the flat bases of the combs on the other shaft, said frame having an upper plate and a lower plate defining flat facing parallel surfaces, the flat bases of the combs on one shaft being seated on one of said surfaces, and the flat bases of the combs of the other shaft being seated on the other of said surfaces, means for connecting said combs to the respective shafts comprising a ring associated with each comb, each ring having a sliding fit with its associated shaft and a running fit with its associated comb and projecting outwardly of the comb on each side thereof to space each comb from the elements adjacent each comb on the associated shaft, said surfaces and bases being perpendicular to a line extending diametrically through both shafts and parallel to the normal line of feed of material to said cutters.

---



2,770,303

**APPARATUS FOR APPLYING CUTS IN ENVELOPE BLANKS AND THE LIKE**

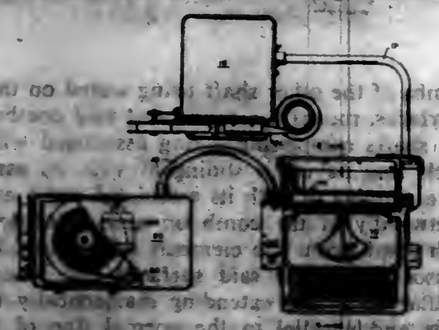
Richard Winkler, Remscheid, and Kurt Dünnebier, Neuwied (Rhine), Germany, assignors to Rockley Machine Company, Kansas City, Mo., a corporation of Missouri

Application May 24, 1952, Serial No. 289,708

11 Claims. (Cl. 164—64)

1. An apparatus for applying corner cuts in marginal side edges of rhombic shaped blanks wherein angular portions of the blanks provide the flaps of an envelope and the corner cuts define the point of the fold for the flaps, said apparatus including means for feeding the blanks individually and in successive order with the angular portions which form the bottom and closure flaps aligned with the directional feed of the blanks and with the angular portions which form the side flaps extending laterally, a carrier rotatable about an axis transversely of the directional feed of the blanks and forming a circular support for the blanks, laterally spaced cutting elements fixed on the carrier, said carrier having means engaging leading angular portions of the respective blanks to carry

a blank engaged thereby about said circular support with the marginal side edges overlying the fixed cutting elements, movable cutting elements for cooperating with the fixed cutting elements to make sheet cuts through said marginal edges, means for engaging the leading angular portions of the engaged blank to remove the blank from the carrier, and means for supporting the movable cutting elements for bodily support by the carrier along with the fixed cutting elements and for movement on the carrier in a radial direction through said edges of the engaged blank and then for movement substantially circumferentially on the carrier and away from the fixed cutting elements to get the movable cutting elements away from the blank when the blank is engaged by said removing means.



---

2,770,304

## RELAY STORAGE UNIT

Henry L. Thelstrup, Rochester, N. Y., assignor to International Business Machines Corporation, New York, N. Y., a corporation of New York

Application December 21, 1951, Serial No. 262,791
4 Claims. (Cl. 168—113)

1. In combination with a tape reading device, an electric typewriter and a tape punching device, wherein are located separate electric circuits representing the characters to be recorded by said typewriter and by said punch, means for inserting any given message or predetermined specific combination of characters to be recorded by said typewriter and said punch which was not found on said tape, comprising, means for producing electrical pulses of a proper duration and spacing for sequentially energizing said character representing circuits, means for selecting a predetermined message, a relay storage unit for each message including a pair of circuit energizing relays for each circuit to be energized in said character representing combination, circuit means for actuating said pair of circuit energizing relays under control of said electrical pulses, a clear-out relay for resetting said pairs of relays after the last character representing circuit of said message is energized in order to condition said storage unit for a repeat, and circuit means for connecting said pulse producing means, said selecting means, and said storage unit to said character representing circuits for energization of the same in said predetermined combination.

---

2,770,305

## UNDERGROUND COMBUSTION OPERATION

Sylvain J. Pirson, Tulsa, Okla., assignor to Stanolind Oil and Gas Company, Tulsa, Okla., a corporation of Delaware

Application September 2, 1952, Serial No. 307,548
4 Claims. (Cl. 166—4)
